THE

Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects:

1. The Psychology of the Cell—Introductory.
2. The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.
3. The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition; Predatory Habits of Certain Animalcula.
4. Colonies of Unicellular Organisms.
5. Fecundation of Proto-Organisms.
6. Fecundation of Higher Animals and Plants.
7. The Physiological Function of the Nucleus.
8. Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instanced, apart from the author's original investigations, the researches of Balbiani, Claparède and Lachmann, Maupas, Ribot, Haeckel, Engelmann, Espinosa, Pouchet, Weber, Pfeffer, Kent, Dujardin, Cruber, Nussbaum, Bütschli, Lieberkühn.

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Mr. G. J. Romanes, that the first appearance of the various physical and intellectual faculties is assignable to different stages in the scale of zoological development.

Review of Recent Work of THE OPEN COURT.
PSYCHOLOGY AND BIOLOGY.

- EXPERIMENTAL PSYCHOLOGY IN FRANCE. ALFRED BINET.No. 74.
- DREAM, SLEEP, AND CONSCIOUSNESS. DR. GEORGE M. GOULD.Nos. 74 and 75.
- THE CONDITIONS OF LIFE. PROF. WM. PREYER. No. 72.
- BODY AND MIND; OR THE DATA OF MORAL PSYCHOLOGY. FELIX L. OSWALD, M. D. . . .Nos. 72, 75, 78.

M. BINET'S entertaining sketch of the state of Experimental Psychology in France is the only direct and convenient source from which the reader can obtain a comprehensive idea of the contributions the author's country is making to this branch of mental science. The work of psychologists in France is distinguished by its almost exclusive bearing upon the pathological phases of psychological phenomena. The greatest successes of MM. Ribot, Richet, Charcot, and others, have been in treating the *diseases of the mind*.

The researches of Dr. Gould upon the nature of consciousness, as studied from the facts of sleep and dreams, are highly interesting, not only as affording suggestions of scientific value, but as exhibiting marks of an exact and cultivated introspective talent.

The concluding essay upon "The Conditions of Life," by Prof. Preyer of Berlin, treats of some important distinctions of modern biology.

Dr. Oswald's papers, in the series "Body and Mind," abound in entertaining and apt illustrations cited in support of his principles of moral physiology.

PHILOSOPHY.

- THE SELF-EVIDENT. DAVID NEWPORT.
- THE UNIFICATION OF RELIGION AND PHILOSOPHY. M. C. O'BYRNE.
- THE ASSAY OF ABSTRACT IDEAS. EDITOR.

FRIEND David Newport contributes to No. 73 of THE OPEN COURT a forcible article discussing "The Self-Evident." Mr. Newport's treatment is marked by a theological tendency, and the points wherein the philosophy of THE OPEN COURT differs from the theology of the author are touched upon in the editorial note, "The Assay of Abstract Ideas." Mr. O'Byrne's article, in the same number, is a scholarly sketch of principles whereon to base the unification of the truths of religion and philosophy.

- SENSATION AND MEMORY. EDITOR.No. 74.
- COGNITION, KNOWLEDGE, AND TRUTH. EDITOR. No. 76.

In these two discussions, the conditions and processes by which we start from the bare excitations of the sensory world and attain to knowledge, are unfolded. Sensation is the primal condition of all knowledge; the products of sensation are preserved and trans-

mitted as psychological forms; the psychological law of this receptive power is memory, from which source are evolved the different branches and varied forms of human thought.

- AXIOMS THE BASIS OF MATHEMATICS. DR. EDWARD BROOKS.No. 76.
- THE OLD AND THE NEW MATHEMATICS. EDITOR. No. 77.
- A FLAW IN THE FOUNDATION OF GEOMETRY. HERMANN GRASSMANN.No. 77.

In No. 76, Dr. Edward Brooks of Philadelphia, takes exception to an editorial thesis that "mathematics is unfortunately constructed on axioms." To Dr. Brooks no other way of construction is possible. There exist "*first truths or axioms* which the mind has power to cognize," which are incapable of proof, and which every system, even though nominally rejecting them, nevertheless tacitly employs. The editorial answer to Dr. Brooks, in No. 77, is based upon the principles unfolded in the series of disquisitions on "Form and Formal Thought," in Nos. 64, 66, 67, and 69. Axioms so called are the *result of reasoning*, and not the basis of it; the laws of formal thought determine the correctness and necessity of a proposition; conformity, in every instance, with these laws alone makes a truth universal; the relations of actual, material space have thus universally coincided with the laws of a formal system of third degree, and hence the rigidity and finality of those relations. In the same number, a translation from Hermann Grassmann's "Theory of Extension" is presented; it contains the fundamental points of departure of the new geometry from the old. No English version of this epoch-making work exists. The discussion will greatly interest those who have given their attention to the philosophy of mathematics.

SOCIOLOGY AND ECONOMICS.

- HENRY GEORGE AND LAND TAXATION. WHEELBARROW.No. 73.
- SYMPTOMS OF SOCIAL DEGENERACY. MONCURE D. CONWAY.No. 74.
- JIM THE INVENTOR. WHEELBARROW.No. 76.
- A GENERATION WITHOUT PROSPECTS. MORRISON I. SWIFT.No. 72.

WHEELBARROW opposes Mr. Henry George and the doctrine of Land Taxation with proper regard for the truth contained in the distinguished economist's theories. Objection is mainly taken to the universal curative power which the advocates of Land Taxation claim for their remedy. In man's obedience to moral laws Wheelbarrow finds the only magic wherewith to change the face of society.

"Symptoms of Social Degeneracy," Mr. Moncure D. Conway, finds to be not unrequent even in American civilization. We are prone to emphasize the survivals of barbaric institutions in effete Europe, while overlooking the excrescences of our own body politic. Lynch-Law, literary piracy, corruption in administrative circles, are signs of the decay of an ethical system and the theology that protects it. Worst of all, these evils are not unaccompanied with attempts at palliation.

ESSAYS AND CRITICISM.

- THE ETHICS OF ROBERT BURNS. GEN. M. M. TRUMBULL.No. 75.
- TRUTH AND FICTION. M. WILHELM MEYER.No. 76.

"In ease, fire, and passion," says Allan Cunningham, "Burns was second to none but Shakespeare." "He might have added," says Gen. Trumbull, "that as a lyric poet, as a national song writer, he was not excelled nor equalled by Shakespeare, nor by any other poet that was ever born. Burns had the divine gift of music in such excellence that he could put in tune all the different instruments of the great orchestra of man and force them all to vibrate in harmony."

THE STUDY OF SANSKRIT.*

BY H. OLDENBERG.

THE study of Sanskrit, the science of the antiquities of India, is about a century old. It was in the year 1784 that a number of men acting in Calcutta as judges or administrative officers of the East India Company, formed themselves into a scientific society, the Asiatic Society. We may say that the founding of the Asiatic Society was contemporaneous with the rise of a new branch of historical inquiry, the possibility of which preceding generations had barely or never thought of.

Englishmen began the work; soon it was taken up by other nations; and in the course of time, in a much greater degree than is the case with the study of hieroglyphic and cuneiform inscriptions, it has become ever more distinctly a branch of inquiry peculiarly German.

The little band of workers who are busy in the workshops of this department of science, have not been accustomed to have the eyes of other men turned upon their doings—their successes and failures. But, in spite, nay, rather in consequence of this, it is right that an attempt should be made to invite even the most disinterested to an inspection of these places of industry, and to point out and show to them, piece by piece, the work, or at least part of the work, that has been done in them.

There still lies formless in the workshops of this department of inquiry many a block of unhewn stone, which perhaps will forever resist the shaping hand. But still, under the active chisel, many a form has become visible, from whose features distant times and the past life of a strange people look down upon us—a people who are related to us, yet whose ways are so far removed in every respect from our ways.

We shall first cast a glance at the beginning of Indian research toward the close of the last century. We shall trace the way in which the new science, after the first hasty survey of its territory, at once concentrated its efforts to a more profound investigation of its subject and advanced to an incomparably broader plane of study. We shall, above all, follow the difficult course pursued in the study of the Veda, the most important of the literary remains of ancient India, a production with which even the works of the oldest Buddhism

are not to be compared in point of historical importance. Of the problems that this science encountered, of its aspirations, and of the successes that attended its efforts in solving difficult questions, we may venture to give a description, or at least an outline.

* * *

THE first effective impulse to the study of Sanskrit and Sanskrit literature was given by Sir. William Jones, who, in 1783, embarked for India to assume the post of Judge of the Supreme Court of Judicature at Fort William. The honor of having inaugurated a new era of philological inquiry, was heightened by the lustre and charm of personal character which this gifted and versatile man exerted upon his contemporaries. In prose and in verse Jones is extolled by his friends of both sexes as the phoenix of his time, "the most enlightened of the sons of men"—encomiums many of which a calmer and more distant observer would be inclined to modify. The correspondence and other memoranda of Jones, which exist in great abundance,* furnish the reader of to-day rather the picture of an indefatigable and euphuistic *dilettante* than that of an earnest investigator,—apart from the fact that he was alike sadly deficient in discernment and zeal.

As a young man we find Jones engaged in reading and reproducing in English verse, the works of Persian and Arabian poets; occasionally also with glimpses into Chinese literature. Then, again, a project of his own, an heroic epic—a sort of new *Æneid*, for which, and certainly with ingenuity enough, the Phœnician mythological deities were impressed into service—was to celebrate the perfections of the English constitution. On the journey to India this man of thirty-seven sketched a catalogue of the works, which, God granting him life, he hoped to write after celebrated models. These models were carefully designated opposite the separate projects of the outline. By the side of this heroic epic (after the pattern of Homer), we find a history of the war with America (after the patterns of Thucydides and Polybius), a philosophical and historical dialogue (after the pattern of Plato), and other plans of similar works.

* Edited by his biographer, Lord Teignmouth, and often given with more completeness than appears advisable considering the panegyric character of the biography.

* Translated from the *Deutsche Rundschau*.

With this feeling of omnipotent self-assurance, wholly untroubled with doubts, Jones was placed in India before the task of opening a way into the gigantic masses of an unknown literature, of a strange and beautiful poetry. He was as well qualified for the purpose (perhaps in a higher degree so) as many a more earnest and gifted scholar might have been.

The situation of affairs which he found in India forced it upon the European rulers of the land as a duty, to acquaint themselves with the Sanskrit language and its literature. The rapid extension and at the same time the redoubled activity of the English rule made it inconceivable that the existence of the old, indigenous civilization, and literature of the nation could long remain ignored or merely superficially recognized.

Preëminently did this necessity assert itself in the administration of justice, where the policy of the East India Company imperatively demanded that the natives should be suffered to retain as many of their laws and customs as it were possible to concede them. Already, in an act of parliament passed in 1772 in regard to the affairs of the company, a measure had been incorporated, at the suggestion of Warren Hastings, providing that Mohammedan and Indian lawyers should take part in court proceedings, in order to give effect to native laws and assist in the formulation of judgments. The dependence that thus resulted, of European judges upon the reliability or unreliability of Indian pandits, must have been trying indeed, to the conscientious jurist; for the assertions of Indian councillors as to the principles of the Law of inheritance, contract, etc., contained in the native books, were subject to no control.

Warren Hastings, in order to obviate the difficulty, had a digest made by several Brahmanical jurists—consults from the old Sanskrit law books, and this was translated into English. The undertaking had but little success, principally because no European was to be found who could translate directly from the Sanskrit. A translation had first to be made from Sanskrit into Persian and from Persian again into English.* The necessity therefore of gaining direct access to the Sanskrit language was unquestionable. The undertaking was not an easy one, though it was still quite different from such apparently impossible feats of philological ingenuity as the deciphering of hieroglyphic and cuneiform inscriptions.

The knowledge and likewise the use of Sanskrit in India had lived on in unbroken tradition.† There were countless pandits who knew Sanskrit as well as the scholars of the Middle Ages knew Latin, and who

were eminently competent to teach the language. It was easy to overcome the opposing Brahmanical prejudices. To become master, however, of the obstacles which emanated from the indescribably intricate and perverted grammatical system* of the Hindus, offered greater difficulties, which could be only overcome by patience and enthusiasm.

Just at the first moments of this trouble came the arrival of Sir William Jones in India. Immediately he was the central figure. From him came the founding of the Asiatic Society; from him, the impulse to a new revision of the Hindu law of contract and inheritance, this time undertaken on a surer basis. He assembled about him competent Brahmans versed in Sanskrit. In the year 1790 he wrote: "Every day I talk Sanskrit with the pandits; I hope before I leave India to understand it as I understand Latin."

It was not now a question of research, but of acquisition, of study; that clear and satisfactory results might rapidly be acquired, and that a proper selection of noteworthy productions of the Hindu mind might be made and presented before the eyes of all. Jones translated the most delightful of all Hindu dramas, the story of the touching fate of the penitent maiden, Sakuntala, who, in the sylvan quiet of her retreat was seen and loved by the kingly hunter, Dushjanta. This work, full of the most delicate sentiment, exhaling fragrance like the summer splendor of Indian Nature, was sung in his delicate rhythms by Kalidasa, of inspired eloquence.‡

Still more important than the version of Sakuntala was the publication of a second great work, which Jones translated, the *Laws of Manu*. It seemed as though a Lycurgus of a primitive oriental era had come to light; for this wonderful picture of a strange people's life was ascribed to the remotest antiquity—a description of Brahmanical rule by the grace of Brahma, magnified and distorted by priestly pride, in which the people are nothing, the prince is little, the priest is everything. In the face of such an abruptly accumulated mass of unexpected revelations, respecting an ancient civilization hitherto removed from all knowledge, how could one resist an attempt to give to that civilization and its language a place among known civilizations and languages? Wherever the eye turned weighty and pregnant suggestions offered themselves,

*The original complaint of Paulinus a S. Bartholomaeo, a missionary in India about the time of Jones, is well known.—"The devil, with a phenomenal display of ingenuity and craft, had incited the Brahmanical sages to invent a language so rich and so complex, that its mysteries might be concealed not only from the people at large, but even from the very scholars who were conversant with it."

†It was formerly thought, for reasons that have not withstood the assault of criticism, that Kalidasa flourished in the first century before Christ; it was the custom to compare him to the Roman poets of the Augustan era, whose contemporaries he in that event would about have been. In point of fact he must be assigned to an era several centuries later,—about the sixth century after Christ.

*Published in 1776, under the title, "A Code of Gentoo Law."

†This is the case at the present time. Compare, upon this point, Max Müller's "India what can it teach us" p. 78 et seq.

and with them the temptation to let fancy stray in aimless sallies. What is more, Jones was in no wise the man to resist such a temptation. The vocabulary and the grammatical structure of Sanskrit convinced him that the ancient language of the Hindus was related to those of the Greeks, Romans, and Germans, that it must have been derived with them from a common mother tongue.* But side by side with the conception of this incomparably suggestive idea, innumerable fanciful theories abound in the works of Jones, concerning the relationship of the primitive peoples, where everything was found to be in some way related to everything else. Now the Hindu tongue was identified with that of the Old Testament; now Hindu civilization was brought into connection with South American civilization. Buddha was said to be Woden; and the pyramids and sphinxes of Egypt were claimed to show the style of the same workmen who built the Hindu cave-temples and chiseled the ancient images of Buddha.

Fortunately for the new study of Sanskrit, the continuation of the work begun by Jones fell to one of the most cautious and comprehensive observers of facts that have ever devoted their attention and talent to the study of oriental literatures. This was Henry Thomas Colebrooke (born 1765; went to India 1782), the most active in the active band of Indian administrative officers. He officiated first as an officer of the government, and afterwards as judge, then as diplomatist—a man well versed in Indian agriculture and Indian trade. One can scarcely regard without astonishment the multitude of disclosures which, during the long period he devoted to Sanskrit, he was able to make from his incomparable collection of manuscripts. These to-day are among the principle treasures of the India Office Library. From the province of Indian poetry, Colebrooke, who well knew the limits of his own power, kept aloof. But in the literature of law, grammar, philosophy, and astronomy, he had a wide reading, which in scope may never again be reached. He it was who made the first comprehensive disclosure in regard to the literature of the Veda.

Colebrooke's investigations are poor in hypotheses; we may say he withheld too much from seeking to comprehend the historical genesis of the subjects with which he dealt. But he established the actual foundation of broad provinces of Hindu research. He himself was filled with wonder at the ever impenetrable vistas of that literature which were revealed, and our own wonder is increased by the sure and pa-

tient toil with which he sought to penetrate into those distant parts.

While Colebrooke was at the height of his activity, interest in Hindu inquiry began to be awakened in a country which has done more than any other land to make of Hindu research a firm and well-established science—in Germany.

For the discoveries of Jones and Colebrooke there could have been no more receptive soil than the Germany of that time, full of spirited interest in the old national poetry of all nations and occupied with the stirring movements rife in its own philosophy and literature. Apparently, indeed, the latter were closely allied to the spirit of the distant Hindu literature; for here too oriental romanticism and poetical thought sought no less boldly than the absolute philosophy of Germany, to penetrate to the primal and formless source of all forms. From the beginning, poets stood in the foremost ranks among the Sanskritists of Germany; for instance, the two Schlegels and Friederich Rückert, and beside these, careful and unassuming, the great founder of grammatical science, Franz Bopp.

In the year 1808 appeared Friedrich Schlegel's work, *Ueber die Sprache und Weisheit der Inder* (The Language and Learning of the Hindus). From what was known to him of Hindu poetry and speculation, and according to his own ideas of the laws and aims of human inquiry, Schlegel, with a warm and fanciful eloquence, drew a picture of India as a land of exalted primitive wisdom. Hindu religion and Hindu poetry he described as replete with exuberant power and light, in comparison with which even the noblest philosophy and poetry of Greece was but a feeble spark. The time from which the masterpieces of the Hindus dated, appeared to him a distant, gigantic, primeval age of spiritual culture. There was the home of those earnest teachings, full of gloomy tragedy, of the soul's migration, and of the dark fate which ordains for all beings their ways and their end:

"Obedient to this purpose set, they wander, from God to plants;
Here, in the abhorred world of existence, that ever moves to destruction."

While Schlegel gave to the world this fanciful picture of Hindu wisdom, highly effective from its prophetic perspectives, but still wanting in sober truth, Bopp applied himself, more unassumingly, but with an incomparably deeper grasp and patient sagacity, to investigating the grammatical structure of Sanskrit; and, on the recognized fact of the relationship of this language with the Persian and the principal European tongues, to establishing the science of comparative grammar. In the year 1816 appeared his *Conjugationssystem der Sanskritsprache in Vergleichung mit jenem der griechischen, lateinischen, persischen, und germanischen Sprache* (Conjugational System of the Sanskrit Language in Comparison with that

*The identity of Hindu words with those of Latin, Greek, and other languages had been noticed by several before Jones, and likewise the correct explanation of this phenomenon, namely the kinship of the Hindu nation with the Latins and Greeks, had been declared by Father Pons as early as 1740. For fuller account, see Benfey, "History of the Science of Language," (*Geschichte der Sprachwissenschaft*) pp. 222, 333-341.

of the Greek, Latin, Persian, and Teutonic Languages).

This was no longer merely an attempt to find individual similarities in the sounds of words of the related languages, but an attempt to trace back not only uniformities but also differences to their fixed laws; and thus in the life and growth of these languages, as they sprang from a common root and evolved themselves into a rich complexity, to discover more and more the traces of a necessity dominated by definite principles.

We can here only briefly touch upon the investigations made during the last seventy years, for which Bopp laid the foundation by the publication of his work. Rarely have such astonishing results been achieved by science as here. Elucidative of the early history of the languages of Homer and the old Italian monuments before they acquired the form in which we now find them written, the most unexpected witnesses were brought to give testimony; namely, the languages of the Hindus, the Germans, the Slavs, and the Celts. Of these related tongues, the one sheds light upon the obscure features of the others, just as natural history explains the stunted organs of some animals by pointing out the same organs in their original, perfect form, in other animals.

The picture of the mother tongue, whose filial descendants are the languages of our linguistic family, was no longer seen in merely vague or doubtful features. The laws under whose dominion the system of sounds and forms in the separate, derived languages have been developed from the mother tongue, are being ascertained ever more fully and formulated ever more sharply.

From the very beginning the essential instrument, yes, the very foundation of this investigation, was the Sanskrit language. In the beginning, faith in the primitiveness of Sanskrit in comparison with the related languages was too strong. During the last few years, however, this erroneous conception has been fully rectified; and this in itself is a decided step in advance. We know now that the apparently simpler and clearer state of Sanskrit in sounds and forms is in many respects less primitive than the complicated relations of other languages, *e. g.*, the Greek; and that we must often set out from these languages rather than from the Sanskrit, in order to make possible the explanation of Sanskrit forms. Thus Sanskrit now receives back the light which it has furnished for the historical understanding of the European languages.*

* It may be permissible here to illustrate this reversion of methods in a single point that has become of especially great importance to grammar. The Greek has five short vowels, *a, e, o, i, u*. The Sanskrit has *i* and *u* corresponding to *i* and *u*; but to the three sounds, *a, e, o* corresponds in Sanskrit only a single vowel *a*. Thus, for example, the Greek *αφο* (English, *From*) reads in Sanskrit *afā*; the *a* of the first syllable, and the *o* of the second syllable of the

I must not attempt to follow in detail the course which the science of comparative grammar, apart from its connection with Hindu research, has taken. While the two branches of the study were rapidly advanced by Germans particularly, and likewise in France by the sagacious Bernouf, new material kept pouring in from India no less rapidly. In two countries on the outskirts of Indian civilization, in the Himalayan valleys of Nepal, and in Ceylon, the sacred literature of the Buddhists, which had disappeared in India proper, was brought to light in two collections, one in Sanskrit and one in the popular dialect Pali. The ingenuity of Prinseps succeeded in deciphering the oldest Indian written characters on inscriptions and coins. In Calcutta was undertaken and completed in thirty years the publication of the *Mahabharata*, a gigantic heroic poem of almost a hundred thousand couplets, in whose vast cantos with their labyrinth of episodes and sub-episodes many generations of poets have brought together legends of the heroes and days of the olden time, of their struggles and tribulations.

The sum and substance of all this newly-acquired knowledge has been incorporated in the great work of a Norwegian, who became, in Germany, a German—in the *Indische Alterthumskunde* (Hindu Antiquities) of Christian Lassen.

Lassen did not belong to the great pioneers of science, like Bopp. It must also be said that often that sagacity of philological thought is wanting in him, which sheds light on questions even where it affords no definite solution of them. And, indeed, was it not a herculean undertaking, a work like that of the Danaides, to explore the older periods of the Hindu past when, as the chief sources of information, one was solely limited to the great epic, and the law book of Manu? Even a surer critical power than Lassen possessed could not have discovered much of history in the nebulous confusion of legends, in the invented se-

Greek word is thus represented in Sanskrit by *a*. Or, to use another example, the Greek *ίνος* (English, *courage*) is in Sanskrit *manas*; Greek *εφερον* (I carried)—*abharan*. What now is the original, *i, e*, what existed in the Indo-Germanic mother tongue for the three sounds of the Greek *a, e, o*, or the single sound of the Sanskrit *a*? When scholars began to study comparative philology and to dissect Sanskrit forms they thought the *a*—and this was a conclusion apparently supported by the simplicity of the language—to be alone the original sound; and were led to believe that this vowel was later divided on European soil into three sounds, *a, e, o*. Investigations of the most recent time—and for these we are to thank Amelung, Burgman, John Schmidt, and others—have shown that the development of the vowel system took the opposite course. The vowels *a, e, o* were already in the Indo-Germanic mother tongue, and in Sanskrit, or more accurately, before the time of Sanskrit, in the language which the ancestors of the Indians and Persians spoke when both formed one people, these vowels were merged into a single vowel. Thus the *e* of *εστι* and the *o* of *αφο* are more original than the *a* of *αφι*, *αφα*.

Now, we find in Sanskrit that where the Greek *e* corresponds to the Sanskrit *a*, certain consonants preceding this vowel, *as, e, g, k*, are affected in a different way by the latter, than in instances where for the *a* of Sanskrit the Greek *a* or *o* is used. From the linguistic form of Sanskrit alone, which in the one case as in the other *as*, it would not be intelligible why the *k* should each time meet a different fate. The Greek, in that it has preserved the original differences of the vowels, gives the key to an understanding of the peculiar transformations which have taken place in the *k*-sound in large and important groups of Sanskrit words.

ries of kings in *Mahabharata*, and in that colorless uniformity which the style of the Hindu Virgils spreads unchangeably over the enormous periods of time of which they assume to inform us. In spite of this, Lassen's *Antiquities*—the work of tireless diligence and rare learning—stands as a landmark in the history of Hindu investigations, uniting all the results of past time, and pointing out anew, by the very things in which it is lacking, still untried undertakings.

Just at this time, however, when the first volume of Lassen's work, treating of the earliest periods, appeared, came the beginning of a movement which has severed the development of Hindu studies into two parts. New personalities appeared upon the scene and pushed to the front a new series of problems, for the solution of which an apparently inexhaustible, and to this day, in a certain sense, a still inexhaustible supply of freshly acquired material was offered. This was the most important acquisition that has ever been added to our knowledge of the world's literature through any one branch of oriental inquiry—the acquisition of the *Veda* for science. (To be continued.)

ASPECTS, CHRISTIAN AND HUMAN.

BY WILLIAM R. THAYER.

I.

ACCUSTOMED as we are to dub ourselves Christians, we are apt to take it for granted that those changes which have been wrought in modern society—for its improvement, as we hope—have proceeded from influences essentially Christian; but the facts of history do not warrant this assumption. When civilization awoke in Italy during the 14th and 15th centuries, it was no Christian messenger, but a Classic, who roused the sleeper from the long night of monkish lethargy and the bloody nightmares of feudalism. The Reformation in Northern Europe was truly a Christian revival; but it could not have succeeded save for the preparation of the pagan renaissance which freed the intellect and stimulated criticism. When our American Republic was established, with a Constitution which, some complain, ignores God, its founders turned to antiquity, and especially to the records of the Greek commonwealths, for counsel and precedents: and the founders themselves—Jefferson, Franklin, perhaps even Washington—should be classed among liberal thinkers, rather than among Christians. No disciple of Christ, but Voltaire, Rousseau, Diderot, and D'Alembert—avowed sceptics—launched the regenerative ideas in France, and Mirabeau, the skilfullest pilot of the French Revolution, stricken down as the ship entered the rapids, was an unbeliever: and in the excesses of that Revolution, the French attempted, almost childishly, to resuscitate the social and political systems of republican Rome. Frederick the Great, who drilled Prussia

in her rôle of unifier of Germany, scoffed at religion. Goethe, who raised the German into the company of the world-literatures, early cast aside the Christianity of his time, and was most powerfully quickened by Hellenic thought.

Coming to our own century, how many of the leaders of broadest influence, how many of the personages of typical significance, have worked consciously on Christian principles, or have professed themselves Christians? Byron, a most important symptom, "though he taught us little"; Shelley, the enthusiastic lover of humanity, who saw the contagion, but died before he had discovered the antidote; Keats, the great soul, fired with Olympian draughts,—these were not Christians. Nor can we class as such those who have labored in other fields: Carlyle, Mill, Harriet Martineau, George Eliot, Darwin, Spencer. What Christian sect would welcome to its communion those of widest repute in France,—Hugo, George Sand, Balzac, Comte, Renan, Taine? In Russia, Pushkin and Turgeneff had no religion, and Tolstoy, who has lately earned from Christians the reputation of madman because he has renounced wealth and aristocratic position to live in humility and poverty according to the letter of Christ's command, reveres only the human Christ. This is not the only instance when self-styled Christians have been startled to the verge of contempt by a Christ-like purpose. When Gladstone summarily ended an unjust war begun by his predecessor, he met with strange criticism from the Christian world: part of which sneered at his weakness and sentimentality, and part insinuated that this sanctimoniousness marked a shrewd political ruse. Yet Gladstone is almost the only Christian statesman of the age; Disraeli, who divided with him the admiration of Britons, was no Christian. Bismarck, the maker of United Germany and arbiter of Europe, not only does not himself practice, but mocks as visionaries those who propose to practice the simplest of Christ's admonitions: "Do harm unto others before they can do harm unto you," is the Bismarckian version of the Golden Rule. Gambetta, who for ten years embodied the political whims of the majority of Frenchmen, was an infidel. And if we search the religion of those diplomatists who have turned Europe into a vast camp, we shall not find Christianity to be their inspiration. Look impartially at the methods of trade and statecraft; how largely are they shaped by current creeds! There is more truth than he intended in the remark of that New York broker who said: "God can run things up-town on Sunday; but on week-days, in Wall Street, I take care of myself."

So much must be said, not for the purpose of cheapening the preciousness of Christ's example, but for the purpose of seeing facts as they really are in Christianity as an actual institution. As we are all care-

lessly called Christians; we seldom inquire how many deserve the title, and we accept whatever makes for progress as the fruit of Christian endeavor. But even this cursory r evue shows that many men and women whose work benefited mankind, openly disavowed allegiance to Christianity, and that their efforts were often hindered, often bitterly persecuted, by professional Christians, who now accept the beneficent achievements, and forget the antagonism in belief. So Romanists have ever been eager to claim the most vehement infidels—the Voltaires and Leopardis—as death-bed converts to Romanism. A futile deception! We rate an institution by the character and conduct of those who zealously work out its principles; not by the imposing list of illustrious men who figure as honorary members. Until those who are both *lip* and *heart*-Christians bravely face the fact that a large number of the most intelligent and virtuous men and women live and labor outside of the pale of Christianity, and until they seek resolutely and honestly for its causes, denunciations of infidelity from the pulpit and exhortations to faith, will be as barren as they have been hitherto, and actual Christianity will deserve but a fraction of praise for making men purer, better, happier.

One of these causes is that the clergy of whatsoever denomination are generally behind, rarely abreast, and never ahead of, the needs of the age. Depending chiefly on tradition, they are natural conservatives. They utter, not what has come as a direct inspiration to them, nor even what was revealed, vital and urgent, to Christ; but what Paul, Augustine, Aquinas, Calvin, Luther, Laud, Wesley, and others, thought about Christ's inspiration. They are echoes of echoes. The carcass of such opinions remains, a mummy embalmed in dogmas: the spirit exhaled with the decease of that society to which those opinions were particularly addressed. We are never careful enough in making allowance for the intangible potency of the *Zeitgeist* which diffuses a similarity of perceptions through all the people of certain epochs or communities. The same hot sun which pleaches the woods with leaves and the meadows with verdure in May, withers the foliage and seres the grass in August. Your ablest Grecian can never know what subtle meaning may have been associated in the mind of a Periclean Greek with a verse of Pindar or Aeschylus; the words stand, but the allusion has vanished, like the fragrance of a pressed flower. So, too, the texts of creeds survive, but who shall conjure back those mental conditions to which those creeds came as the breath of life? We read the war-cries which roused English armies to indomitable enthusiasm at Crecy and Agincourt; we repeat the songs which, less than a generation ago, reverberated through the camps and battle-fields of

the Potomac and Mississippi,—but we are only mildly thrilled. The Greek *p an* which terrified the barbarians, has no terror for us. How many clergymen still mumble battle-calls which lost all vitality to rally friends or frighten enemies, centuries and centuries ago?

Regret it as we may, blind ourselves to it if we will, the primal, inexorable law of life is motion, is change. To march perpetually—that is the condition of our existence. Our bivouacs are but for a night; our halts but for a noon: then up, and onward. During untold ages the army of mankind has pursued its way: led now by a Moses, it flounders through sandy deserts; led now by a Napoleon, it winds serpentine over Alpine passes; led now by a Darwin, it peers into geological quarries and explores prehistoric caves. Sometimes, in crossing a pleasant country, it dreams of a prosperous repose; anon, it pushes forward, perhaps to lose itself in a new wilderness, and the cry of the preacher floats mournfully upon the wind: "What profit hath a man of all his labor which he taketh under the sun?" Sometimes, it doubles on its tracks, and reads in a heap of blanched and crumbling bones the record of a battle fought long ago. That ancient myth of him who set forth in quest of the Lost Beautiful is no myth, but very reality, the prophetic chronicle of mankind's career. The weary, the straggler, the disheartened, drop away, and are heard of no more. The indolent retreat to some Capua, where they too perish. Only the robust survive. Rest, the fair capital of the Promised Land towards which we strain, flies ever before us: scarcely at long intervals visible in alluring mirage above the horizon. "Thou shalt not pause," is the command issued to us all; and Time, the indefatigable, runs beside us and sets the pace.

Change, therefore, O clergy, is a law, you also cannot evade. Human nature, we affirm with reason, is always the same; but each individual is a new combination of its elements. Change crept in at his making, and must be respected. Likewise, the law of gravity is assumed to be fixed, but each manifestation of it differs from every other. The physicist subdues friction to serve one purpose; attraction, centrifugality, tension, cohesion, to serve others: so should the moralist perceive that different virtues, and their complimentary vices, belong to different epochs and temperaments. And if he be wise, he will not equip himself from the armory of superstition and miracles, in order to enter the lists against enemies in an age of criticism.

During social and political upheavels, poets have been more alert than preachers to foresee the impending change. In the generation before our Civil War, while as yet but faint support came to Abolitionists from northern pulpits, Lowell and Whittier were vent-

ing in poems those torrents of indignation which, broadening and deepening, swelled into a flood before which the dam of slavery was swept into the abyss. The poet is free. No social tie binds him; no selfish interests intimidate him. What the voice in his inmost soul whispers, that he must utter, be the consequences what they may. Since the world expects nothing from him, he does not—even insensibly—tune his words to the world's expectation. Like a heaven-deputed inspector, he passes through society, and reports upon it. Men involuntarily reveal their secrets to him; he observes their passions, he listens to their opinions: and when he publishes his report, they are surprised, and cry out incensed against this betrayal of confidences; or they deny that the case is as bad as he has stated. Free and fearless, then, must the poet be; himself often but half-aware of the mission on which he is bent.

But the clergyman enjoys no such freedom. His training, his associations, the invisible tethers of tradition, determine and limit his activity. He relies upon established methods. His congregation, bred in a particular doctrine, chose him to preach to them because he too was bred in that doctrine. Which of us is free from that intellectual vanity which is flattered by repeated and varied assurance that what we deem to be the truth, is the truth? Which of us is not tickled when our prejudices are justified to us every Sunday in the sermon, and every week-day in our favorite newspaper? Be he never so honest, the professional preacher, no less than the professional politician, will strike the chord which long experience has shown his hearers prefer. Every assembly re-acts upon a speaker by a process so subtle that no analysis has yet traced it. Actors assure us that when they enter the stage, they feel immediately whether the audience is with them or not. But besides this inevitable hindrance to perfect freedom in clerical utterance, there are others quite as coercive. To all persons who thrive by existing institutions—in church, in government, in education, in commerce—the New is suspect. "We have tried the Old, and it has served thus far," say they; "novelties will certainly bring discomforts, perhaps danger, or disaster." Then, too, where heavy emoluments are attached to religious places, there will be a lively, unedifying scramble. Piety is not always the incentive which spurs men to take orders. How many aspirants in England are confirmed in their vocation by remembering that the Archbishop of Canterbury enjoys a stipend of twenty thousand pounds sterling, *plus* innumerable fat perquisites, and a social rank next to the royal family? Do all Romish priests forget that Cardinal Antonelli found religion so profitable, that he left a fortune of eighty million francs to be fought over by his illegitimate children

after his death? My imagination refuses to picture John the Baptist, or Christ, or the sturdy fisherman Peter, as master of Lambeth Palace, or sovereign of the Vatican: yet those who presume to call themselves the successors of Jesus, still trick out their presumption in these temporal, unreligious splendors. To the election of a pope there goes as much bickering, and jealousy, intrigue and wire-pulling, and often bribery, as to the nomination of an alderman at a ward-caucus; not fitness and holiness, but influence, but expediency, but compromise, determine who shall wear that tiara, which, more wonderful than the wishing-cap of Fortunatus, suddenly endows its wearer with every virtue and with omniscience! And the incongruities of Anglicanism or of Romanism have their counterparts in the methods of the other Christian sects; and the existence of such methods shows that to the vast majority of Christendom an immediate spiritual relation with the Supreme Spirit is still impossible, and will be impossible as long as men must be dazzled by the gilded mummeries and melodramatic pageants of feudal courts and modern theatres. As soon seek for justice from a Bourbon, or for mercy from a Romanoff, as for authentic, vital, religious inspiration from the prelates of Established Churches. Spiritual reforms begin outside of the congregation, as political reforms begin outside of Parliament and Congress. Not the preacher, but the poet; not the politician, but the untrammelled agitator,—men whose tongues were free, and whose hearts were fearless, have been the heralds and champions of better things.

MARCH 4.

BY LOUIS BELROSE, JR.

OUR fathers, when the land was young,
Were like their children, good and bad:
The names that live on every tongue,
Were but the best they had.

They knew and called the knave a knave;
They knew and called the fool a fool;
And none so stupid but he gave
His voice that wisdom rule.

So master-builders raised the state
On sure foundation, stone by stone;
The worst ambition of the great
Was such as men might own.

But with the change of passing years
From honest difference came the strife
That filled the land with blood and tears,
And sapped the nation's life.

From out the vilest passions, freed
By civil war and uncontrolled,
We took to govern us the greed
And worship of the greed of gold.

Thrust from the temple of her choice,
Fair freedom veils her face, and leaves
The money-changers to rejoice—
Who make her house a den of thieves.

O, Spirit of the time gone by,
When virtue was a jewel worn
In public place—before the sky
Had blushed for honor laughed to scorn;

Hope of the valiant few that stand
Against the rising tide for thee,
Come forth with power in thy hand
And turn despair to victory!

Unfurl the banner in whose folds
Are duty shining like a star,
And courage of the heart that holds
Nor needs the wasting goad of war.

O, come with Wisdom by thy side;
We grope for knowledge in the dark;
We seek the way without a guide,
And rush confused at every spark.

Come with the sacred torch alight,
Whose rays divide the false and true,
That those who love may know the right,
And those who will may do.

CORRESPONDENCE.

MENDACITY OF OLD SOLDIERS.

A RETORT TO THE COMMUNICATION OF DR. HORACE POTTER.

To the Editor of THE OPEN COURT:—

SINCE old Burton's quaint and wise "Anatomy of Melancholy" was given to the world, we have had nothing quite so curious as Dr. Porter's pathology of martial mendacity. As an old soldier I shall stand by my order, and maintain that when "one of the great daily newspapers" charged the soldiers of the late war with chronic mendacity, the newspaper itself was mendacious. I confess that I have known a few old soldiers, who, as Falstaff says, were "given to lying," but they belonged to the war of 1812. Dr. Porter's diagnosis is worthless, because based on an imaginary disease. It is a calumny on the veterans to say that they have an impediment in their veracity.

I do not deny that some of us are afflicted with a "retrograde metamorphosis of our hemispherical ganglia," which I suppose is Greek for corns and bunions, but they are simply the result of hard marching in "contract" shoes. They provoke profanity occasionally when somebody treads on them, but not mendacity.

I suppose the charge of mendacity grows out of the war history published in the *Century Magazine*. Those pictorial fables were written by generals and admirals when debilitated by "neurokinesis." The whole army ought not to be held responsible for their vivid imaginations.

To excuse the old soldiers for fictitious faults because they suffer from "degeneration of nerve-structure" is like pitying an army mule for his bashful voice. The "nerve-structure" of the old veterans is of the firmest texture and best material. Every nerve is catgut. If we don't get what belongs to us it is not because we lack the "nerve" to ask for it. It has been falsely charged upon us that we "want the earth." We do not; all we want is the American part of it, and we shall always have nerve enough to demand that. If there is one special quality that we excel in it is "nerve." If we have any spots about us particularly healthy they are our "nerve-centers." Dr. Porter need not worry himself about them. If he will diagnose us again he will find that our "cerebral neurine" is in fine condition.

Mendacity is not a nervous disease. It is a vice predominant in children who are brought up in fear of punishment; in slaves, for the same reason. In fact, the reason why a gentleman resented

the lie by a blow, or a challenge to mortal combat, was not that it reflected upon his moral character, but upon his birth, and his rank in society. Lying was the refuge of menials and serfs. To give a man the lie was to give him the ignoble status of a slave. Mendacity also springs from cupidity, as in merchants and traders; from revenge, as in malicious persons; from political necessity or to excite curiosity, as in newspapers; and from hundreds of other causes, not at all related to nervous disease; nervousness may be the effect of lying, but it is not the cause of it.

Lying is a moral weakness epidemic in civilized or commercial man. It is not an affection of the physical nerves. Traders are not especially nervous people, and yet no man but a fool pretends to rely on their mercantile word. Every buyer relies upon his own judgment as to the cost, quality, quantity, and purity of what he buys. Nearly every descriptive label in a store is a liar. Where is the garrulous old soldier who can compare in eloquent mendacity with a clerk in a dry-goods establishment or with a salesman in a clothing store?

Farmers are not nervous people as a rule, and yet one of the chief luxuries of my early life was to sit on a rail fence and admire the mendacious genius of a couple of them when circumventing each other in a horse-trade. It was a treat that ranked next after Robinson Crusoe, and above Gulliver, Munchausen, or the Arabian Nights. For inventive reach, fertility of resource, nimble shifting, and efflorescent description sanctified by solemn oaths and strengthened by deceptive warranty, there is nothing in the story-books so ingenious in falsehood as a sweetly pastoral horse-trade. Overpowered by its rural simplicity the old soldiers tell truth in despair, because they know they cannot compete in mendacity with bucolic ability and skill.

That one of the great daily newspapers of the country should reproach the old soldiers for their tendency to mendacity is a "raise" of such colossal daring and amount, that every old veteran lays down his hand and immediately quits the game. There is not an army corps that can compete in mendacity with any one of the great daily newspapers of the country. I know of nothing in moral existences that so much resembles Niagara Falls as the flood of mendacity which continually pours over the hard, rocky forehead of the daily press. I shudder when I think on the purgatory of editors. Every improvement of the printing-machine multiplies their punishment as it multiplies their mendacity. The plea of "neurokinesis" will not shorten their term by a single day.

When an old veteran tells a lie, the recording angel debits it against him as one sin, but when an editor prints a lie, the falsehood is multiplied by the "sworn circulation" of his paper, and debited against him in gross. For instance, if the circulation is 20,000 copies, then every lie printed in any edition is properly charged as 20,000 lies.

I am well acquainted with the editor of one of the "great daily newspapers" whose printed falsehoods I will estimate at only ten per day, although the actual figures are very much higher than that. The daily circulation of his paper is about 20,000 copies, excepting Sundays, when it reaches 50,000. In the eternal domestic book, or book of doom, he is charged with 200,000 acts of mendacity per day and half a million for every Sunday. He has been an editor for thirty years, so that it becomes a feat of logarithms to calculate the sum total of his delinquency.

Now, if there is not in the moral universe any forgiveness of sins until expiation done, and if there is a purgatory to execute the law, wherein every soul must endure a certain term of imprisonment for every sin done in the body, I tremble for my old friend, the editor. He and I often spend a pleasant hour together smoking our cigars and settling the affairs of the nation, but I never shake hands with him at parting without a presentiment that when all the other editors of his generation have expiated their mendacity and have been received into paradise, he will still be "doing

time," because the circulation of his paper is so much larger than theirs, and because he has been so much longer in the business.

Besides, what harm is there in the romances old soldiers tell concerning "the battles, sieges, fortunes," which they have passed, unless indeed, like Othello, they enchant young ladies by the spell of them! A hundred of their fictitious tales of bravery and death are not so sinful all together as one calumny that wounds an innocent man or gives pain to his wife and children. Think of the load a man must carry to judgment who bears false witness against his neighbor two hundred thousand times a day, and a half a million times on Sundays; and yet there are editors who break the ninth commandment more times a day than that, and then have leisure to write editorial articles deploring the mendacity of old soldiers.

M. M. TRUMBULL.

LAND AND LAND VALUES.

To the Editor of THE OPEN COURT:—

WHEELBARROW says that Henry George "forgets that land has no value aside from labor."

The writer mistakes, unintentionally, George's position. George says that almost all the value of land comes from the growth and labor of the community and not from the individual who legally owns the land.

For example, in a community of 10,000 people the value of a man's bare land, exclusive of the improvements, etc. on it, comes from the labor and presence of the 10,000 people. The so-called owner creates, under favorable circumstances, only the one-ten-thousandth part of the increase, and, if he is an absentee landlord, he makes not even that fraction of the value.

Now if you tax the value of land you are taxing the labor of the whole community, slightly, and the natural opportunity and growth of the community; but as the taxes are expended on the community—for the growth of the community—nobody is injured and the growth pays for the growth.

LYNCHBURG, VA.

THOMAS WILLIAMSON.

THE MASSES DISINHERITED.

To the Editor of THE OPEN COURT:—

* * * MR. GEORGE nowhere speaks of taxing land, what he would tax is land values, or the rental value of land. It may be asked what is meant by the rental value of land, and it is proper that it should be explained right here. Rent is the price paid for the privilege of access to the raw material of production, for the mere privilege of getting hold of something not created by man, out of which labor and capital can create wealth. Now the first thing necessary to an understanding of what Mr. George advocates is to bear in mind that he never hinted at the abolition of rent, or to vary any of its economic effects whether good or bad. He simply proposes to divert the flow of rent from private into public channels. Wheelbarrow's assertion, therefore, that "if only land should be taxed apart from improvements, many lots on the lake side of Chicago should be free of taxation, for they consist only of improvements" falls to the ground, because improvements upon land are now and would be then permitted only upon condition that their owner will pay the ground rent, that is the annual value of the use of that particular land, for the most valuable purpose to which any one cares to apply it. At present this rent is usually capitalized and is then called its price. But this is not always done. Some of the most desirable land in New York and Chicago, Philadelphia, London, and other great cities, is built upon by the lease-holders. The owner of the improvements pays the annual value of the land to the free-holder. Under Mr. George's system he would pay it to the municipality. In either case he must pay it or lose his improvements.

Wheelbarrow further says: "Moreover, are not those who have invested their capital, *i. e.*, their stored up labor, in land, en-

titled to be protected in their possession acquired under our present system?" Well, who talks or thinks of disturbing them in their possession? Certainly not Mr. George. He demands that the landlord be left in undisturbed possession with every motive to collect his rent in full, but that the State shall then concentrate all its taxes upon the landlord, and compel him to pay over to the State all which he collects under the name of rent, except a commission sufficiently large to induce him to remain in the business of a landlord or rent collector.

Again Wheelbarrow does not seem to see how any relief would be afforded the poor by this change in the method of taxation, and asserts that the consequences which Mr. George claims would result from a single tax on land values are "fantastical." Let us see if they are "fantastical."

Whereas, under the present system, all tenants, that is to say the overwhelming majority of the people of any country, have to pay first, rent, and then an amount of taxes nearly equal to the rent in addition, the proposed change would leave them nothing to pay but their rent, while the men to whom they pay the rent would have to pay all taxes which the tenants now pay. In other words tenants, that is, the millions, God help them! whose toil is so illy required, pay two taxes of nearly equal amount, one called rent and the other taxes. Under the system propounded by Mr. George they would pay only one tax instead of two, and thus half of their present burden would be lifted from their shoulders.

But that would not be all. By abolishing taxes upon industry and the products of industry, and by concentrating them upon land values to their full amount, it will render it impossible for any man to exact from others a price for the privilege of using those bounties of nature in which all living men have an equal right of use, it will compel every individual controlling natural opportunities to either utilize them or abandon them to others, thus providing opportunities of work for all men and secure to each the full reward of his labor. As a result of this it is too much to claim as Mr. George does, that involuntary poverty will be abolished and the greed, intemperance, and vice that spring from poverty and the dread of poverty, be swept away? I think not.

Finally Wheelbarrow says:—"Land taxation, even if it had in its consequences all the impossible blessings it is supposed to have according to Mr. George, would be of no avail to him who believes that he is the mere product of circumstances, and who does not know that a man's character is the most important factor among the conditions that shape his fate. If a man is aware of that, he will dare to become the master of the circumstances that surround him. I know of one panacea only, it is man's obedience to the moral law." Indeed? Well, is not Mr. George's arguments from beginning to end a plea for the application of the "Moral Law?" All around us is distress and misery, want, poverty, and crime. In the very centres of our civilization to-day, "women faint and little children moan." What is responsible for this? Surely the law. Either human law or Divine law that is certain. To say that it is in obedience to Divine law is in my opinion simple blasphemy. No! the cause of that poverty, the cause of that starvation, distress, and monstrous want in the very centres of wealth, of ignorance in the midst of enlightenment, of the direct abasement and degradation in the midst of the highest civilization, comes from the single fundamental fact that the masses of the people have been disinherited. Charity may exert itself and contribute its thousands, philanthropists may hold conventions. Schools and institutes for the education of the masses may be established. Knights of labor may agitate, petition, and strike. Ministers of the gospel may wax eloquent on the sermon on the mount and the fadeless glory, and immortal beauty of Christ's message to men, but all in vain. It is like trying to sweep back the surges of the ocean with a broom, until you go to the root of the evil. So long as a man is a land animal, so long as he can only live on land

and work on land; so long as all wealth is simply the raw material of the land worked up by human labor, then it is inevitable that if the land of any country be treated as the absolute property of one class of that country no matter how they advance, no matter what inventions may be made, what improvements may be carried out, there must be at the bottom of the Social Scale ignorance, degradation, vice, want, and starvation.

This is as clear as the sun at noon-day. I suggest that Wheelbarrow read *Progress and Poverty* once more.

MILWAUKEE, Feb. 6, 1889.

PETER MCGILL.

A SINGLE TAX MAN IN DISGUISE.

To the Editor of THE OPEN COURT:—

DEAR SIR:—In your issue of January 17, I notice an article on Henry George and the single tax by "Wheelbarrow" which, whatever may have been the motive of the writer, and I suspect that after all he may be a single tax man in disguise, scarcely does justice to either Mr. George or the reform which he represents.

In all that Wheelbarrow says about Mr. George's arguments which are based upon scriptural authority or theistic ideas, I can thoroughly agree with him. To those who dispute his premises such arguments are of course of little value, and if Mr. George rested his case here, his reasoning would be poor indeed. It must needs be a poor cause which cannot find its justification in scripture. But one of the strongest points about the single tax from the standpoint of those who reject faith and rely upon reason, is that a large proportion of the single tax men are those who reject either wholly or in part orthodox ideas on religion.

But to return to our Wheelbarrow. Will he please point out the exact place in *Progress and Poverty* where the millenium is promised "by the simple means of a single tax on land?"

Will Wheelbarrow point out where Mr. George "denounces every progress, under present circumstances, as driving a parting wedge between the rich and the poor." If this is meant to imply that Mr. George opposes all reforms except putting taxation on land values, it simply is not true. Take free trade, for instance, he recognizes the fact that free trade in this country will go to the landlords the same as free trade has increased rent in England. But does he for that reason oppose free trade? Not at all; there is no man in America to-day that has done as much for free trade as Henry George. On reading the first part of Wheelbarrow's article I thought that perhaps he had read *Progress and Poverty*, that is in much the same manner as the average reader who thinks it can be grasped in a few hours like a novel, but when he gravely tells us that Mr. George "loses sight of the fact that land in itself and apart from labor has no value, whatever," it is almost too much. If Wheelbarrow would only take the trouble to read Henry George again he would find that his strongest claim is that the value of land is entirely due to the labor of the whole community, and therefore it is fit and proper that the community and not the alleged owner should get the benefit of it.

A. H. STEPHENSON.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXI.—Continued.

Mr. Hummel retraced his steps to the sitting-room; there also he walked up and down, and told his wife of Mr. Hahn's misfortune in short sentences. He observed, out of the corners of his eyes, that Mrs. Philippine hastened, nervously, to the sofa, and frequently clasped her hands; and that Laura rushed into the next room, and could not refrain from bursting into

tears; and he repeated, with dreadful satisfaction, the terrible words: "He has gone out like a candle."

He behaved in the same way at the factory; he paced slowly up and down the warehouse, looked majestically on a heap of hareskins, took one of the finest hats out of a bandbox, held it towards the window, gave it a stroke with the brush, and muttered again: "It's all up with him." To-day his book-keeper, for the first time in his life, was late at his desk: he had heard of the misfortune on his way; he related it in an excited manner to his principal, and finally maliciously repeated the unfortunate words: "It's all up with him." Hummel gave him a piercing look, and snorted so that the timid heart of the clerk sank within him.

"Do you wish also to become manager of my business like that runaway? I thank you for this proof of your confidence. I have no use for such bandit-like proceedings; I am my own manager, sir, and I object to every kind of secret dealing behind my back."

"But, Mr. Hummel, I have carried on no secret dealings."

"The devil thank you for that," roared out Hummel, in his fiercest bass. "There is no more confidence on earth: nothing is firm; the holiest relations are unscrupulously violated; one can no longer trust one's friends; now even one's enemies make off. At night you lie down to sleep quietly as a German, and in the morning you wake up as a Frenchman; and if you sigh for your German coffee, your hostess brings a dish of Parisian spinach to your bed. I should be glad to learn of you on what spot of this earth we are now settled."

"In Valley Row, Mr. Hummel."

"There the last remains of our good genius spoke out. Look through the window. What stands there?" pointing to the neighboring house.

"Park Street, Mr. Hummel."

"Indeed?" asked Hummel, ironically. "Since primeval times, since your ancestors sat on the trees here nibbling beechmast, this place has been called Valley Row. In this valley I laid the foundations of my house, and enclosed in the wall an inscription for later excavators: 'Henry Hummel, No. 1.' Now the machinations of yonder extinguished straw-man have upset this truth. In spite of my protest in court, we have become transformed into park denizens by a police ordinance. Scarcely has this happened, when that man's book-keeper transforms himself into an American. Do you believe that Knips, junior, this salamander, would have ventured on this misdeed if his own principal had not set him the example? There you have the consequences of everlasting changes and improvements. For twenty years we have gone on together, but I believe now you are cap-

* Translation copyrighted.

able of throwing up your place and entering into another business. Bah, sir! you ought to be ashamed of your century."

* * *

It was a sorrowful day for the Hahn family. The master of the house had gone to his office in the city at the usual hour in the morning, and had awaited his book-keeper in vain. When at last he sent to the young man's dwelling, the porter brought back word that the former had departed, and left a letter on his table for Mr. Hahn. Hahn read the letter, and sank down upon his desk with sudden terror. He had always carried on his business like an honest tradesman. He had begun with small means, and had become a well-to-do man by his own energy; but he had confided his money matters more to his clever clerk than was prudent. The young man had grown up under his eyes, and had gradually, by his pliant, zealous service, won full confidence, and had shortly before been granted the right of signing the name of the firm to financial obligations. The new manager had succumbed to the temptations of these turbulent times and had, unknown to his principal, ventured on rash speculations. In the letter he made open confession. He had stolen a small sum for his flight; but Mr. Hahn would on the following day have to meet his losses to the amount of about twenty thousand thalers. The thunder-bolt fell from a clear heaven into the peaceful life of the merchant. Mr. Hahn sent for his son. The doctor hastened to the police-office, to his solicitor, and to his business friends, and returned again to the office to comfort his father, who sat as if paralyzed before his desk, hopelessly looking into the future.

Dinner-time came, when Mr. Hahn must impart his misfortune to his wife, and there was lamentation within the house. Mrs. Hahn went distractedly through the rooms, and Dorothy wrung her hands and cried. In the afternoon the Doctor again hastened to his acquaintances and to money-lenders; but during this week there was a panic, every one mistrusted the other. Money was scarce, and the Doctor found nothing but sympathy, and complaints of the fearful times. The flight of the book-keeper made even confidential friends suspicious as to the extent of the obligations of the firm. Even by a mortgage on the house, with the greatest sacrifice, no sufficient sum could be obtained. The danger was more threatening every hour, the anguish greater. Towards evening the Doctor returned home to his parents after his last fruitless expedition. To his father he had shown a cheerful countenance, and comforted him bravely; but the thought was incessantly present to his mind, that this misfortune would divide him utterly from his loved one. Now he sat weary and alone in the

dark sitting-room, and looked towards the lighted windows of the neighboring houses.

He well knew that one friend would not fail his father in distress. But the Professor was at a distance, and any help he could give would be insufficient; at the best it would come too late. There were only a few hours before the decisive moment. The intervening time, one of rest for all others, was one of endless torture to his father, in which he contemplated, with staring eyes and feverish pulse, a hundred-fold the bitterness of the ensuing day, and the son was terrified at the effect which the dreadful strain would have on the sensitive nature of his father.

There was a slight rustle in the dark room—a light figure stood beside the Doctor. Laura seized his hand and held it fast within hers. She bent down to him, and looked in his sorrowful countenance. "I have felt the anxiety of these hours. I can no longer bear solitude," she said, gently. "Is there no help?"

"I fear, none."

She stroked his curly hair with her hand.

"You have chosen it as your lot to despise what others so anxiously desire. The light of the sun, which illumines your brow, should never be darkened by earthly cares. Be proud, Fritz; you have never had cause to be more so than at this hour, for such a misfortune cannot rob you of anything that is worth a pang."

"My poor father!" cried Fritz.

"Yet your father is happy," continued Laura, "for he has brought up a son to whom it is scarcely a sacrifice to be deprived of what appears to other men the highest happiness. For whom had your dear parents amassed money but for you? Now you may show them how free and great you rise above these anxieties for perishable metal."

"If I feel the misfortune of this day to my own life," said the Doctor, "it is only for the sake of another."

"If it could comfort you, my friend," exclaimed Laura, with an outburst of feeling, "I will tell you to-day that I hold true to you, whatever may happen."

"Dear Laura!" cried the Doctor.

Her voice sang softly in his ear like a bird:

"I am glad, Fritz, that you care for me."

Fritz laid his cheek tenderly on her hand.

"I will endeavor not to be unworthy of you," continued Laura. "I have long tried in secret all that I, a poor maiden, can do, to free myself from the trivial follies that trouble our life. I have considered fully how one can keep house with very little, and I no longer spend money on useless dress and such rubbish. I am anxious also to earn something. I give lessons, Fritz, and people are satisfied with me. One

requires little to live upon, I have found that out. I have no greater pleasure in my room than the thought of making myself independent. That is what I have wished to express briefly to you to-day. One thing more, Fritz; if I do not see you, I always think of and care about you."

Fritz stretched out his arms towards her, but she withdrew herself from him, nodded to him once more at the door, then flew swiftly across the street back to her attic room.

There she stood in the dark with beating heart; a pale ray of light gleamed through the window and lighted up the shepherd pair on the inkstand, so that they seemed to hover illuminated in the air. This day Laura did not think of her secret diary, she looked towards the window where her loved one sat, and again tears gushed from her eyes; but she composed herself with quick decision, fetched a light and a jug of water from the kitchen, collected her lace collars and cuffs and soaked them in a basin—she could do all this herself too. It was another little saving, it might sometime be of use to Fritz.

Mr. Hummel closed his office and continued to rove about. The door of Laura's room opened, the daughter shrank within herself when she saw her father cross the threshold solemnly, like a messenger of Fate. Hummel moved towards his daughter and looked sharply at her weeping eyes.

"On account of him over the way, I suppose." Laura hid her face in her hands, again her sorrow overpowered her.

"There you have your little bells," he grumbled in a low tone. "There you have your pocket-handkerchiefs and your Indians. It is all over with the people there." He slapped her on the shoulder with his large hand. "Be quiet. We are not responsible for his ruin; your pocket-handkerchiefs prove nothing."

It became dark; Hummel walked up and down the street between the two houses, looking at the hostile dwelling from the park side, where it was less accessible to him, and his broad face assumed a triumphant smile. At last he discovered an acquaintance who was hastening out of it, and followed him.

"What is the state of the case?" he asked, seizing the arm of the other. "Can he save himself?"

His business friend shrugged his shoulders.

"It cannot remain a secret," he said, and explained the situation and danger of the adversary.

"Will he be able to procure money to meet it?"

The other again shrugged his shoulders.

"Hardly to-morrow. Money is not to be had at any price. The man is of course worth more; the business is good, and the house unencumbered."

"The house is not worth twenty thousand," interposed Hummel.

"No matter; in a sound state of the money market he would bear the blow without danger, now I fear the worst."

"I have said it, he has gone out like a candle," muttered Hummel, and abruptly turned his steps towards his house.

In the Doctor's room father and son were sitting over letters and accounts, the light of the lamp shone on the gilded titles of the books against the wall, and the portfolios containing the treasures industriously collected by the Doctor from all corners of the world, and bound up and placed here in grand array—now they were again to be dispersed. The son was endeavoring to inspire his despairing father with courage.

"If the misfortune cannot be prevented which has come upon us like a hurricane, we must bear it like men: you can save your honor. The greatest sorrow that I feel is that I can now be of so little use to you, and that the advice of every man of business is of more value than the help of your own son."

The father laid his head on the table, powerless and stupefied.

The door opened, and from the dark hall a strange form entered the room with heavy steps. The Doctor sprang up and stared at the hard features of a well-known face. Mr. Hahn uttered a shriek and rose hastily from the sofa to leave the room.

"Mr. Hummel!" exclaimed the Doctor, alarmed.

"Of course," replied Hummel; "it is I, who else should it be?" He laid a packet on the table. "Here are twenty thousand thalers in certified City Bonds, and here is a receipt for you both to sign. To-morrow you shall give a mortgage for it upon your house: the papers must be repaid in kind, for I do not mean to lose by it, exchange is too bad now. The mortgage shall run for ten years, in order that you may not think I wish to take your house; you can pay me back when you please, the whole at once, or by degrees. I know your business, no money can now be obtained upon your straw; but in ten years the loss may be recovered. I make only one condition, that no human being shall know of this loan, least of all your wife, and my wife and daughter. For this I have good reasons. Do not look at me as the cat looks at the king," he continued, turning to the Doctor. "Set to work, count the bonds and note their numbers. Make no speeches, I am not a man of sentiment, and figures of rhetoric are no use to me. I think of my security also. The house is scarcely worth twenty thousand thalers, but it satisfies me. If you should wish to carry it off I should see it. You have taken care that it should be near enough to my eyes. Now count, please, and sign the receipt, Doctor," he said, authoritatively, pushing him down on his chair.

(To be continued.)

BOOK REVIEWS.

SCIENTIFIC RELIGION, OR HIGHER POSSIBILITIES OF LIFE AND PRACTICE THROUGH THE OPERATION OF NATURAL FORCES. By *Laurence Oliphant*. Buffalo: 1889. Charles A. Wenborne.

"We realize that our union, instead of separating my husband from the sainted wife whose influence overshadowed him as he wrote the pages of this book, has, in truth, bound him only the more closely, for she has become so *atomically* wedded with me, that we, the wife in the unseen and the wife in the seen, have become as one; her life is poured through me as an instrument doubling my own affectional consciousness," says Mrs. Rosamond Oliphant in the preface to the work of her husband. In the word *atomically* we have the key-note of his "Scientific Religion." The "atom" is the point where the science of modern physicists stops, and where the spiritualism of "Scientific Religion" begins.

"The great problems of life," says the author truly, "are assuming a new form, as the theological landmarks are gradually fading away beneath the flood of light which has been let into them by theological research, antiquarian discovery, scientific investigation, and psychical phenomena; and men in their trouble are peering earnestly into the new region which is being thus illuminated, for a new order which they may substitute for the old—some vital truth-principle which shall conduce to a purer and nobler social life." Ecclesiasticism fails to supply this principle of truth; it is not found in the maxims of conduct that those who follow worldly ways have adopted; we must seek for it in the "process of divine quickening," in the "magnetic attraction which is inherent in the vivifying principle," which draws the incipients of this new life, at first weak and bewildered, "athwart obstacles that would seem insurmountable. * * * The atmosphere feels charged (to them) with mephitic vapor, which sometimes seems even to interfere with the ordinary respiration." The author admits it is "hopeless to attempt to give any complete description of the mode of operation of this new life-principle, for in no two cases are the phenomena which attend its descent into the human organism similar in their manifestations." Granting that this atomism be universal then, and supposing it, as Mr. Oliphant does suppose it, to have a basis, how are we to account for the erratic character of the courses it takes? At best it must be an uncertain and unreliable sort of spirituality. In his attempt at explanation, the author proceeds from the principle of atomicity recognized by modern science. Yet he abandons the methods by which that hypothesis was attained. "This and other points" (the immanence or dualism of force), we read, "can never be settled until we realize that our external senses are not tests upon which we can rely for anything." Good and true. But what of our spiritual senses! What is to tell us whether we can rely on *them*. Modern science has not made the acquisitions from which Mr. Oliphant proceeds, by any acceptance of spiritual revelation. But at this point the aims of physics and "Scientific Religion" separate. "Science to be true must be divine." So reads the Gospel, "Seek ye first the Kingdom of God and His righteousness and all things shall be added to you." How many have sought it! And among the multitude of things added to them, how many of the true acquisitions of scientific progress do we find to be parcel of the grant!

"Though from what has been said," continues Mr. Oliphant, "we may vaguely perceive where these treasures of divine knowledge lie hid, no man can furnish another with a sure key to them. That is to be found by each who would learn the secrets of wisdom, only in his own heart; and it is by an effort of his affections, and not by one of his brain, that he can fit this key to the lock of knowledge. Let him then beware of intellectual effort in this direction, unprepared by the necessary preliminary moral training and discipline to make it."

Moral training and spiritual discipline we need. But in the in-

vestigation of things that *are*, "interior illumination" hardly suffices. "The whole system of civilized life," says Clerk Maxwell, "is fitly symbolized by a foot-rule, a set of weights, and a clock." They symbolize, too, the foundation upon which even the theory of atomism rests. Let us cling, therefore, to the foot-rule, the set of weights, and the clock.

Apart from the scientific untenability of a theory that fashions the atomic constitution of nature to suit every emergency, the work of Mr. Oliphant has many noble features. It is pervaded by a gentleness of sentiment and sincerity of purpose that evokes respect, even where reason commands dissent. We may not agree with "the interlocking of invisible atoms," nor give assent to the hypothesis of "pneumatic and psychic dielectrics," but we recognize the power of self-discipline in its noblest form, and the divinity of the Masculine and Feminine in man, whether they appear as personifications or merely as the expression of mysterious atomic agencies. μικροκ.

NOTES.

The frontispiece of the *Century* for March is a portrait of the Grand Lama of the Trans-Baikal, from a photograph given to George Kennan in exchange for his own. Mr. Kennan's article describes an interesting and amusing episode of his Siberian tour.

Col. T. W. Higginson's poems are about to be published by Longmans Green & Co. of New York and London. The volume is called *The Afternoon Landscape*. The poems include the sonnet "Duty," and lighter stanzas on "A Jar of Rose-Leaves." Among the translations are Sappho's "Ode to Aphrodite," and a dozen sonnets from Petrarch and Carmens.

Ex-Postmaster-General Thomas L. James, in his article on "The Railway Mail Service, in the *March Scribners*, says: "It is due to President Cleveland to state that toward the close of his administration he recognized the importance of permanency in the railway mail service and that he made a long step in advance by approving a series of rules submitted by the civil service commission having for its object the removal of the service from the influences of politicians. It needs more than this, however; it needs the sanctity of the statute law declaring that the clerks should not only keep their offices during good behavior, but that after twenty years of faithful and efficient service, or before that time, if injured in the discharge of their duty, they should retire on half pay. In case of death, from accident while on duty, proper provision should be made for the family of the official. Whenever justice is done by Congress in these particulars the United States will have the best and most efficient railway mail-service in the world."

The latest contribution to the discussion in the *Forum* of the Negro Question is by a Negro writer, Prof. W. S. Scarborough, of Wilberforce University, Ohio. In the March number he reviews with a deal of severity the treatment of the Negro question by the representatives both of the South and of the North. But of the future of his race he takes a very hopeful view. He writes: "That which the South declares it will not have—Negro supremacy—has no part in the Negro's plans for his future, nor is it desired by him. * * * The Negro has made a remarkable advance in intelligence and education. The admitted progress of the race has given birth to leaders, younger and better educated, to replace the ignorant and irresponsible ones. * * * As a member of that race, I believe the Negro is looking over the whole situation as a patriot should view it—with an eye not only to his own prosperous growth, but to that of the American people, of whom he considers himself an inseparable part. With such a view he can but take that step which will lead from present troubles to a fruition of his hopes—to be a man among men and not simply a Negro."

WINDFALLS.

[Revised Edition.]

By RICHARD RANDOLPH,

Author of "Aspects of Humanity."

12mo, pp. 108. Price, 50 cents; by mail, 58 cents.

Also, by the same author,

Sober Thoughts on Staple Themes.

12mo, pp. 166. Price, 65 cents; by mail, 75 cents.

For Sale by

HENRY LONGSTRETH,
740 Sansom Street, Philadelphia.

Notices of the Press, to first edition, 1871.

The author has learned to seek the analogy of all science, and to subordinate it to the idea of religion,—and this fact is no unimportant recommendation.—*Philadelphia Post*.

A series of interesting essays and poems.—*Public Ledger* (Phila.).

A collection of gems of Christian thought....

Great truths advocated with singular conciseness.—*Philadelphia Inquirer*.

The works commend themselves strongly to those who despair of combating materialistic tendencies with mere material weapons.—*North American* (Phila.).

They bear the unmistakable stamp of a profoundly religious and philosophical mind.—*Meth. Home Journal* (Phila.).

Will repay examination, if examined thoughtfully.

Our Society (N. Y.).

Many fine thoughts and valuable suggestions.—*Prot. Churchman* (N. Y.).

Full of very strong meat, which will not tickle the appetite of careless readers.... Those who take up these books with a deliberate purpose to read them understandingly, will find their labor well rewarded.—*Literary World* (Boston).

The author is at once gentle and profound in his musings upon Science, Theology, and Human Life.—*New Englander* (New Haven).

The volume *Windfalls* indicates a severe and analytical habit of thought and insight into phases of character and the tendencies of the times.... (*Sober Thoughts*.) Mr. R. dedicates his thoughts "To Faithful Workers." Nor is the dedication inappropriate, for the themes discoursed upon, whether in verse or prose, are such as will commend themselves to no intellectual sluggard, but rather to him whose mind is on the alert for every ray of truth, and who, having once apprehended the right, is willing to do battle in her behalf.—*Am. Literary Gazette and Publishers' Circular*.

Also, same address, ASPECTS OF HUMANITY, a chapter of correspondence from the book of nature, in support of the doctrine of an inspired life, and a continuous revelation. Price, 50c. and 55c.

"The life of man is a continuous Divine revelation."—Eds., *Christian Union*, "30, vii., 1873.

"UNITY."

With the first of March, 1890, this paper enters upon its eleventh year in an enlarged form, so that it can print each week a sermon representative of its message and mission, and at the same time it hopes by an addition to its present list of fifteen hundred new subscribers to reduce the price to a dollar, *i. e.*, to increase the capacity 25 per cent, and reduce the price 33 1/3 per cent. UNITY is the organ of the National Unity Club Bureau, it has fostered and to a large extent shaped the Postoffice Mission work, it believes in and works for People's Churches and inclusive religion. It is suspicious of sectarian tendencies and dogmatic exclusiveness. It believes that religion should be friendly to science, and that it is indebted to its triumphs. It seeks to make religion a part of and essential to all human helpings. It would make Rationalism reverent and Reverence rational. It is in search of the unities of universal religion that reaches from the Catholic Church to the Ethical Culture Society, that includes the perennial elements in Christendom, Judaism, and all other forms and names that have purified, sweetened, and ennobled life.

SPECIAL OFFER

To Readers of "The Open Court" only.

For \$1.50 we will send "UNITY" beginning with the number current on receipt of order and continuing to March 1, 1890, and will mail one each of the following pamphlets:

Truths for the Times. By Francis E. Abbot.
Natural Religion. By James Vila Blake.
The Present Heaven. By O. B. Frothingham.
The Religion of Jesus. By H. M. Simmons.
On the Vision of Heaven. By F. W. Newman.
Is Romanism Real Christianity? By F. W. Newman and Francis E. Abbot.
The Change of Front of the Universe. By M. J. Savage.

Christian Propagandism. By Francis E. Abbot.
Evolution in its Relations to Evangelical Religion. By B. F. Underwood and others.

Compulsory Education. By Francis E. Abbot.
Concerning Immortality. By Frances Power Cobbs, William M. Salter, Henry M. Simmons, Minot J. Savage, and others.

An Address. By Ralph Waldo Emerson.

"The Week, one of the ablest papers on the continent."—*Descriptive America*.

ENLARGED AND IMPROVED.

"THE WEEK,"

A Canadian Journal of Politics, Literature, Science, and Art.

Published every Friday. \$3.00 per year.
\$1.00 for Four Months.

THE WEEK has entered on its SIXTH year of publication, greatly enlarged and improved in every respect, rendering it still more worthy the cordial support of every one interested in the maintenance of a first class literary journal.

The independence in politics and criticism which has characterized THE WEEK ever since its first issue will be rigidly maintained; and unceasing efforts will be made to improve its literary character and increase its attractiveness as a journal for the cultured home. Many new and able writers are now, or have promised to become, contributors to its columns, and the constant aim of the Publisher will be to make THE WEEK fully equal to the best literary journals in Britain and the United States.

As heretofore, PROF. GOLOWIN SMITH will, from time to time, contribute articles London, Paris, Washington, and Montreal letters from accomplished correspondents will appear at regular intervals. Special Ottawa Letters will appear during the sessions of Parliament.

THE WEEK in its enlarged form will be the same size as "Harper's Weekly," and the largest paper of its class on the continent.

Send for Free Sample Copy.

CHICAGO, ILL.

Review of Recent Work of THE OPEN COURT. PSYCHOLOGY AND BIOLOGY.

- EXPERIMENTAL PSYCHOLOGY IN FRANCE. ALFRED BINET.....No. 74.
- DREAM, SLEEP, AND CONSCIOUSNESS. DR. GEORGE M. GOULD.....Nos. 74 and 75.
- BODY AND MIND; OR THE DATA OF MORAL PSYCHOLOGY. FELIX L. OSWALD, M. D....Nos. 72, 75, 78.

M. BINET's entertaining sketch of the state of Experimental Psychology in France is the only direct and convenient source from which the reader can obtain a comprehensive idea of the contributions the author's country is making to this branch of mental science. The work of psychologists in France is distinguished by its almost exclusive bearing upon the pathological phases of psychological phenomena. The greatest successes of MM. Ribot, Richet, Charcot, and others, have been in treating the *diseases* of the mind.

PHILOSOPHY.

- SENSATION AND MEMORY. EDITOR.....No. 74.
- COGNITION, KNOWLEDGE, AND TRUTH. EDITOR.....No. 76.
- MONISM AS THE FORMAL PRINCIPLE OF COGNITION..No. 78.

In the two first discussions, the conditions and processes by which we start from the bare excitations of the sensory world and attain to knowledge, are unfolded. Sensation is the primal condition of all knowledge; the products of sensation are preserved and transmitted as psychological forms; the psychological law of this retentive power is memory, from which source are evolved the different branches and varied forms of human thought.

The last essay of this series shows that the constitution of the human mind naturally predisposes man for Monism. The unitary conception which the intellect seeks to formulate respecting all things brought within its range, is the inward proof offered to us of the correctness of the monistic philosophy. Monism is thus a subjective principle, informing us how to unify knowledge and make it potent.

- AXIOMS THE BASIS OF MATHEMATICS. DR. EDWARD BROOKS.....No. 76.
- THE OLD AND THE NEW MATHEMATICS. EDITOR.No. 77.
- A FLAW IN THE FOUNDATION OF GEOMETRY. HERMANN GRASSMANN.....No. 77.

In No. 76, Dr. Edward Brooks of Philadelphia, takes exception to an editorial thesis that "mathematics is unfortunately constructed on axioms." To Dr. Brooks no other way of construction is possible. There exist "*first truths* or *axioms* which the mind has power to cognize," which are incapable of proof, and which every system, even though nominally rejecting them, nevertheless tacitly employs. The editorial answer to Dr. Brooks, in No. 77,

is based upon the principles unfolded in the series of disquisitions on "Form and Formal Thought," in Nos. 64, 66, 67, and 69. Axioms so called, *are the result* of reasoning, and not the basis of it; the laws of formal thought determine the correctness and necessity of a proposition; conformity, in every instance, with these laws alone makes a truth universal. The relations of actual, material space have thus universally coincided with the laws of a formal system of third degree, and hence the rigidity and finality of those relations. In the same number, a translation from Hermann Grassmann's "Theory of Extension" is presented; it contains the fundamental points of departure of the new geometry from the old. No English version of this epoch-making work exists. The discussion will greatly interest those who have given their attention to the philosophy of mathematics.

SOCIOLOGY AND ECONOMICS.

- HENRY GEORGE AND LAND TAXATION. WHEELBARROW.....No. 73.
- SYMPTOMS OF SOCIAL DEGENERACY. MONCURE D. CONWAY.....No. 74.
- MAKING BREAD DEAR. WHEELBARROW.....No. 78.

WHEELBARROW opposes Mr. Henry George and the doctrine of Land Taxation with proper regard for the truth contained in the distinguished economist's theories. Objection is mainly taken to the universal curative power that the advocates of Land Taxation claim for their remedy. In man's obedience to moral laws Wheelbarrow finds the only magic wherewith to change the face of society.

Much criticism has been elicited by the bare mention of Mr. George's economical doctrines—indubitable testimony of their popularity and strength. Letters have appeared in No. 79 and others will follow.

"Symptoms of Social Degeneracy," Mr. Moncure D. Conway finds to be not unfrequent even in American civilization. We are prone to emphasize the survivals of barbaric institutions in effete Europe, while overlooking the excrescences of our own body politic. Lynch-Law, literary piracy, corruption in administrative circles, are signs of the decay of an ethical system and the theology that protects it. Worst of all, these evils are not unaccompanied with attempts at palliation.

HISTORICAL AND CRITICAL.

- THE STUDY OF SANSKRIT. H. OLDENBERG....No. 79.
- ASPECTS, CHRISTIAN AND HUMAN. WILLIAM R. THAYER.....No. 79.

The study of Sanskrit, upon which a series of articles commences with No. 79, is a department of historical research comparatively new. Prof. Oldenberg, one of the most eminent Sanskrit scholars of the present day, tells us in popular language the story of the origin, growth, and present state of Sanskrit research. This department of philological and historical inquiry has done more than any other towards the true interpretation of the early history, civilization, and religion of the Aryan peoples. Within less than a century results have been attained, of which former generations would not have presumed to think. The articles have been translated from the German.

Under the title of "Aspects, Christian and Human," Mr. W. R. Thayer maintains in lucid and apposite language that the influences and forces to which the great changes wrought in modern society must be attributed, have not proceeded from sources essentially Christian. These advances are distinctly secular and human in character. "Not the preacher, but the poet; not the politician, but the untrammelled agitator, men whose tongues were free, and whose hearts were fearless, have been the heralds and champions of better things."

NEWS ABOUT THE PLANETS AND THE MOON.

A SURVEY OF THE LATEST ASTRONOMICAL OBSERVATIONS.

PROF. J. V. SCHIAPARELLI, in an essay recently published in *Himmel und Erde*, presents a detailed account of his recent astronomical discoveries, which corroborate facts hitherto known and testify to the wonderful accuracy of the observations of former astronomers. They show that the surface of Mars is not dead, like that of the moon; Mars lives; and the development of its life manifests itself in a complicated system of curious phenomena, which only in part can be compared to those happening upon our earth. Mars possesses an atmosphere like the earth; its poles are covered with white patches which alternately increase and decrease; it exhibits meteorological changes.

The surface of the planet is divisible into two classes of regions; the divisions of the first class are bright in color, the shades varying from orange to deep red; the divisions of the other class are dark, and appear in all tints of gray and black. In calling the former regions continents or islands, and the latter oceans, it is a matter of mere convenience that we adopt the geographical expressions applicable to the earth, for we know nothing of their nature, except what we see.

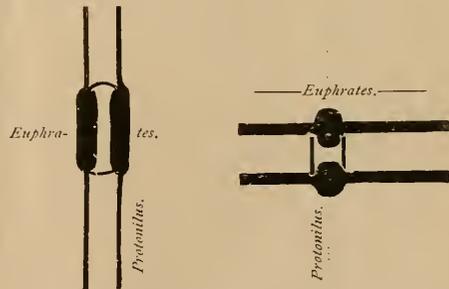

Besides the slow changes that have been observed in the distribution of these colors, white specks have been seen at the periods of opposition; thus, one to which Schiaparelli has given the name of *Nix Atlantica* and which he says equaled the southern Pole in whiteness.

The most wonderful phenomena, however, are the canals. Their name, like all the other topographical designations, was adopted merely for the sake of convenience and not at all because Schiaparelli supposed them to be similar to terrestrial canals. Indeed their size would be too large to admit of such a comparison. They form nets of straight lines with an apparent diameter of from 15 to 20 seconds and even more. Their breadth is not constant. Where two or more canals meet, as a rule, lakes are formed.

The most puzzling phenomenon of these canals is their duplication into parallel bands. The process of duplication does not require more than one or a few days, and it seems that the change takes place simul-

taneously along the whole length of the canal. If a double canal is cut by a single one, its parallel sections are respectively equal in breadth and brightness, as shown in the diagram subjoined. The stages of transformation have not yet been sufficiently observed since a fog always overspreads the canal before the duplication takes place. Schiaparelli considers this appearance that envelops the canal as the characteristic feature of the transformation. It does not, he says, appear to hide the phenomenon, but to evolve it. He compares it to a number of soldiers who disperse without order to arrange themselves again in two columns.

The arrangement of the lakes where two canals cross, and the size of the canals, follow certain laws. The duplications are always equal in breadth and the lakes (as can be seen in the instances of the crossing of Euphrates and Protonilus, observed at different times) also appear double, following the direction of the duplicated canal.

Mars being the best known of the planets, has quite monopolized our interest. But the other members of the solar system are not quite forgotten.

The familiar red spot on the surface of Jupiter has been employed by Herr Lohse, of Potsdam, to calculate once more the rotation of the planet. Mr. Jennings, of Bristol, has recently established analogous results from numerous observations of the spot, and it appears, in consequence, that the rotation time of the planet, as thus obtained, has been different in different years. In 1885-86, from calculations of 659 rotations,

it was found to be 9 hours, 59 minutes, 41.1 seconds; which was an increase of 7 seconds since 1879. At the present time it is, apparently, decreasing again. Are we to infer from this, that Jupiter really rotates on its axis with an inconstant velocity? That would be indeed astounding, since heretofore astronomers have regarded the rotation times of the planets—and especially that of the earth, which is equal to a sidereal day—as the most constant quantities presented to observation. The evident inference is, rather, that the red spot, considered with reference to its vicinage, does not remain at rest, but is slowly displaced, in the course of time,—not always, however, in the same direction, but now in one, and now the other. Future observation, perhaps, will furnish more definite information regarding these movements, and make disclosures as to the real nature of this interesting appearance.

Remarkable light-phenomena, not noticed hitherto, are reported in the vicinity of the second largest planet, the ring-encircled Saturn, by Dom Lamey. As early as 1868 this astronomer, with a four-inch refracting telescope, at Strassburg, noticed beyond this immediate region, somewhere between the paths of the fifth and sixth satellites, Minas and Titan, certain appearances of light, formed like rings; and since 1884, from observations made on the top of Grignon, favored by an unusually clear atmosphere and with a more powerful telescope, Dom Lamey is convinced of having frequently recognized their exact forms. These rings of light are, according to his account, four in number; but are only seldom visible in their full extent. As their brilliancy is strongest at the very point where the satellites are in proximity to each other, the phenomenon is not explainable as the effect of contrast,—it being the case, moreover, that they surpass in brilliance the nearest satellite. This interesting observation, it is true, has as yet not been confirmed from other quarters. Perhaps, after this suggestion, the possessors of larger telescopes will direct their attention more closely to these doubtful objects.

The moon, according to Langley's measurements, does not seem to be so dreadfully cold, as was formerly the opinion of scientists. By reason of its lacking an envelopment answering to our atmosphere, however, it must still be extremely uninhabitable—quite the opposite of our dear neighbor Mars. But why has the moon no atmosphere even approaching ours in density? Grenstedt explains this from the light density of the lunar substance. Both the earth and the moon are like meteoric masses which, when exposed to the air, oxydize; but by reason of the lesser density of the moon oxidation in its interior spread more freely than in the earth, and even before its original fire became extinct, the air and the water of its surface were chemically imprisoned in its rocks.

ASPECTS, CHRISTIAN AND HUMAN.

BY WILLIAM R. THAYER.

II.

I WONDER not that Christianity, as expounded by the dominant creeds, is losing its hold on the hearts of men. I wonder, rather, that any religion which asserts that all mankind were damned by the sin of a single ancestor, Adam, and that all may be redeemed by the single sacrifice of Jesus, should have survived through eighteen centuries. No doctrines more preposterously at variance with experience than these have ever been solemnly promulgated and stubbornly believed by civilized beings. If I told you that one of your forebears in the tenth century was a cut-throat, and that therefore you and all your posterity must be hopelessly sinful, you would laugh at me; just as you would laugh if I should tell you that all the descendants of a saintly person are assured of everlasting bliss. To him who searches his moral nature no conviction is clearer than that his soul's welfare or disease depends upon himself. The example of good or evil men may affect him, but the decision to follow either of them comes from within. Your identity, differing from all that have ever been or ever will be, is inviolable: no man can wrest it from you, nor have you the power to alienate it from yourself. In each of us is set up this holy of holies, whose threshold no stranger may cross: conscience sits in judgment there. You cannot persuade her that your neighbor's sinfulness justifies you in sinning; nor that his virtue atones for your iniquity. By yourself alone can you be degraded or uplifted. Ponder it well—would you wish it otherwise? Would you have your soul in your brother's keeping? Would you be no better than a chameleon, which borrows the hue of the last bush it glides beneath? No stronger than the subject whom the mesmerist compels to absurd antics and involuntary crime? No—a thousand times no! Let us give thanks that the soul is verily self-centred—that each of us can resolve, "Whatever any one does or says, I must be good."

But the burden of the interpreters of Scripture has been from the first, that we are saved or damned by the acts of others. These twisters of texts deprive man of his dignity, and make of him a passive slave, who was sold into perdition by Adam, unless he be ransomed by Christ. Worst of all, the bargain was struck and sealed ages before we, the poor chattels, were born! No grocer, no cobbler, would do business after such a method: yet in this spiritual barter the everlasting weal of human souls is at stake.

Protestantism and Romanism have vied with each other in branding these twin falsehoods into the faith of Christians. I am not discussing whether Christ himself taught this monstrous doctrine or not, but I am examining some of the phases of actual Chris-

tianity; so I do not cite passages from the New Testament, or from the early Fathers, but I limit myself to a few characteristic quotations from modern representatives of Christian sects. Hear, first, what Latimer, one of the venerable shapers of the Anglican Church, bids every believer to reply to the question, "Who art thou?" "I am of myself, and by myself, coming from my natural father and mother, the *child of the ire and indignation of God, the true inheritor of hell, a lump of sin, and working nothing of myself but all towards hell, except I have better help of another than I have of myself.*"* So Luther asserts that "there's no doubt that all created things have degenerated by reason of original sin." This is the theme of *Paradise Lost*, this the moral of *The Pilgrim's Progress*, the poetical and the prose epic of evangelical Protestantism. Bunyan's hero, whose career is intrinsically as selfish as that of any hermit in the Thebaïd, shrinks not from classing "wives, husbands, and children" with "*harlots, lusts, pleasures, honors, precious stones, and what not,*" among the wares vended by Beëlzebub in Vanity Fair: but Christ, he says, "had no mind to the merchandize, and, therefore, left the town without laying out so much as one farthing upon these vanities." Cardinal Newman, who should understand the more enlightened orthodox Romanism of our own time, utters a similar opinion: "*If there is a God, since there is a God, the human race is implicated in some terrible aboriginal calamity. It is out of joint with the purposes of its Creator. This is a fact, a fact as true as the fact of its existence; and thus the doctrine of what is theologically called original sin becomes almost as certain as that the world exists, and as the existence of God.*"†

Verily, logic has invented no other syllogism so diabolical as this: The human race is wicked; God, who created the human race, is good; therefore, the human race is wicked. Can we not hear such a Creator exclaim to his creatures: "I love perfection, and have made thee imperfect. I am all-skillful, all-powerful, and have made thee out of joint. Yet shalt thou worship my perfection, and my justice, and my love, and thou shalt thank me for having made thee liable to eternal damnation, or thou wilt surely be damned." Such is the threat of this bungling mechanician to his important machine. This is the hideous fetish still worshipped as God in many Christian churches: unless it be that the worshippers do not believe in their hearts the creed their lips profess. God a tyrant, religion a terror—that is the meaning of those dogmas which Latimer, and Luther, and Newman, and Andover sectaries disseminate. But, as has been truly said, "I cannot think that there was ever any scared into

heaven: they go the fairest way to heaven that would serve God without a hell."

When you come out, on a Sunday evening, from a church where these atrocious doctrines have been reiterated and upheld, what sense of relief, of peace, of expansion is this, which fills you as you breathe the untainted air, and look up at the mysterious stars? They too are comprehended in the destiny which embraces you; and those fire-flies twinkling in yonder meadows, and the crickets chirping in the grass. Do you see here, or anywhere, a sign that the Omnipotence which kindled a light in those stars and on the wings of those tiny insects, which gave a tune to those crickets and night-birds, is bent on persecuting *you*? What spite has the Everlasting against you? The ears have heard the sermon, but the soul revolts against it. Conscience publishes anew the sanctity of the individual soul, and the gospel of self-reliance and responsibility. Reason refuses to impute to God wrathfulness and malice which the worst men would not practice.

But if you do believe that a ferocious Elohim misgoverns the universe; that he has created every human being with a predisposition for hell, degrading man in this below the beasts, which dread nothing and hope nothing; if you believe that only a few of those who have heard the name of Christ shall be saved, and that millions of millions, born before Christ's time or in heathen countries, are to be damned without a hearing: do not so stultify your conscience and corrupt all terms as to call this monster *good*, God. If Elohim were omnipotent, the true God, and source of all thoughts and creatures,—instead of being the conception of half-barbarous Hebrews three thousand years ago—whence could you have derived these purer ideals of virtue and mercy? Whence could your reverence of justice and love have emanated? Certainly, not from him; but from some spiritual potentate antagonistic to him, as Prometheus was to Zeus; the source from which every unselfish act and wish has flowed. Ah, sad is it that the dove who should carry Christ's olive-branch of peace and love and hope, has been accompanied and overshadowed throughout the ages by the vultures of Elohim and Ahriman, birds of prey and darkness before whose terrifying screams and cruel talons men have cowered and quailed, unheeding the sweet tidings of the messenger of Love!

Ah me! Ah me! how have we recklessly banded from mouth to mouth the names of the deepest mysteries; gossiping, as of familiar household affairs, of infinity, eternity, immortality, and of the everlasting, incomprehensible God! And now the question, *What do we know?* brings us to bay, and strikes us dumb. We, who have never yet established our earthly reg-

* *Sermons on the Cards*, 1529.
† *Apologia pro Vita Sua*, p. 268

imen so that it has endured unchanged for a single year; we, who cannot stretch forth our hand and pluck a single blossom from to-morrow, nay, from an hour beyond the present: we yet presume to fix the state of human souls through all eternity, to allot the sessions and occupations of heaven and the penalties and anguish of hell! We, who cannot soothe the heart of a bereaved sister, or mitigate the despair of a brother—who behold struggling and falling around us multitudes whom we cannot or do not succor—we prattle complacently about those who are to be saved or damned! Let us put away presumption! Let our insignificance teach us humility! Let our bond of human kinship unite us in charity! The mystery of Evil has never been unravelled by the fingers of logic or theology; the Burden of Sin has never been exorcised by Orphic psalm-singing and sermons. He who has looked, in some awful moment, upon the abysses which mortal sight can never fathom, and has realized, however dimly, that they are unfathomable; who has seen, as in a vision, the universal toss and surge, and the boundless possibilities of life; he will not presume, in lower moods, to babble thereof. "If your strength allow, behold," says the Keeper of Mysteries; "but you may reveal no secrets." Awed and humbled, the gazer turns for relief to the world lighted by the sun. The sufferings, the needs, of his fellow-men,—these he can understand. These are actual, insistent, and within reach. Let him consecrate himself to them, and his energy will expand; let him merge his desires in their welfare, and his perplexities will slumber. The spectator of a battle is appalled by a sense of the peril and horror which beset the combatants: but the soldier thinks only of the justice of his cause, of the duty of courage, of the glory of victory.

THE VICARIOUS ATONEMENT.

MR. WILLIAM R. THAYER, while justly criticizing the absurd views of the radical perversity of man and the dogma of vicarious atonement, overlooks, it seems to us, the truth which lies hidden in these doctrines. We really and literally inherit the sins as well as the blessings of our ancestors—of our bodily ancestors as well as of our spiritual ones.

Our bodily ancestors are those whose blood runs in our veins, most of whom (the American nation being chiefly Teutonic) lived, in Tacitus's time, on the banks of the Rhine and Weser. Our spiritual ancestors are those men whose ideas we have accepted, those who contributed to the growth of our present civilization, the Greeks and Romans, the Hebrew* and other nations of antiquity. Now, we are indeed punished

* Mr. Thayer speaks of the half-barbarous Hebrews. We might just as well speak of the semi-civilized Greek. Our Hebrew literature, we must not forget, contains the germs of our ethical ideals of to-day; and the decalogue of Moses is in its way at least as classical as Homer, Plato, and Aristotle together.

for the sins of our predecessors, just as much as we are saved through their ransoming deeds and thoughts.

Individualism looks upon each individual as a separate being who, whatever he be, is supposed to be independent, and to exist of himself, and who, for good or evil, is responsible to no one but to himself. This view is wrong: The individual is what he is through others and mainly through his ancestors; he has to suffer with them, and inherits their blessings. But Mr. Thayer is right in blaming those who literally believe in hell and think that a man can be damned or saved for all eternity without his having consciously or unconsciously accepted the merits or demerits of his ancestors. It takes exertion on our part to acquire the treasures of our spiritual existence:

"Whate'er thy fathers have bequeathed thee;
Earn it anew, to really possess it."

Mankind cannot be considered an aggregate of single individuals; it forms a living whole, and humanity, the intellectual life of mankind, is one unitary growth in which the men of history are only parts, and transient phases, whose efforts and lives cannot be understood unless the development of the entire race be taken into consideration.

P. C.

THE PRINCIPLES OF GOOD AND EVIL IN FICTION.

BY CORA H. PALMER.

"IN the science of sound," says Mr. J. H. Shorthouse,* "there are partial tones which are unheard but which blend with the tones that are heard and make all the difference between the paltry note of the poorest instrument and the supreme note of a violin. So, in the science of life, in the crowded street or market-place, or theatre, or wherever life is, there are partial tones, there are unseen presences. Side by side with the human crowd is a crowd of unseen forms—Principlalities and Powers and Possibilities."

So, too, in literature there are unspoken messages, there are hidden meanings which compliment the written word and flood with the light of every-day experience the by-paths of fanciful thought.

In "The Countess Eve" Mr. J. H. Shorthouse has, with a wealth of imagery and exquisite description, interwoven the problem of Eden and the problem of Faust—the search after happiness and the search after higher life.

To be of value, an allegory must embody fundamental truth. However individual opinions as to the origin and credibility of the Mosaic history may vary, the principles underlying the story of Paradise Lost are co-existent with human life and human fallibility. Temptation and its consequences are not the less cogent because faith and scepticism, science and scholasticism, consider them from widely different standpoints. Whether body and soul be dual or indivisible there are impulses inherent which work for evil as there are tendencies intrinsic which strive for good. Relatively we may consider causes, practically we must deal with results; for although thoroughly to reform a man it may be necessary to begin with his grandfather, to help a man it is only possible to begin with himself. The vital question, therefore, is not so much how or why evil is here, as in what way evil may be overcome, and the author who affords honest help to his fellows, though it be in the sentence or one precept only, has done more for hu-

* The Countess Eve. By J. D. Shorthouse. MacMillan & Co. London and New York. A. C. McClurg & Co., Chicago.

manity than he who fills volumes with abstruse theory and speculation.

The inculcation of personal responsibility, not alone for the deeds done in the body, but for the thoughts engendered in the mind is the only training that will keep the whole life in equipoise; the only training that makes of man an independent, thinking, willing personage, and not a mere puppet dancing on wires of heredity to the measures of circumstance. For surely the doctrine that man "is no more responsible for his character than for the shape of his nose," will never serve to "help the weak-hearted or to raise up those who fall."

Every soul has its *Arbor Vitæ* in that which stands as the exponent of the greatest excellence to which existence is attainable, and whatever would belittle or degrade this individual ideal must encounter the flaming sword that intervenes to guard the tree of life. Moral, like physical electricity, has a duplex and diametric action. No one ever retrograded by following consistently the highest instincts of his nature, yet mistaken opinion may lead to much that in itself is the reverse of excellent; education, therefore, is of doubtful value unless it teach the mind to discern what really are the higher impulses and the true uses of our nature. Perverted god is often more baneful than absolute evil, for not only does it destroy where it ought to quicken, but it reacts against the existence of that *right* reason in which and by which all good is nourished. Every new-made home is a possible Eden, every new-made soul a possible Faust.

Mr. Shorthouse confronts the problems from the orthodox point of view, at the same time recognizing and utilizing all the subtle influences of night, and storm, and darkness; all the charm of music in the spiritual and in the sensual worlds; all the witchery of spring in the air and in the heart; all the grace of forgiveness to beat down the barriers of memory and remorse; all the joy of virtue triumphant over sin. The author pays tribute to the innate strength of purity in woman in his conception of the Countess Eve. It is the genuine womanliness of the heroine, the longing for a wider experience, the eager curiosity to see life; the fresh enjoyment of congenial companionship, and the unconscious innocence that thinketh no evil, which constitutes at once her greatest danger, her greatest safe-guard, and her greatest charm. Steeped in the oblivion of a blind remorse for the transgressions of his youth, her husband's abstraction builds a barrier against which the soul-wings of the wife beat helplessly, until all the human longings of her nature turn from him seeking elsewhere the companionship denied her in her rightful home. The lamp of experience burns in rain if it light not the pit-falls in the path of the present. "There is no entrance into Paradise without love." There is no continuance in paradise without virtue.

A wife's paradise is her husband's heart and love is the tree of life in the midst of her garden, the door of which swings outward—not always, and not often does it swing inward as well. Only to the pure in spirit is the way back into paradise unbarred.

The author draws a sharp line between sins of circumstance and sins of will, but it is in the consequences entailed and in the effect on character that his distinction is made, rather than in the sins themselves.

In the musician de Brie, Mr. Shorthouse has embodied the ideal of a pure soul above and beyond any thought of evil, elevating by his presence everything with which he is brought in contact, while in the actor la Valliere are concentrated material graces of person, mind, and manner, in the 'matchless fascination of an attractive nature'—"plastic as clay in the potter's hand, and yet attractive as though it had absorbed the grace of all natures into its own. * * * He is nothing in himself, he is nothing but a lovely masque."

Here is manifestly the type of man's natural organism, physical and mental perfection independent of moral restraint. "He

is good but the slave of his feelings, a born actor to whom all parts are alike." His theory of life is the materialists' creed.

It is the creed of indulgence that knows nothing of the higher law of self-restraint—carried to its logical consequence, it is the creed that degrades. In the development of the narrative the author shows the deterioration of man as the influence of the spiritual or moral nature is gradually withdrawn, until in carrying out his theory of enjoyment he sinks to the level of the sensualist, and loses at the last even the approbation of the world which lightly applauds and lightly condones so many offenses.

The motif of the story is plainly the attack by certain phases of so-called advanced thought on the institution of marriage through the attack on the sanctity of the marriage bond,—but perhaps the most valuable doctrine inculcated by the allegory is that, independent of heredity and circumstances, the choice of conduct and the development of character lies with the individual, and that temptation if not the result, is, in any case, largely under the control of the individual will.

Mr. Shorthouse skillfully utilizes the effect of music on opposite natures when he makes the strains of the violin, through which de Brie expresses the 'holy joy of a pure love,' bring to the actor temptation, vague and uncertain, but temptation in visible form; nevertheless a persistent effort of will is required to enable la Valliere to see the tempter a second time.

A character like de Brie, to whom 'training had given the grace of an ideal life,' comes like a breath of fresh air into the vitiated atmosphere of our modern fiction heated with passion and befogged by the vapors of unhealthy imagination. The notion common among novelists of a pseudo-educational school, that man must stray through quagmires of dissipation and starve in deserts of cynicism ere he can reach the serene heights where virtue dwells, is as pernicious in theory as it is unavailing in reform. Satiety is not virtue! These same teachers would hardly give a child arsenic to teach it the effect of poisonous drugs, or the rum bottle to educate it against intemperance. Let authors furnish more stepping stones of noble lives and their readers will be in less danger of tumbling into the morass against which they fail would point a warning finger-post.

Few writers of English fiction have depicted more beautiful characters than Mr. Shorthouse, and fewer yet possess that power of description which, with wonderful alchemy, transmutes into exquisite poetry his prose.

FORCE.

BY JOHN B. WOOD.

THE constitution of the material universe as revealed by science, briefly stated is this. Matter lies in two great divisions. One of these embraces ordinary gravitating matter, having three forms or modes of manifestation, as a solid, a liquid, or a gas. The other is the ethereal medium traversed by the waves of light and heat; itself invisible, unweighable, intangible.

All the changes and appearances of the material universe are cases of motion actual or potential obtaining among atoms, particles, masses; or through the medium before mentioned.

Given the matter with motions (conditioned in certain cases upon the kind of atoms or particles concerned) and the complexity of existence and change is logically inevitable. Mere continuity of existence, mere persistence, is rest obtaining in masses, particles, atoms, or in the medium; the latter, if absolute darkness and cold really are anywhere.

Rest itself is stated in terms of motion. It is dependent on conditions such that any one taken singly would determine motion of a definite rate and direction. While all together are equal in value and effect to two conditions of motion of equal rates in the same straight line; but pointing, as it does, towards the opposite portions of limitless space.

When, therefore, any inquiry is started as to the cause of any material fact or change, we are in reality busying ourselves about the cause of some motion or motions.

Now from experiments and observations interpreted by mathematical analysis, any case of motion is found to be conditioned by circumstances belonging to one or both of two possible classes. Those which relate to the state of motion or of rest of the body at the instant logically precedent to the time with which the inquiry has to do, are of one class. The term generally used as descriptive is inertia. The term, though belonging to the older metaphysics which grudged life and action to "dead brute matter," will do. There is no word associated with the phenomenon indicated which is better. Those circumstances which relate to the placing of other bodies, effective at the time upon the body in question, belong to the second class. The word environment, though having a specialized meaning in relation to the Darwinian theory of organic progress, will not be inapt in regard to this class of causes.

Upon inertia and environment then, results depend. The motion of this earth of ours, at any point of its travel at the rate of some eighteen miles a second to complete its journey around the solar orb, depends in the first place upon its rate and direction of flight just before. And, in the second, upon the placing of all the gravitating bodies of the universe; not to speak of such dust, pebbles, and meteorites as strike it and become incorporated with it.

The path of a rifle projectile at any instant depends upon its line and rate of motion logically antecedent, and upon the earth and its atmosphere and whether there is a wind or not. The heat generated when a cannon ball strikes a steel plate is due to the rate, weight, direction, of motion, of the ball, and to the steel plate.

Now, inertia itself was a result. In inquiring then for the ultimate cause of motion, as long as inertia of motion is found it is plain we must push our inquiries backwards in time. That is we are logically referred to the infinite. Broadly speaking the earth moves at this moment because it moved some hundreds of thousands or millions of years ago. And if, as supposed, the solar system is because of the condensation and gravitation towards a focus of the parts of a nebulous fog, for as long as motion of those parts is assumed, must the ultimate cause of this earth's motion on that side of the investigation elude mental analysis. Back of the nebula in motion—what?—more motion of times older still.

And so of rest. This pebble in a sand bank is there surrounded by its neighbor pebbles, boulders, and sand grains—motionless; and has been so for years on years. Gravitation pulls from moment to moment towards the earth-centre four thousand odd miles away. Every bit of matter in fact, in the universe tugs at it and has tugged at it for long sweeps of time. But the resistance to compression of the particles of the underlying beds of sand and rock, the ball of the vast earth; in fact refuses now as in former times to move into any smaller space and so the pebble is there in what we call its place, still, motionless. Now why is it there? We are, as before, referred from instant to instant backward. Tendencies to motion exactly counterbalanced are found from instant to instant backwards in time until in some day of old we come to that time when the waters deposited it and covered it over. Back of that (perchance) floating cakes of ice, or a slow moving glacier had moved the piece of which our pebble is a worn down remnant. In a still earlier day, grain by grain of it had been slowly dropped, to be built in solidly together, under the waters of the sea. And so on and on the mind flies. And back of all are the same fire mists and moving portions of the condensing gravitating nebula of the solar system.

On this side then cause escapes us. Now the environment. Not as to existence but as to influence. Can we do any better?

Why is it that attraction and repulsion take place between bodies, particles, or atoms? Why does the earth instead of flying on through space in a straight line bend away to arch its line of

travel around the sun? Why does a rubber ball flung against the ground recover its shape and by an outward thrust of its elastic particles leap backwards in the air? Why does one cubic inch of water transformed to steam, need seventeen hundred inches of elbow-room; and why will the particles fly asunder to push a piston or sound a whistle in the burry of their enlargement and escape? Why such motions or tendencies to motion?

The answer usually given is this. This or that force is the cause. The force of gravitation sways the earth inwards towards the solar ball. The force of elasticity allows the particles of rubber to push violently outwards. The force of heat sets the water particles in rapid motion (relative to the mean places which they occupy in the mass) so that the effect is that of a highly elastic body.

In all cases it is assumed that force is a something which really exists; and that the existence of the force is necessary to explain and does in fact explain the phenomena.

Now that uneasy skepticism which will not admit propositions as truths without evidence asks, if you please, a little disturbing question—"What fact testifies in favor of force as an existence?"

We see the facts of the placings of bodies, particles, or atoms. We see the facts of the motions or tendencies to motion towards or away from each other. And that is all that experience makes of it. In its most general expression, experience says "it moves." To say additionally "the force caused the motion" is only a repetition in other language of the bare statement "it moves." For if any thing more is in the second proposition than that the facts were so, what can the anything more really be? What is the force and where? Take gravitation. Is the force in the moving body, in the other bodies or in both; is it in space between bodies? Does it extend in a line, as for example, now at this moment, from the solar centre to the place unknown, where some unseen unknown comet flies; destined to appear to astonished millions on the earth in some tens or hundreds of thousands of years from now? Does it pervade space without filling it? an ocean of influence through which any cosmic haze may make its way at the rate of some miles a second without breach of continuity either of force or comet, an example of joint tenancy (as lawyers would say) of space. And how is its pull conceivable? Grant its existence and can the force of gravitation pull matter, or some other force push it, any better than matter can pull or push other matter across an interspace? Do we not want a cause for the cause, a why for the why, a stone under the tortoise which carries the elephant which carries the world? Is our force, in other words, any more than so much more matter wearing a disguise and imposing himself on credulous people as being an aristocrat of mysterious origin and superior nature to the commonplace individual which fills space and moves in it, known to us all and seen every day, a plain, vulgar matter of fact sort of a being?

It is perhaps here said by somebody that there are many things which we do not understand, which, nevertheless, not only may but must be believed and accepted. Most true. But this appeal to ignorance should have come in at an earlier stage of the inquiry. A fact must be believed in whether we can place it logically or not, whether we can know what its relations to other things are, whether we can understand its whys and wherefores or not. Force is brought in because we cannot understand why matter acts on matter through an interspace; why not stop just there, why not believe in the fact of action across space. Why go into architectural construction on a basis of a hypothetical force which needs the faith denied to the certain fact?

Force, then, does not exist in fact. Its only existence is ideal, symbolic. The word has a real meaning. One of the highest importance and value. Force exists as a thought not as a thing.

Let us explain. Instead of stating all the conditions of any actual fact in concrete terms, we say that it was due to a certain

force or forces. Take the case of a stone falling to the earth from rest. Instead of particulars about the amount of matter in the stone and the earth, the distance of each from the common center of gravity, the times and rates of motion towards that center under the circumstances, instead of that sort of statement we use the general expression "force of gravitation" to describe the happening. By this we really imply not only that the particular fact depended upon natural laws and relationship, that it was a part of the order of nature; but that it was one case of a class. That it was one of a possible infinity of facts all subjected to natural law and conditioned by existence and events. We in effect say that the mathematical expression of the values of space, time, matter, and motion, involved in the particular case, in its most general form is good for the infinity of space, time, matter, and motion. So far, that is, as we are entitled to make any assertions concerning the infinite.

Force is thus the name of the generalized cause of any event, just as motion is the name of any event. A little analysis will disclose why it has been supposed to be the name of some thing, existent. In all cases of motion there must be a condition of motion. But no one concrete condition is such in any other case of motion than its own. Motion in the abstract seems to require a condition, a unity of cause, in the abstract. Give a general name and, though only ideal, it seems to denote an existence really correspondent in fact. It is forgotten that there is no such entity as motion in the abstract. Motion must always be the motion of some thing, in some definite direction, of a definite rate, of a definite kind. The question is not then about motion at large, but motions. The inquiry as to the cause of motion is in reality a search for the peculiarity in respect of which all conditions of motions resemble each other.

The mistake made is as if an algebraist having shown that $(a+b)(a-b) = a^2 - b^2$, should go on after this fashion. "Now this is true of any two numbers whatever. But as 6 and 4 cannot represent any numbers but 6 and 4 (and so of any pair of numbers), there must be some real entities immanent in numbers, but not being numbers, of which it is true that the product of their sum and difference is equal to the difference of their squares." Or as if one were to say: "This, that, and the other bodies all agree in this one quality or condition, to wit: the filling of space; but, as no one body occupies the very space occupied by another body, therefore there must be an abstract existence or reality, Body; which entity is that by virtue of which each individual concrete body fills its own individual space."

Besides the confusion of thought created by a general name there is another potent factor. Force is especially translatable into an outside existence, because man projects outside of himself his own feelings and pictures external nature as to some extent resembling himself. In this way the feeling of effort, antecedent to observed motion derived from the agency of man and animals gave rise to the notion of a power possessed by conscious natural agents, antecedent to motion, when animal conscious effort was out of the question. And when the ideas of conscious natural agents exerting power faded away, the names given to them kept alive the belief in a resident something distinct from nature which determined all material activities.

Force is no more a cause in the mental than in the material world. Whether we deal with sensation and perception as the later terms of a series which begins with material existences and activities and proceeds from the objective and outward to the subjective and inward; or travel from the formed purpose to the muscular antecedents to material motion, from mind to matter; or deal with the correlations of mental facts—in any and all cases we cannot put our finger on force as a thing, a cause. We are only ascertaining similarities of the conditions of phenomena and giving names to those similarities.

Metaphysicians who spell all the high abstractions with capital letters and treat them more or less as real beings, will not have it said that we are conscious of matter exerting a force upon mind. But the turn of expression is fully as justifiable as the converse assertion that mind is conscious of force exerted upon matter. And so of volition, such metaphysicians hold it to be unforced. To save free-will the "I, the self, or soul, willed without cause." It is forgotten that the "I" is itself an effect; itself a phenomenon acting and being manifested according to certain conditions, laws, formulas, descriptive of the modes of activity. If the logic which makes of Force or Cause a reality is good for anything, there must be an abstract soul-force separate and outstanding from the concrete individuality; which high abstraction is the true force necessitating all mental states and absolutely dominating the much-to-be-saved Free-Will, which soul-force is itself forced or caused.

FORCE AND CAUSATION.

EDITORIAL COMMENT UPON MR. JOHN B. WOOD'S ESSAY.

Mr. John B. Wood's essay on Force, treats a subject which is intimately connected with the problem of causation as it has been explained in the editorials of THE OPEN COURT, Nos 55, 58, 59, and 60. The whole trend of Mr. Wood's argumentation is the same as that presented by THE OPEN COURT. The term "Cause" must be restricted to "motions which produce changes." Causes are always single facts, real events, that happen in a certain place and at a certain time. From the term "cause" the "reasons why" causes take effect, why certain motions produce certain changes must be carefully excluded. The reasons, or grounds, or *raisons d'être*, are not single facts or events but abstract conceptions. Many phenomena of the same kind are generalized and formulated as a natural law. All natural laws are abstractions. Gravitation is a natural law in which all cases of gravity are formulated. Gravity (the force which is treated in gravitation) is an abstract also; it does not exist as a thing of itself behind the phenomena of gravitation. It has been abstracted by a mental process from all phenomena of gravitation, and the idea of gravity serves the very useful purpose of facilitating our comprehension.*

It is an enormous economy of thought that we are enabled to think all gravitating phenomena by one concept; and to view all phenomena of one kind from one point is the nature of the process of comprehension.

There are philosophers who imagine that the *raisons d'être* (which they call and confound with causes) are realities, and these realities are supposed to be the real agents behind phenomena. Such philosophers speak of "the cause of gravity," meaning thereby the *raison d'être*, the more general law which will comprise the generalization "gravity" as one special kind and thus will explain it. This *raison d'être* of gravity, just as much as gravitation and gravity, is an abstract and does not exist of itself except in our mind where it is employed in economizing thought.

All forces have been abstracted from natural phenomena for the purpose of explaining natural phenomena, for the purpose of classing all phenomena of one kind together and determining their relations, their similarities to, and differences from other groups of phenomena. Now such philosophers as are not able to discriminate between causes and *raisons d'être* imagine that the forces are the real things to be explained. If we could but explain these forces, they imagine we would be in possession of the key to all problems of nature. Forces, however, being mere abstracts must appear to them like phantoms that elude all our means of grasping them and escape us like the shadows of ghosts. Hence the dogma of the ultimate Unknowability of natural phenomena which is believed in so confidently by all who do not clearly see that forces are

* The phenomena of nature affecting one or several of our senses, are mirrored in our brain as images.

mere abstracts, that natural laws are mere formulas comprising many cases of the same kind and abstracted from these single causes—and that neither forces nor natural laws are causes.

Mr. Wood's term "inertia" corresponds in one phase to "cause," and his expression "environment" to "circumstances" in the editorial of *THE OPEN COURT*, No. 55. Both causes as well as circumstances have to be taken into consideration in comprehending the process of causation.

We agree with Mr. Wood that a "soul-force," no more than any other force, can be conceived as a reality of itself. But we do not believe that this idea has been invented merely to save the theory of free-will. Free-will is often wrongly conceived as an unaccountable fact in the world of natural phenomena as by its very nature it is supposed *not* to be subject to law. The 'necessary determination of a free will' is confounded with 'the forced result of a will that acts under compulsion.' Both (though so different), being identified, free will is either rejected as a nonsense and impossibility, or it is claimed to be an exception in the general order of nature. Free will and the responsibility of man for his actions in case he is not under any compulsion do not at all stand in contradiction to the conception of Determinism which holds that all natural phenomena (and man's volition not excepted) are subject to and can be explained by law. P. C.

WASTED LOVE.

BY LOUIS BELROSE, JR.

How many hearts, since first with upturned eyes
Our fathers sought the silent waste and kneeled,
Have burnt their offering in flames revealed
To no man's sight, beneath unconscious skies!

Lost in the void, innumerable, they rise
And err amid the dark of space, congealed
With fumes from altar, stake, and battle-field
That reeked with blood of human sacrifice.

O heart, our earth is cold for waste of love.
Without thy warmth there is no fire can heat
The poor man's hearth—what need the gods above?—

Without thy warmth no raging blast is meet
To fine our gold and cure the curse thereof;
Without thy flame no torch for wandering feet.

DAISIES.

BY ELISSA M. MOORE.

"Wee, modest, crimson-tipped flower
Thou'st met me in an evil hour."—*BURNS*.

DEAR little flower with golden heart
The poet still must take your part;
For you the "Inspired Ploughman" sang,
And through the world your praises rang.

"Wee, modest, crimson-tipped flower,"
It surely was no evil hour
In which his plough-share did you wrong
And brought a burst of wondrous song.

A peasant-poet—mother earth
Held you both fast from hour of birth—
He could not see you die unmoved,
You formed a part of all he loved.

The fair, wee, flower, the fair, wee wife;
The simple loves of simple life
That live through time, and will not pass
While red-tipped daisies deck the grass.

CORRESPONDENCE.

THREE STATEMENTS!

To the Editor of *THE OPEN COURT*:—

In Jan. 31st issue, pages 1442-44 inclusive is an article that ought to be read by every intelligent husband and wife—man and woman—on the face of this globe. It so accurately and vividly describes results that are awful to contemplate, that an intelligent contemplation, and synthetical and analytical comparison of elements should move multitudes to an honest and earnest search for the real causes which create such inevitable—with the view to a radical, absolute, certain remedy.

I here aver that there are but three (3) potential causes, aside from the innate, God-made, organizations of man—*viz.*:

1. A wicked financial system.
2. An inequitable taxation system.
5. Unwise, unpatriotic, vicious tariff system.

I also allege, that if the intelligence, integrity, and inherent patriotism of man for the truth, justice, and equity, should solve these three (3) propositions in the true interest of man in majorities, within the domain of our United States government, by constitutional methods; you, and all others would be relieved from talking, writing, and publishing any future polemic in the field of possible ethics, save as to the actual transgression by the first pair; the true and only purpose of Christ's advent; and the grand possibilities in reach for man, here—in Paradise—in all eternity.

I am prepared to prove beyond the possibility of successful argument, controversy, and doubt, that my hereinbefore statements are absolutely correct, as also there are but three (3) conditions standing in the way of a very near realization of the blessed possibilities coiled up in said propositions for man's good—*viz.*:

1. Ignorance.—2. Prejudice.—3. Interests.

"The way is so plain—"

INDEPENDENCE, IA.

L. H. WELLER.

WHEELBARROW AND LAND VALUES.

To the Editor of *THE OPEN COURT*:—

*** WHEELBARROW seems to be unable to distinguish between land and land-values, but there is no difficulty in it if he will do a little solid thinking. Let him first find out what value is, and then not confound it with anything else. May be we can help him a little. Suppose we say that value is what people will give for a thing. Now land may be very useful and yet worth nothing. No matter *how* useful it may be no one will give anything for it if they can get just as good without buying it. If watches like Wheelbarrow's were free, then watches of that grade would be worth nothing, although they might be very useful time-keepers. When particular land, for any reason, is wanted by more than one person, then a value attaches, and that value is just what any one of them will give for its exclusive use. It is the competition which makes the value at all, and the greater the competition the greater the value, and it is this value which is proposed to be taken under the single tax. Recognizing the equal right of every man, not only to land at all, but to any particular land, then if two or more want the same land the only way to satisfy the rights of all of them and determine which shall have it, is to turn it over to the one who will pay the most into a common fund for them all, and in which they all share alike. If it was proposed to tax land, as such, then all land would be taxed; but it is only valuable land which we seek to tax, and just in proportion to its value. Now can Wheelbarrow understand how that land is something "that attaches to land by the growth of the community?" Growth of the community, increase in population, and increase in competition are synonymous terms, and are only different ways of stating the cause of land values. ***

RAVENSWOOD, ILL.

W. H. VAN ORNUM.

THE SINGLE-TAX.

To the Editor of THE OPEN COURT:—

It is questionable whether any class of reformers is subjected to so much ill-digested criticism as the advanced political economist. * * * Magazine and newspaper readers are being daily entertained by critics who each in his own way "exposes the fallacies" of Henry George. Not the least amusing phase of the onslaught is that these fault-finders seem perfectly oblivious of the fact that in their zeal to forever squelch Henry George, they run counter to established laws, established because in conformity to and based upon, natural laws. * * *

In THE OPEN COURT of January 17th is an article by "Wheelbarrow," who makes bold to say at the outset that he has not only read but *devoured* "Progress and Poverty." Granted that "Wheelbarrow" has inherited the average intellect and really believes that he understands the subject, there is no escaping the inference that the proclaiming of the truth is a hopeless task indeed. He has certainly set up and has probably demolished his man of straw, but he has not seen the central truth of the book he discusses. For instance he makes the statement that while the justice and practicability of Mr. George's land-tax plan is evident, he parts company from him almost from the beginning because of fundamental errors. That is to say: Mr. George's doctrine is fundamentally wrong, but the land-tax scheme is all right. How any plan can be just and still be fundamentally wrong, must be left to others to determine at their leisure. The main purpose of this letter shall be to state succinctly what "Progress and Poverty" does teach.

The basic truth upon which the philosophy of Henry George rests is that the natural resources—the raw material storehouse—belong to the whole people, not to a few. If this truth can be computed, then, not only the "single-tax" plan must fall unsupported, but the Declaration of Independence must take its place among meaningless homilies. It were mockery to declare to men the "right to life" unless it include the right to the *means* of life. And there cannot be an equal right to the means of life, where land, the source of all wealth, is made the absolute property of individuals. The "single-tax" technicality is but a part of the means by which this right can be asserted. The "single-tax," ideally will, it is believed, secure that right as completely as human enactment can. * * * The value of natural opportunities being denoted by the law of rent, the justice of taking this fund for public purposes cannot be questioned. Society by such an act takes but its own. It does more (so far as conforming to natural law and enforcing justice is concerned), for while taking its own and that alone, it will leave to every individual the full and well earned result of his toil, whether by brain or hand. There is still another result from this simple act of justice, besides a more equitable distribution. It is that the aggregate of *production would be immeasurably increased*. In fact it would only be limited by human desire or the exhaustibility of nature, each of which it is held, is infinite. The ability of man aided by machinery to extract from nature as much or more than he can desire, is not in dispute. It is only because our taxing laws have artificially checked production, the same iniquitous condition diverting the bulk of the product into the coffers of the few instead of the many, that involuntary poverty exists in our advanced civilization.

The "single-tax" men believe that the Declaration of Independence if taken from the archives of forgotten lore, honestly interpreted and lived up to by the people of these United States or any other country, is an all-sufficient remedy for current industrial and social ills. There is a power in that old document, which if let loose would surprise and satisfy the most radical of those who long for better days.

JAMES MALCOLM.

HENRY GEORGE'S MISSION.

To the Editor of THE OPEN COURT:—

WHEELBARROW'S position concerning land-taxation, I believe to be sober and just. He agrees with Henry George on the main point, *viz.*, the justice and practicability of land-taxation. The *a priori* argument that land is God's gift, given to all men alike, is futile. I do not see why on this basis the Americans should not send rent, or taxes, or whatever you call it, to the Greenlanders because the American soil is richer than that of Greenland. The only argument in favor of land-taxation can be found in experience "by a fair trial."

It is perhaps natural that a man like Henry George, convinced of the importance of land-taxation, exaggerates the effects of his proposed remedy. He is an enthusiast, and he makes a religion of his cause, but his cause is a good one; and when the exaggerations are so recognized as to be no longer misleading, some good will come from it.

One of the main causes of poverty, it seems to me, is the difficulty for men of a special talent to find their proper places. This difficulty will increase the more our industry becomes specialized and it would remain at least the same under the conditions proposed by Henry George. Would the inventors, the authors, the artists, the musicians be really helped if a last resource were open to them all in farming, of which they most likely understand but little? I know of an author of some prominence who emigrated from the British Islands to our country. Twice a farm was procured for him with the pecuniary assistance of friends, and he failed twice most decidedly.

The weakest part of Henry George's land scheme, it seems, is that he so little appreciates the rights of the present land-owners. Think of a farmer-tenant who buys his farm, paying for it with the sweat of his brow, would he not be entitled to a compensation if the George scheme were realized? There have been changes in the social constitution of mankind by which whole classes of society, or single individuals had to suffer, and whenever it was possible the state arranged to pay them off or to sell them out. Why should it not be done in this case. There is nothing which so much prevents the acceptance of Henry George's view as does his unfair method of indiscriminately classing land owners among pirates, robbers, and parasites. In this he is out-Georged by his followers, especially by the Rev. Doctor McGlynn. Historical rights need not be maintained, they can be changed by legislation, but they have to be considered, and every abolition of antiquated rights is to be done with fairness.

Moreover Wheelbarrow is right that sudden changes are dangerous. If our custom-houses were torn down to-day, if free trade were suddenly established and a single tax levied on land, this would bring about a general bankruptcy and an unprecedented panic. Think only of the failures of those saving banks which possess large stocks in mortgages on land! And that would be a mere trifle in a universal deluge. The sharks would have an excellent time!

I had once the pleasure of meeting Mr. George personally and pointed out to him these difficulties to his land scheme. He kindly admitted all—perhaps from mere politeness—"It is all true," he said; "but," he added, "any one who takes the lead in a movement must push it to its extreme and demand not the half but the whole; he must leave compromises to others."

Very well! The leader of a party, the general of an army must act in this way. Mr. George is not a scientist, not an unbiassed economist, although he has proved that he has the capacity of being one—he is the creator and head of a party, as such he must be judged and as such he has a great mission.

OBSERVER.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXI.—Continued.

"Mr. Hummel," began Hahn, somewhat indistinctly, for it was difficult for him to speak in his emotion, "I shall never forget this hour to the end of my life." He wished to go up to him and give him his hand, but the tears streamed from his eyes and he was obliged to cover his face with his pocket-handkerchief.

"Be seated," said Hummel, pushing him down on the sofa; "steadiness and stoicism are always the main thing; they are better than Chinese toys. I shall say nothing further to-day, and you must say nothing to me of this occurrence. To-morrow everything will be made smooth before the notary and the registrar, and interest must be punctually paid, quarterly; for the rest, our relation to each other remains the same. For, you see, we are not merely men, we are also business people. As a man, I well know what are your good points, even when you complain of me. But our houses and our business do not agree. We have been opponents twenty years, felt against straw, with our hobbies and our trellis-work fences. That may remain so; what is not harmonious need not harmonize. When you call me bristles and felt, I will be coarse to you, and I will consider you as a straw blockhead as often as I am angry with you. But with all that, we may have, as now, private business together; and if ever, which I hope will never happen, robbers should plunder me, you will do for me as much as you can. This I know and have always known, and therefore I am come to you to-day."

Hahn gave him a look of warm gratitude, and again raised his pocket-handkerchief.

Hummel laid his hand heavily upon his head, as with a little child and said, gently, "You are a visionary, Hahn. The doctor is ready now; sign, and do not either of you take this misfortune too much to heart. There," he continued, strewing sand over the paper carefully, "to-morrow, about nine o'clock, I will send my solicitor to your office. Stay where you are; the staircase is badly lighted, but I shall find my way. Good night."

He entered the street, and looked contemptuously at the hostile walls. "No mortgage?" he muttered. "H. Hummel, first and last, twenty thousand." At home he vouchsafed some comforting words to his ladies. "I have heard that the people there will be able to pull through, so I forbid further lamenting. If ever, in conformity with miserable fashion, you should need a straw hat, you may take your money rather to the Hahns than to others; I give my permission."

Some days after Fritz Hahn entered the small office of Mr. Hummel. The latter motioned to his book-keeper to withdraw, and began, coolly, from his arm chair, "What do you bring me, Doctor?"

"My father feels it a duty to meet the great confidence that you have shown him, by giving you an insight into the state of his business, and begs you to assist him in his arrangements. He is of opinion, that until this disastrous affair has passed over, he should do nothing important without your assent."

Hummel laughed. "What! I am to give advice, and that too, in the management of your business? You would put me in a position that is preposterous, and one against which I protest."

The Doctor silently placed before him a statement of assets and liabilities.

"You are a sharp customer," cried Hummel, "but for an old fox this trap is not cunningly enough laid." With that he looked at the credit and debit, and took a pencil in his hand. "Here I find among the assets five hundred thalers for books that are to be sold. I did not know that your father had this hobby also."

"They are my books, Mr. Hummel. I have of late years spent more money upon these than was absolutely necessary for my work. I am determined to sell what I can do without; a book-dealer has already offered to pay this sum in two instalments."

"The sheriff is never allowed to levy on instruments of trade," said Hummel, making a stroke through that entry in the ledger. "I believe, indeed, that they are unreadable stuff, but the world has many dark corners; and as you have a fancy to be an anomalous dick among your fellows, you shall remain in your hole." He regarded the Doctor with an ironical twinkle in his eye. "Have you nothing further to say? I do not mean with reference to your father's business, I have nothing further to do with that, but upon another subject, which you yourself seem to carry on; from your movements of late you evidently wish to associate yourself with my daughter Laura?"

The Doctor colored. "I should have chosen another day for the declaration which you now demand of me. But it is my anxious wish to come to an understanding with you concerning it. I have long entertained a secret hope that time would lessen your aversion to me."

"Time?" interrupted Hummel; "that's absurd."

"Now by the noble assistance which you have extended to my father, I am placed in a position towards you which is so painful to me that I must beg of you not to refuse me your sympathy. With strenuous exertion and fortunate circumstances it would now be years before I could acquire a position to maintain a wife."

"Starving trade," interposed Mr. Hummel, in a grumbling tone.

"I love your daughter and I cannot sacrifice this feeling. But I have lost the prospect of offering her a future which could in some measure answer to what she is entitled to expect; and the helping hand which you have extended to my father makes me so dependent on you that I must avoid what would excite your displeasure. Therefore I see a desolate future before me."

"Exactly as I prophesied," replied Mr. Hummel, "wretched and weak."

The Doctor drew back, but at the same time he laid his hand on his neighbor's arm. "This manner of language will serve you no longer, Mr. Hummel," said he smiling.

"Noble, but abject," repeated Hummel with satisfaction. "You should be ashamed, sir; do you pretend to be a lover? You wish to know how to please my daughter Laura, such an evasive, forlorn specimen as you? Will you regulate your feelings according to my mortgage? If you are in love, I expect that you should conduct yourself like a rampant lion, jealous and fierce. Bah, sir! you are a beautiful Adonis to me, or whatever else that fellow Nicodemus was called."

"Mr. Hummel, I ask for your daughter's hand," cried the Doctor.

"I refuse it you," cried Hummel. "You mistake my words. I do not think of throwing my daughter into this bargain also. But you must not misunderstand my refusal to give you my daughter; your duty is to pursue her more fiercely than ever. You must attack me, and force yourself into my house; in return for which I reserve to myself the right to show you the way out. But I have always said it, you are wanting in courage."

"Mr. Hummel," replied the Doctor, with dignity, "allow me to remark that you should no longer be on the offensive with me."

"Why not?" asked Hummel.

The Doctor pointed to the papers.

"What has happened in this matter makes it difficult for me to use strong language to you. It can be no pleasure to you to attack one who cannot defend himself."

"These pretensions are really ridiculous," replied Hummel. "Because I have given you my money must I cease to treat you as you deserve? Because you, perhaps, are not disinclined to marry my daughter, am I to stroke you with a velvet brush? Did one ever hear such nonsense?"

"You mistake," continued the Doctor, civilly, "if you think that I am not in a position to answer what you say. I therefore do myself the honor of remark-

ing to you that your mockery is so wounding that even the kindness you have shown loses its value."

"Have done with your kindness—it was only kindness from revenge."

"Then I will as honestly tell you," continued the Doctor, "that it was a very bitter hour to me when you entered our house. I knew how oppressive the obligation which you then conferred upon us would be for the rest of my life. But I looked at my poor father, and the thought of his misery closed my mouth. For my own part, I would rather have begged my bread than taken your money."

"Go on," cried Hummel.

"What you have done for my father does not give you a right to ill-treat me. This conversation strengthens me in the conviction that I have had from the outset, that we must exert ourselves to the utmost to repay you the money we have received, as soon as possible. You have crossed out the item in which I credited my books, but I shall sell them."

"Nonsense!" exclaimed Hummel.

"I shall do it, however insignificant the sum may be in comparison with our debt, because the tyranny which you wish to exercise over me threatens to become insupportable. I at least will not be indebted to you in this way."

"Yet you wish it in another way that suits you better."

"Yes," replied the Doctor. "As you have so contemptuously rejected the greatest sacrifice I could make, I shall continue to woo your daughter, even against your will. I shall endeavor to speak to her whenever I can, and to make myself as acceptable to her as is possible in my position. You yourself have shown me this way. You will therefore be satisfied if I enter upon it, and if you are not, I shall pay no regard to your displeasure."

"At last," cried Hummel, "it all comes to light. I see now that you have some fire in you; therefore we will talk quietly over this business. You are not the husband whom I could have wished for my daughter. I have kept you away from my house, but it has been of no use, for a cursed sentiment has arisen between you; I therefore intend now to carry on the affair differently. I shall not object to you coming to my house sometimes. I depend upon your doing it with discretion. I will ignore your presence, and my daughter shall have an opportunity of seeing how you compare with the four walls. We will both await the result."

"I do not agree to this proposal," replied the Doctor. "I do not expect that you should give me your daughter's hand now, and I only accept the entrance into your family on condition that you yourself will treat me as becomes a guest in your house, and that you will perform the duties of a friendly host, I can-

not suffer that you should speak to me in the way you have done in our conversation to-day. Any insult, either by words or by neglect, I will not bear from you. I am not only desirous to please your daughter, but also to be agreeable to yourself. For that I demand opportunity. If you do not agree to this condition, I prefer not to come at all."

"Humboldt, do not undertake too much at once," replied Mr. Hummel, shaking his head, "for you see I esteem you, but I really do not like you. Therefore I will consider how far I can make myself pleasant to you; I assure you it will be hard work. Meanwhile, take these papers with you. Your father has bought the lesson, that he should himself look after of his own money affairs. For the rest, matters are not in a bad state, and he will be able to help himself out of it; you do not need either me or another. Good morning, Doctor."

The doctor took the papers under his arm.

"I beg you to shake hands, Mr. Hummel."

"Not so hastily," replied Hummel.

"I am sorry for it," said the Doctor, smiling, "but I cannot be denied to-day."

"Only from innate politeness," rejoined Hummel, "not from good will."

He held out his large hand to him.

"Keep your books," he cried out, to the departing visitor. "I can see through that scheme, you will buy them again, and then I shall have to pay for them anyhow."

CHAPTER XXXII.

A CHAPTER FROM TACITUS.

TOBIAS BACHHUBER! when your sponsors concluded that you should be called Tobias they did bad service to you and your descendants. For he who bears that name is by fate subjected to experiences that do not fall to the lot of more favorably named men. Who ever passed so miserable a honey-moon as Tobias the younger, the poor son of the blind man? For was he not obliged to fast, and to struggle with a murderous spirit just at a time when a spiritual struggle would be highly disagreeable to any mortal? Even you, blessed Bachhuber, have bitterly experienced the misfortune of your name. Whether the fatal war with Sweden may have arisen because the Swedes hankered after your manuscript, will not be discussed here; it is to be hoped that new historical investigations may yet bring this secret motive of action to light. But it cannot be denied that you yourself suffered lamentably in the war, and the curse of your name still clings to the treasure which you concealed. All who have anything to do with it have their eyes blinded, and an evil spirit destroys their hopes.

The Professor also was tormented with this blindness, and troubled by the demon. He had found nothing. Many would have been weary and given it up, but his eagerness only increased, for he did not, by any means, search heedlessly; he knew very well that the discovery depended on a long chain of accidents which were beyond all calculation. But he wished to do all in his power; his task was to give assurance to the learned of the world that the archives, collections, and inventories of the Sovereign had been thoroughly examined. This certainty at least he could obtain better than any one else, and he would thus do his duty both to the Sovereign and to Learning. But his impatience became more eager, and the cheerful excitement he felt at first increased to uncomfortable agitation; constant disappointment disturbed his daily frame of mind. He often sat lost in thought, nay, he was always speaking of the treasure, and Ilse could not please him; her objections and even her consolation wounded him, for he was very much vexed that she did not partake of his zeal. He knew accurately what would be the appearance of the manuscript—a large, thick quarto, very old characters, perhaps of the sixth century, much faded, and many leaves half destroyed, for he could not conceal from himself that the mischievous spirit of the times, water and the rats, might have made havoc with it.

One day the Professor entered the Princess's study with heightened color.

"At last I can bring you a good report. In a small bundle of deeds in the Marshal's office, which had hitherto unaccountably escaped me, I have found a lost entry on a single sheet. The chests which the official at Bielstein sent in the beginning of the last century to the vanished castle are briefly designated as numbers one and two, with a remark that they contained besides old cross-bows, arrows, &c., manuscripts of the monastery of Rossau. Thus, there were two chests with manuscripts of the monastery in them."

The Princess looked with curiosity at the sheet which he laid before her.

"It was high time that this account should come to light," continued the Professor, gaily; "for I confess to your Highness that the phantom pursued me day and night. This is a valuable confirmation that I am on the right path."

"Yes," cried the Princess, "I am convinced we shall find the treasure. If I could but help you a little. If it could be obtained by magic, I would gladly put on my magic girdle and call upon Lady Hecate. Unfortunately this mode of calling spirits to one's aid is out of date, and it is difficult to learn the secret art by which learned gentlemen unearth their treasures."

(To be continued.)

BOOK REVIEWS.

ESSAI SUR LA METHODE EN METAPHYSIQUE. P. Dubuc, Docteur ès-lettres, Professor de Philosophie, au Lycée Danson de Saily, 1 Vol. Paris: 1887. Felix Alcan.

M. Dubuc, in his treatise, emphasizes the necessity incumbent upon metaphysicians to direct their efforts to the preliminary question of method. Modern philosophers have, indeed, attempted to organize metaphysics by the importation of scientific processes into their investigations of first principles and first causes. The Cartesian School had endeavored to construct the science of being by means of the mathematical method; the school of Locke and Condillac affected to attain the same result by the experimental method, and the Scottish School, by the psychological method. Finally Kant, in his "Critique of Pure Reason", opened a new pathway for philosophical studies. M. Dubuc is of opinion that this new method has not so much the power to build as the power to destroy. "It is the glory of those who devise new methods," he says, "that their theories—to the triumph of truth—are afterwards overturned through the power of new processes that their own ideas have introduced into science."

Consequently, he believes it possible, to abandon, in the work of Kant, the method of the system, and proceeding from the premises of the critique, to attain to a doctrine different from transcendental idealism and to effect a restoration of theistic and spiritualistic dogmatism.

THE HISTORY OF THE ROMAN REPUBLIC. Abridged from the History by Prof. Mommsen. By C. Bryans and F. J. R. Hendy. New York: 1889. Charles Scribner's Sons. Chicago: A. C. McClurg.

"Our abridgment of the history of Prof. Mommsen," are the words of the preface to this work, "must of necessity give but a feeble and inadequate idea of the original; but something will have been accomplished if we have given some conception, however faint, of that original, and have induced fresh inquirers to read for themselves those pages so bright with wisdom and imagination." The text and spirit of Prof. Mommsen's researches have been studiously followed. No attempt has been made to compromise the differences that have arisen in the province of Roman historical criticism. In the treatment of all disputed points the authority of Mommsen, as conforming with the expressed purpose of the work, has been accepted and presented. The work of abridgment has been accomplished by Mr. Bryans and Mr. Hendy with commendable tact and felicity. Far from ever having descended into dullness, which they profess has been their purpose as far as possible to avoid, and which if present must be attributed to their unskillfulness, the authors have unquestionably heightened the character of their production by the infusion of personal sympathy and zeal for their task. The style is terse and graphic. So far as we have compared the abridgment with the original, the salient features of the great historian's work have been preserved. To each chapter is appended a list of authorities, and an epitome of the original sources of Roman history precedes the opening chapter. It has been thought wise not to insert maps. True, most of us have an atlas of Ancient Geography at hand, but those who have not will regret the omission.

μσρκ.

Mr. Singleton W. Davis, of 916 Third Street, San Diego, Cal., has published a little work, *Sketches Of The Scientific Dispensation of a New Religion*, composed by the printer-author as he stood "before his congregation of sleeping type." Price 20 cents.

The Kindergarten, for teachers and parents, is an illustrated monthly, containing typical lessons and stories adapted to home and school. Kindergarten methods for primary teachers, and also nursery occupations are the important and practical features. Price \$2.00 per year.

D. C. Heath & Company, of Boston, have just published *Lamartine's Jeanne d'Arc*. The work is edited with notes and vocabulary by Prof. Albert Barrère, of Woolwich, England. It is intended to form an easy introduction into French prose for students of schools and colleges. The divisions seem well adapted to classroom purposes; the style is simple and suitable to young pupils.

Among the many interesting articles in this month's *Magazine of American History* is an entertaining sketch of German social and family life, by Gen. Alfred E. Lee. The picture Gen. Lee presents us, is written with enthusiasm and undoubted admiration of the amenities of life in Germany. The series "Historic Homes and Landmarks" is continued by Mrs. Martha J. Lamb; the interesting portraiture of early American life are drawn in attractive and sober characters.

We have received from Prof. G. T. W. Patrick, of the State University of Iowa, a copy of his work upon Heraclitus of Ephesus. The essay, which consists of a translation of the Greek text of Bywater, with an historical and critical introduction, was accepted in 1888 as a thesis for the degree of Doctor of Philosophy at Johns Hopkins university. The fragments that the ingenuity and patience of scholars have collected and emended into an interpretable form, number one hundred and thirty. The scope of Heraclitean research, therefore, is limited. Moreover, this scanty collection of remnants has been made from the citations of other writers, from Plutarch and Philo, from Clement and Origen. The layman, thus, will hardly understand the critical and scholastic labor expended in this branch of philosophical inquiry. "But the interest of the philosopher of Ephesus," says Professor Patrick, "is historical;" the way to study philosophy we have discovered to be investigation of its history; we are to seek in these and like fragments the sources of errors as well as the genesis of doctrines. Notwithstanding the academical character of its title, the style and spirit of the monograph is within the reach of even tyros in the history of philosophy. *The Fragments of the Work of Heraclitus of Ephesus on Nature*. N. Murray, Baltimore.

NOTES.

The essays of Th. Ribot upon the "Psychology of Attention" have just been published in book form by Félix Alcan, of Paris. We shall have occasion to note M. Ribot's work more particularly in a later issue.

The second edition, revised and enlarged, of Lucien Arréat's *La Morale dans le Drame, l'Epopée et le Roman*, (Félix Alcan, Paris), has appeared. The work will be reviewed in a future number of THE OPEN COURT.

We have received an attractive little pamphlet from E. Petavel-Olliff, of Lausanne, entitled, *Coup D'Oeil sur l'Immortalité Facultative*, treating of the historical and theological genesis of the idea of immortality. An appendix is added with a list of Bible references from which the biblical theory of immortality may be derived.

A life-sized statue of Giordano Bruno is to be erected, in May next, upon the Campo de Fiori, at Rome. The consent of the municipality has been obtained, and history will now do justice to the proto-martyr of liberal thought on the very spot where three hundred and eighty-nine years ago he was burnt alive. A committee for the United States has been appointed to assist in raising funds. Their names are, Robert Ingersoll, T. B. Wakeman, Daniel G. Thompson, and Thomas Davidson. Subscriptions from \$1.00 upwards to be sent to the treasurer, T. B. Wakeman, 93 Nassau St., N. Y. City. We hope that America will contribute generously to this noble project.

WANTED!

An energetic and educated person wanted in every town, city, and district, to canvass for subscriptions to **THE OPEN COURT**; liberal compensation. Address, with references,

OPEN COURT PUBLISHING COMPANY,
P. O. Drawer F., Chicago, Illinois.

A BIOLOGICAL MONTHLY.

The "AMERICAN MICROSCOPICAL JOURNAL" is the cheapest periodical in the United States devoted to this branch of science. No biologist should go without it. Price, \$1.00 per year; 12 cents per copy

"UNITY."

With the first of March, 1899, this paper enters upon its eleventh year in an enlarged form, so that it can print each week a sermon representative of its message and mission, and at the same time it hopes by an addition to its present list of fifteen hundred new subscribers to reduce the price to a dollar, *i. e.*, to increase the capacity 25 per cent. and reduce the price 33 1/3 per cent. **UNITY** is the organ of the National Unity Club Bureau, it has fostered and to a large extent shaped the Postoffice Mission work, it believes in and works for People's Churches and inclusive religion. It is suspicious of sectarian tendencies and dogmatic exclusiveness. It believes that religion should be friendly to science, and that it is indebted to its triumphs. It seeks to make religion a part of and essential to all human helpings. It would make Rationalism reverent and Reverence rational. It is in search of the unities of universal religion that reaches from the Catholic Church to the Ethical Culture Society, that includes the perennial elements in Christendom, Judaism, and all other forms and names that have purified, sweetened, and ennobled life.

SPECIAL OFFER

To Readers of "The Open Court" only.

For \$1.50 we will send "UNITY" beginning with the number current on receipt of order and continuing to March 1, 1899, and will mail one each of the following pamphlets:

Truths for the Times. By Francis E. Abbot.
Natural Religion. By James Vila Blake.
The Present Heaven. By O. B. Frothingham.
The Religion of Jesus. By H. M. Simmons.
On the Vision of Heaven. By F. W. Newman.
Is Romanism Real Christianity? By F. W. Newman and Francis E. Abbot.
The Change of Front of the Universe. By M. J. Savage.
Christian Propagandism. By Francis E. Abbot.
Evolution in its Relations to Evangelical Religion. By B. F. Underwood and others.
Compulsory Education. By Francis E. Abbot.
Concerning Immortality. By Frances Power Cobbe, William M. Salter, Henry M. Simmons, Minot J. Savage, and others.
An Address. By Ralph Waldo Emerson.

THE

Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects:

1. The Psychology of the Cell.—Introductory.
2. The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.
3. The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition; Predatory Habits of Certain Animalcula.
4. Colonies of Unicellular Organisms.
5. Recrudescence of Proto-Organisms.
6. Recrudescence of Higher Animals and Plants.
7. The Physiological Function of the Nucleus.
8. Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instanced, apart from the author's original investigations, the researches of Balbiani, Claparède and Lachmann, Mauhas, Ribot, Haeckel, Engelmann, Espinas, Fouchet, Weber, Pfeffer, Kent, Dujardin, Gruber, Nussbaum, Bütschli, Lieberkühn.

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Mr. G. F. Romanes, that the first appearance of the various psychical and intellectual faculties is assignable to different stages in the scale of zoological development.

16 mo, 125 pages. Cloth, 75 Cts, Paper, 50 Cts.

"The Week, one of the ablest papers on the continent."—*Descriptive America.*

ENLARGED AND IMPROVED.

"THE WEEK,"

A Canadian Journal of Politics, Literature, Science, and Art.

Published every Friday. \$3.00 per year.
\$1.00 for Four Months.

THE WEEK has entered on its SIXTH year of publication, greatly enlarged and improved in every respect, rendering it still more worthy the cordial support of every one interested in the maintenance of a first-class literary journal.

The independence in politics and criticism which has characterized THE WEEK ever since its first issue will be rigidly maintained; and unceasing efforts will be made to improve its literary character and increase its attractiveness as a journal for the cultured home. Many new and able writers are now, or have promised to become, contributors to its columns, and the constant aim of the Publisher will be to make THE WEEK fully equal to the best literary journals in Britain and the United States.

As heretofore, PROF. GOLDWIN SMITH will, from time to time, contribute articles. London, Paris, Washington, and Montreal letters from accomplished correspondents will appear at regular intervals. Special Ottawa Letters will appear during the sessions of Parliament.

THE WEEK in its enlarged form will be the same size as "Harper's Weekly," and the largest paper of its class on the continent.

Review of Recent Work of THE OPEN COURT.
PSYCHOLOGY AND BIOLOGY.

- EXPERIMENTAL PSYCHOLOGY IN FRANCE. ALFRED BINET.....No. 74.
DREAM, SLEEP, AND CONSCIOUSNESS. DR. GEORGE M. GOULD.....Nos. 74 and 75.
BODY AND MIND; OR THE DATA OF MORAL PHYSIOLOGY. FELIX L. OSWALD, M. D....Nos. 72, 75, 78.

M. BINET's entertaining sketch of the state of Experimental psychology in France is the only direct and convenient source from which the reader can obtain a comprehensive idea of the contributions the author's country is making to this branch of mental science. The work of psychologists in France is distinguished by its almost exclusive bearing upon the pathological phases of psychological phenomena. The greatest successes of MM. Ribot, Richet, Charcot, and others, have been in treating the *diseases* of the mind.

PHILOSOPHY.

- SENSATION AND MEMORY. EDITOR.....No. 74.
COGNITION, KNOWLEDGE, AND TRUTH. EDITOR.....No. 76.
MONISM AS THE FORMAL PRINCIPLE OF COGNITION. .No. 78.

In the two first discussions, the conditions and processes by which we start from the bare excitations of the sensory world and attain to knowledge, are unfolded. Sensation is the primal condition of all knowledge; the products of sensation are preserved and transmitted as psychological forms; the psychological law of this retentive power is memory, from which source are evolved the different branches and varied forms of human thought.

The last essay of this series shows that the constitution of the human mind naturally predisposes man for Monism. The unitary conception which the intellect seeks to formulate respecting all things brought within its range, is the inward proof offered to us of the correctness of the monistic philosophy. Monism is thus a subjective principle, informing us how to unify knowledge and make it potent.

- AXIOMS THE BASIS OF MATHEMATICS. DR. EDWARD BROOKS.....No. 76.
THE OLD AND THE NEW MATHEMATICS. EDITOR.No. 77.
A FLAW IN THE FOUNDATION OF GEOMETRY.

HERMANN GRASSMANN.....No. 77.

In No. 76, Dr. Edward Brooks of Philadelphia, takes exception to an editorial thesis that "mathematics is unfortunately constructed on axioms." To Dr. Brooks no other way of construction is possible. There exist "*first truths* or *axioms* which the mind has power to cognize," which are incapable of proof, and which every system, even though nominally rejecting them, nevertheless tacitly employs. The editorial answer to Dr. Brooks, in No. 77,

is based upon the principles unfolded in the series of disquisitions on "Form and Formal Thought," in Nos. 64, 66, 67, and 69. Axioms so called, are the *result* of reasoning, and not the basis of it; the laws of formal thought determine the correctness and necessity of a proposition; conformity, in every instance, with these laws alone makes a truth universal. The relations of actual, material space have thus universally coincided with the laws of a formal system of third degree, and hence the rigidity and finality of those relations. In the same number, a translation from Hermann Grassmann's "Theory of Extension" is presented; it contains the fundamental points of departure of the new geometry from the old. No English version of this epoch-making work exists. The discussion will greatly interest those who have given their attention to the philosophy of mathematics.

SOCIOLOGY AND ECONOMICS.

- HENRY GEORGE AND LAND TAXATION. WHEELBARROW.....No. 73.
SYMPTOMS OF SOCIAL DEGENERACY. MONCURE D. CONWAY.....No. 74.
MAKING BREAD DEAR. WHEELBARROW.....No. 78.

WHEELBARROW opposes Mr. Henry George and the doctrine of Land Taxation with proper regard for the truth contained in the distinguished economist's theories. Objection is mainly taken to the universal curative power that the advocates of Land Taxation claim for their remedy. In man's obedience to moral laws Wheelbarrow finds the only magic wherewith to change the face of society.

Much criticism has been elicited by the bare mention of Mr. George's economical doctrines—indubitable testimony of their popularity and strength. Letters have appeared in No. 79 and others will follow.

"Symptoms of Social Degeneracy," Mr. Moncure D. Conway finds to be not infrequent even in American civilization. We are prone to emphasize the survivals of barbaric institutions in effete Europe, while overlooking the excrescences of our own body politic. Lynch-Law, literary piracy, corruption in administrative circles, are signs of the decay of an ethical system and the theology that protects it. Worst of all, these evils are not unaccompanied with attempts at palliation.

HISTORICAL AND CRITICAL.

- THE STUDY OF SANSKRIT. H. OLDENBERG....No. 79.
ASPECTS, CHRISTIAN AND HUMAN. WILLIAM R. THAYER.....No. 79.

The study of Sanskrit, upon which a series of articles commences with No. 79, is a department of historical research comparatively new. Prof. Oldenberg, one of the most eminent Sanskrit scholars of the present day, tells us in popular language the story of the origin, growth, and present state of Sanskrit research. This department of philological and historical inquiry has done more than any other towards the true interpretation of the early history, civilization, and religion of the Aryan peoples. Within less than a century results have been attained, of which former generations would not have presumed to think. The articles have been translated from the German.

Under the title of "Aspects, Christian and Human," Mr. W. R. Thayer maintains in lucid and earnest language that the influences and forces to which the great changes wrought in modern society must be attributed, have not proceeded from sources essentially Christian. These advances are distinctly secular and human in character. "Not the preacher, but the poet; not the politician, but the untrammelled agitator, men whose tongues were free, and whose hearts were fearless, have been the heralds and champions of better things."

THE DILEMMA OF A DOUBLE ALLEGIANCE.

THE SAMOA QUESTION FROM AN ETHICAL STANDPOINT.

BY GEN. M. M. TRUMBULL.

EIGHT years ago, when Mr. Blaine became Secretary of State, Col. Ingersoll in an effervescence of loyalty to the "plumed knight," said, "Now we shall have more of the Eagle in our foreign politics, and less of the Owl." The contrast was impressive, and the extremes thus figuratively shown described the situation.

Again is Mr. Blaine the minister for Foreign affairs, and the old comparison is revived. The Owl retires, and the Eagle towers in his former pride of place. It may not be certain which is the more valuable bird in the qualities of intellect and wisdom, but there can be no doubt that the Eagle is most popular. For all that, should Nature form a ministry in a republic of birds, the Eagle might be Secretary of War, but the Owl would be Secretary of State.

The American air throbs with electric passion, as when the "long roll" is beaten on drums. Our politics is highly seasoned with saltpetre. The old war-spirit that must have battle-foed once in a generation, is hungry again. The most popular man is the aggressive man; the loud and arrogant preacher of the inverted and perverted gospel, "strife on earth, ill-will to men."

The Indian savage who votes for peace stands dishonored in his tribe; he is called a squaw. Our Christian men, although absolutely secure from hostile tribes of other Christian men, shiver at the nickname like the savage. A statesman in the American Congress, recently said that a foreign war was desirable in order to unite the "two sections" of our own people in the bonds of peace. His colleague echoed the sentiment, and there were no statesmen in the capitol brave enough to rebuke it. They feared the nickname. All joined in the Satanic benediction, "Blessed is the war-maker, for he shall inherit contracts and gold. He shall set brother against brother, and lay taxes upon generations yet unborn;

'His pride and hate shall make this green earth red,
And wives and children speak his name with dread.'

It is charged by doleful soothsayers that the American Republic is falling apart, because of its inherent moral weakness; and members of the American Congress plead guilty to the charge. Shall this plea re-

corded inside the capitol be confessed by the people outside? Shall it go forth to the envious world that this enlightened government must perish by reason of its righteousness, and that the "two sections" of it cannot live in domestic peace unless engaged in foreign war? If that is true, we ought to celebrate the centennial of the constitution not in gladness but in sorrow.

A nation with an appetite for war can easily find reasons for a fight. At this moment we are lucky as the ass between two bundles of hay, and like him we know not which to enjoy. We are blessed with two quarrels, one with England about Canada, and another with Germany about Samoa. Either can be inflated into a big enough pretext for war. Shall we fight England or Germany?

The inaugural message talks at Germany. It says nothing about the codfish dispute with England, but significantly hints that our "coaling stations" must be preserved. The importance of our "coaling station" at Samoa, was pointed out by the consul in his information that we have no coal at Samoa, never had any coal there, and need none there. "No matter," said the Department, "send some coal there. Let it not be said that the absence of a few bushels of coal at Samoa furnished a pretext for peace."

The coal is on the way to Samoa.

The very hint of war with Germany or England brings a novel question into American debate. It presents to the Germans and the English who are citizens of the United States the dilemma of double allegiance. What is the ethics of patriotism that must guide them in case of actual war? How shall they apportion their allegiance between the land of their fathers and the land of their children? This is a question almost appalling in its pressure upon the conscience of any foreign born American citizen who is truly loyal and patriotic, and who desires to do his duty, whatever it may be.

When the challenge of Bismarck first appeared, if it was a challenge, as some eagle-minded people claim it was, a reporter in Chicago interviewed several Germans of that city, to ascertain what attitude the Germans in America would assume in case of war. The information he said he got was that they would rush eagerly to the army and navy to fight against the

fatherland. Those reported answers must be looked at with suspicion. No man is anxious to fight against his fatherland, and least of all a German or an Englishman. Nor would the Americans require such a sacrifice, except in an extremity that can never come.

A German may renounce his political allegiance to Germany, but his natural allegiance of love and veneration for the fatherland he will never cast away. He could not do so if he would, and retain the respect of the American people; for magnanimity and love of country are conspicuous traits in the American character. What then is his duty in the contingency supposed?

His oath of allegiance to the United States is decisive as to the political status of every naturalized foreigner here. His political duty is to the land of his adoption, but he is not therefore compelled to renounce his natural reverence for the land where he was born. The Americans would never ask a German to fight against Germany, unless a German army were actually landed on our soil, an impossible contingency, for no foreign army could land in any part of the United States and advance ten miles without being captured or destroyed. To require a man to fight against his father and his mother would make still more hideous the monstrous anomaly that war presents in Christendom to-day.

Next to the Americans the Germans are the largest constituent element of the American Republic. The Britons and Canadians come next in contribution of numbers to the nation. Neither of these classes can think of the possibility of war between their birth-land and their adopted land without feelings of grief and pain. To them such a war could have no victories and no joy. Whichever side might win a battle they must mourn, either for the defeat of their fellow citizens, or their fellow countrymen. In any event their tears must flow.

The issues involved in the dispute with England about Canada, and with Germany about Samoa, cannot be whipped into an inflammation that will justify an act of war on either side. They are scarcely above the jurisdiction of a police court. The decision of an ordinary justice of the peace upon their merits would be happier in the end than any decision of guns can possibly be. Let arbitration settle them.

In a contest for material prosperity between his native land and his adopted land, the patriotic sympathies of a foreign born citizen will incline to the land of his adoption, but his merely sentimental or emotional patriotism will incline to the land of his birth. We cannot change this until we can alter the spiritual nature of men. There are ten thousand strings that unite a man to all his ancestors; there are none that unite him to his posterity. For these reasons his

prejudices make it very difficult for him to believe that in any international dispute his native land can possibly be in the wrong.

It may be useless to moralize in the face of experience. Whether just or unjust, wise or unwise, an aggressive policy will be popular. It is in harmony with the traditions, the practice, and the ambition of the Anglo-Saxon race. That it tends to war does not weaken it, for the Americans have a dangerous talent there. The owl policy may be dull and lack the stimulant of blood, but after all, the true mission of this country is to promote friendship and good will among nations, the advancement of art, science, industry, and good morals. Her lasting glory will consist in the victories of peace.

Although we hope for peace we are compelled to recognize the passions of men, the qualities of races, and the political forces that control the world. We see in what are called the Anglo-Saxon races a conquering element pressing steadily forward to universal empire. Their march appears to be resistless. Starting from the low lands of Germany, a little more than a thousand years ago, they have already conquered Great Britain, the United States, Canada, Australia, India, and the islands of the sea. It may be that their fighting habit has become an instinct that must be gratified.

Although Europe is an armed camp, the martial feeling there is not so strong as here. Most of the soldiers there are unwilling conscripts, drafted men; here all of them are volunteers chafing in war harness without war. The military passion rages here like a moral scarlet fever. The political surgeons invoke the warrior's lancet, they say, "we must let blood." Meanwhile, war memories are kept alive by a thousand agencies, and chivalrous battle deeds are set before our youths for emulation. The inflammation is continually fed. Unless it can be allayed a fiery eruption must make an outlet for the pent up valor and the patriotic phrensy of our sons.

In the statesmanship of party a low standard of political ethics may co-exist with a high standard of political sagacity. Party leaders, when in office, never oppose a war sentiment predominant in the people. They give it, for the honey in it, with much clangor of tin pans, as the farmer hives bees.

There is great swarming of military bees just now, and their hum has a trumpet sound, like the cavalry-calls to charge. There are regimental, brigade, and division re-unions; gatherings of Grand Armies of the Republic, sham battles, and much flattery of warriors from pulpit, press, and stump. Then we have military schools, where children are dressed in soldier clothes, armed with baby swords and ranked and filed as Captains, Corporals, and Privates. Above them

again we have militia and independent companies armed and uniformed. These "hold their manhood cheap" when they march in Fourth of July processions with veterans who have actually fought in war. Must they fret away their bravery at county fairs, in harmless dress parades? They are as ready as their fathers were to "prove their mettle true."

The duty of men embarrassed by the ties of a double allegiance is to stand bravely by the republic whatever comes, but they ought to unite their moral and political influence to promote the settlement of all international disputes by peaceful arbitration.

Human progress has been sometimes aided by the sword. There are times when public virtue must defend itself and extend itself by arms. Therefore it is not always true that peace is cheap at any price; but as a general rule the man who maintains that war is dear at any price stands on solid moral ground. Patriotic virtue may be latent in physical and intellectual strength; it may be the very inspiration of armies, but when national greatness prompts men to fight for trivial causes it makes them irrational agents of destruction like the mad winds that sometimes wreck ships and villages.

" 'Tis well to have a giant's strength,
But tyrannous to use it like a giant."

As I raise my eyes from this paper, I see in the corner of my room a sword; off duty let us hope for evermore. The sight of it overwhelms me with mournful memories. I would gladly give all that I have ever had, and all that I have ever been if Tubal Cain would come again, and beat that sword into a pruning hook; if he would order his apprentices throughout the world to do the same by every other sword. If that would cause an "overproduction" of pruning hooks, let them beat them into fence wire, stoves, pots and kettles, or any other gentle, virtuous, and useful things.

PASSIONS AND MANIAS.*

BY FELIX L. OSWALD, M.D.

THE overmastering sway of special passions can often be traced to the influence of abnormal social conditions, tending to suppress the manifestations of various natural instincts, and thus favoring the development of others to a degree of undue prominence. The vehemence of the genetic passion, for instance, with its life-blighting excesses and the reckless despair of its reaction against stubborn obstacles, has unquestionably been increased by the suppression of instincts which found a free scope of development in the social tendencies of Antiquity. During the seven last centuries of Grecian and Roman civilization, patriotism and the enthusiasm of gymnastic emulation counterbalanced the influence of a passion which

during the era of mediæval anti-naturalism acquired a wholly abnormal preponderance, and which still disturbs the moral equilibrium of millions.

Freedom, science, and the love of Nature were for ages persecuted in the name of an earth-renouncing dogma; patriotism, even, was blighted by the delusion which trained all true believers to yearn for the grave as the gate to the proper home of their souls, but the sexual instinct defied control, and consequently became the channel for the united currents of all emotional propensities,—with results which still incline us to greatly overrate the *natural* persistence of a passion, which, under less abnormal conditions, was able to acquire only a decidedly intermittent prominence. Disappointed love, as a cause of suicide, now takes precedence of all other motives of self-destruction, while no other fact in the history of morals is more clearly established than the truth of Peter Bayle's remark, that at a time when suicide was considered justifiable, or even honorable, a free man's desire to leave the world on account of disappointment in courtship, would generally have been attributed to insanity. The women of antiquity had but scant resources outside of marriage, and the example of Dido and Sappho consequently found frequent imitators, while rejected male lovers, with the rarest exceptions, would have laughed down their disappointment after the manner of the poet Ovid—one of the few classic writers who seems to have considered the subject worth any special notice whatever. Love-stories which now almost monopolize the interest of nine out of ten readers (nineteen out of twenty *book*-readers, to judge from the records of our public libraries) were almost unknown to the literary age of Greece and Rome, or were relegated to the sphere of the lowest comedy—even in the era of social license that followed the introduction of Asiatic luxuries. Books of travel and adventure, prize-fight bulletins, ghost stories and ribald satires had long eclipsed the popularity of Homeric heroics, when a writer of love tales would still have been referred to a female clan of readers, or rather of hearers, since persons, even of moderate literary attainments, would not have thought it worth their while to waste an hour with the perusal of other people's courtship twaddle. Werther's wailings would have failed to excite anything but the surprise of a Roman reader, and the end of the romance would have been considered an offense against the laws of probability—not to mention common sense, or the ethics of stoicism. As a motive of self-destruction a temporary tooth-ache would hardly have been thought a more preposterous pretext. Yet it would be a mistake to suppose that in that age of earth-worship the moral obligation of enduring the troubles of an unpropitious life for its own sake was generally overrated. The expediency of ter-

* Copyrighted under "Body and Mind; or, The Data of Moral Physiology." Part XXII.

minating an existence of hopeless affliction was one of the few points in which the disciples of Epicurus agreed with the stoics, and the example of Cicero and Lucretius made them the patron saints of their respective sects. Hegesias, who combined that doctrine with a pessimistic view of life in general, made so many converts that the city of Alexandria, during his presence, experienced a veritable epidemic of suicide, which at last obliged King Ptolemy to banish the philosopher from Egypt. Cassius, Atticus, Cato, and Diodorus held similar views, and Pliny goes so far as to vaunt the lot of man, as "superior to that of the Gods in this respect, that man has the power of seeking refuge in the peace of the tomb." "To death alone we owe it," says Seneca, "that life is not a prison, that erect beneath the frowns of fate a man can preserve his mind unshaken and master of itself. Slavery loses its bitterness, when by a step, a captive can pass to liberty. Against all the injuries of life, we have the refuge of death. You see that yawning precipice? It is the gate of freedom. You see that river, that ocean? Liberty awaits you at the bottom. As we choose the ship in which we will sail, so we ought to choose the death by which we will leave life. In no matter more than in death should we act according to our desire. Man may seek the approbation of others in his life; his death concerns himself alone. That is the best which pleases him most. Fate, indeed, has granted us no better boon than this, that life should have but one entrance and many gates of exit. Why should we endure the agonies of disease and the indignities of despotism, when we can free ourselves from all troubles and shake off every bond? For this reason, and for this alone, life is not an evil—that no one is obliged to live. The lot of man is happy because no one continues miserable but by his own fault. If life pleases you, stay. If not—*jacet janua, exi*,—the door is open. You have a right at any time to return to whence you came."

Nor were such views confined to the disciples of philosophy. Longinus, a commander of the Dacian legions, killed himself in the camp of his captors to save his inferior officers the trouble of treating for his ransom. Tullius Marcellinus, a young patrician of ample fortune, anticipated the development of a troublesome disease by assembling his friends and calmly announcing his intention to starve himself to death. His last days were passed in cheerful conversation; and his faithful attendants, an hour before his death, were dismissed with presents, as from a banquet. A freedman of Otho killed himself at his grave; nay, the younger Plinius mentions a devotee of the circus-sports who flung himself into the blazing funeral pile of a popular charioteer. "From grief without hope," says Musonius, "we may seek refuge in death, even without the fear of direct pain,—in the absence of anything

essential to make life pleasant. Why should we tarry? Let us depart cheerfully, as from a festival.

Neither Buddha nor Schopenhauer could have ventured to speak out more plainly; yet in an age when life, upon slight provocation, was so often flung away like an ill-fitting garment, the mischievous pranks of Amor were almost universally dismissed with a jest, even by votaries of his shrine, while grave statesmen and philosophers would have deemed it beneath their dignity to mention them at all.

Turning to the impulsive natives of the South Sea Islands, as representative children of Nature, we find, in that respect abundant evidence of a similar stoicism. With all their emotional passions, the natives of Tahiti treated the disappointments of courtship as a matter of burlesque and good-natured banter, rather than as a subject of tragic heroics, while the manful New Zealander, with all their love of poetry, would have failed to comprehend the meaning of Petrarca's *Jeremiads*. "Among the Maoris," says Prof. Hochstetter, "married women are treated with comparative indulgence, and the son of a chief does his own wooing as modestly as the poor fisherman's son, but the intrigues of courtship are hardly thought worth a freeman's trouble, and the self-abasement, and self-immolations of our innamoratos would pass the comprehension of a Maori lover."

Those facts throw a suggestive light upon the significance of one of the strangest phenomena in moral physiology, and at the same time illustrate a curious analogy in the pathological principles of physical and emotional life. The fact that a tortoise can survive decapitation, does not indicate the higher value of her existence, as compared with that of a man's, but merely proves the anatomical circumstance that a man's brain is a more important center of vitality than the brain of a tortoise. Nor should we overrate the Pagan standard, of estimating the value of life, because the men of antiquity contrived to endure the torments of a passion that drives millions of our contemporaries to the refuge of suicide. The contrasting fate of ancient and modern lovers does not even indicate the decline of stoicism, but merely proves the fact that the sexual passion has become a more important center of emotional life. True to her principle of eudemonism, Nature reverses the doom of life whenever the scale of weal and woe threatens to preponderate on the side of wretchedness, and the same reason that determines the organism to surrender its life to a cureless injury of the brain, impels the soul to renounce an existence embittered by a deep wound of the predominant affections. During the age of Pagan civilization the aspirations of emotional life were centered upon patriotism, ambition, the love of gain, the love of strength and health. During the mediæval millenium of madness

they were engrossed by religious monomanias counterbalanced by the predominance of the sexual instinct. Since the advent of our latter-day civilization they have been divided mainly between sexual love and the thirst of gain—"amativeness" and "acquisitiveness," as the phrenologists would express it,—slightly modified, perhaps, by the influence of inquisitiveness and the lingering after-effects of supernaturalism. In millions of souls the life-despising mania of antinaturalism has extinguished the love of health and the enthusiasm of athletic emulation, (once the master-passion of manhood,) as well as ambition and patriotism, in the ancient significance of those words. Love, however, has remained, like Hope in Pandora's box, and by monopolizing the energies of other passions now burns like a fire intensified by the fuel of many extinguished altars. A modern Petrarch too often stands really at the grave of his only earthly hope in watching the fatal pallor of a beloved face and closing the eyes

"Which now so faint and dim,
Held all the light that shone on earth for him;"

and in the words of Musonius, the gate of suicide becomes a welcome refuge from the consciousness "of a loss involving all that could have made life pleasant." Hence, also, the suggestive fact that the frequency of love-suicides increases with the prevalence of conditions tending to limit the energies of passion to the sway of the genetic instinct.

Werther tragedies, in fact, are far more frequent in the crowded cities of our Atlantic seaboard than on the hunting grounds of Texas and California, but after all, less frequent in the largest cities than in the Sabbatarian atmosphere of small country-towns, deprived of amusements, deprived of outdoor-sports, reduced to the alternative of prayerbooks and novels. In commercial communities dollar-worship offers a welcome trilemma, and may monopolize the emotional energies to a degree developing an ultra-Pagan indifference to the caprices of Love, but, on the other hand, involving the risk of a complete moral collapse upon the sudden loss of a prop supporting the hopes of the ruling passion. Suicide as a consequence of financial disaster, is, indeed, becoming an international phenomenon, not always confined to the confessed centres of Mammon-worship, the most characteristic instance being, perhaps, the case of a Swiss soldier who picked up a heavy pocketbook in the grass of a lakeside promenade and sat down to examine its contents. In addition to a number of illegible letters those contents included a large roll of paper-money—white Bank of England notes, quite unlike the French equivalents which the finder had now and then seen in the restaurants of his native town, and after scrutinizing the shape of a Brahma key, hardly apt to fit any local lock, the young native concluded that the miscellany of out-

landish objects was of no value to any one but the rightful owner and determined to report his discovery at the police-station and register his name as an applicant for any possible reward. The sensation caused by his announcement was equalled only by his surprise, when he learned that the owner had offered a reward of five thousand francs, and a dismal misgiving was more than verified when further inquiries elicited the fact that the pocketbook contained a sum of eighty-five thousand francs in notes that could have been changed at any city-bank. The officials shook the hand of the honest finder; newsmongers crowded in and congratulations were followed by a round of applause, but the soldier staggered out in the street like a man reeling under the effect of a deadly blow, and a few hours after his corpse and a horse-pistol were discovered in an orchard-grove of Hottingen, a short distance from the promenade where he had found and wasted the chance of realizing the day dream of his life.

ASPECTS, CHRISTIAN AND HUMAN.

BY WILLIAM R. THAYER.

III.

HE must have a hard heart who has never been touched by that episode in early English history when, after the Romans had withdrawn their last legions from Britain, the Britons, who had learnt from their conquerors the softness but not the strength of civilization, were desperately harassed by the hordes of Picts and Scots from the north, and by the invasions of barbarians from beyond the sea. Messengers hurried to Rome, to bear the "Last Groans of the Britons." "The barbarians on the one hand chase us into the sea; the sea, on the other, throws us back upon the barbarians; and we have only the hard choice left us, of perishing by the sword, or by the waves. Send back thy protecting legions, O Rome, or we die!" So implored the Britons in their distress; but Rome could not succor them. Foes, who should have been her friends, and barbarians who had always been her foes, now encompassed her unto death. Aëtius, her last champion, was vainly struggling to defend her against Attila; and thenceforward no Roman phalanx went to save the Britons from destruction.

Methinks that throughout Christendom there has long resounded, and still resounds, a cry, as frantic and pathetic as theirs, of men in spiritual distress. "Come back! come back!" they call out to those dogmas which, like the Roman mercenaries, so long upheld them. "Come back in your old-time might, ere the wolves of infidelity devour us, or the waters of despair wash over our heads!" But the departed come not back.

Who shall describe the panic, the anguish of men who feel the immemorial bonds of religious tradition bursting asunder? Voyagers tell us that in the Polar Sea, after many tranquil days of mild Spring weather,

the ice-floe suddenly cracks and breaks up, with a tremendous roar; and what was but just now a solid plain whereon a whole nation might safely encamp, splits into a thousand fragments—some huge as mountains, some mere spars and splinters of ice, which jostle and grind and shatter and overturn each other, as all begin to drift slowly at the mercy of wind and tide.

So might one picture to himself that spiritual cataplysm known as the Decay of Faith: except that the rending is less sudden, and is perceptible to the mind's eye alone. At first, it is whispered as a rumor, then it is confidently proclaimed as a fact, that God has withdrawn himself from interposing in earthly affairs. He has withdrawn, leaving his viceroys—natural laws—to work out his purposes. But ere long, fearless sceptics affirm that there never was, and is not now, a God: that the universe is but a monstrous clock, whose wheels were wound up spontaneously and revolve inexorably—a machine which had no maker and has no director. Fix your eyes on the tiniest froth-bubble which twinkles a moment ere it is whirled over the brink of Niagara: so insignificant is this Earth compared with the multitude of the stars, innumerable and immense. "What!" exclaims the pious, "was not Earth, despite her insignificance, chosen by the Almighty to be the especial home of man? Was not the sun created to warm him? And are not all beasts and fowls and fishes to serve him?"—"Nay," replies the man of science, "this tiny sphere you tread was cast off from the sun, like a spark from the wheel of a lapidary. The Animal Kingdom was not made for you, but you are descended from it: yourself and your horse had the same ancestor; the haughtiest prince is but cousin to the clam."—"But what of man's destiny? of the miraculous revelation of religion? Of the war between good and evil? Of man's hope of immortality?"—"Experience and the records of science prove that immutable laws have always prevailed. Of man's destiny, we can know nothing: what has been we state, what may be we cannot guess. Nature begets millions of creatures, among which the weak perish and the strong survive, till these in turn are superseded by stronger species. When the body dies, it is dissolved into its elements, and disappears."—"O my brother, what help? What consolation?"

In an epoch when this cry of anguish is sent up, and the deaf heavens hear it not, the native qualities of men show themselves most plainly in their conduct. Those to whom religion was a check, toss the reins to their appetites, as thieves exult when the police are summoned away to a fire. Some men turn satirists and cynics, and make sport of the arrogant pretensions—suddenly collapsed—of their religious fellows. The ravens of pessimism croak from many a tree. The indifferent are languidly complacent, because indiffer-

ence now seems the highest wisdom. The stubborn-pious cling desperately to the chance that a flaw in the evidence will be discovered. Some are defiant: they will continue to live as if the assumptions of their creed had not been undermined. The timid caress and cherish the familiar symbols of worship, as a bereaved mother fondles the toys and garments of her dead child,—and try to believe that the lost will return. Some there are who ransack the past, lest the vital truth buried in an earlier religion may have been overlooked: perchance Confucius, or Zoroaster, or Buddha had the secret. Some plunge into the vapors of spiritualism, and snatch at reports of haunted houses and 'materializations' to justify their folly. Many are the look-outs on towers and high places, who strain their eyes eastward for the first streaks of dawn, while in their heart gnaws the doubt that night may have closed in forevermore. Some fortify themselves with the precepts of the wise men, and the examples of the noble. The brave resolve that death alone shall rob them of their courage: like that regiment of English soldiers who, when their transport-ship was foundering in the Bay of Biscay, marshaled themselves in battle-order on the deck, and went down singing their songs of victory.

These are some of the signs by which the Decay of Faith is made manifest: unspeakably tragic to any mind capable of scanning it, and not be understood by the strongest minds. Here is a mystery seen in the guise of agony: no fabled head of Medusa, but a real horror, which paralyzes most of its beholders. Think of it—the relations of men's souls to their spiritual source appear to be hopelessly destroyed! Many earnestly asking, "Have I a soul?" Many seriously answering, "No." Very noteworthy, moreover, is the course of this infection. It steals on so gradually that its victims are not soon aware of it. Not in a day, nor in a year, does it eat its way to the vitals of society. Outwardly, you hardly observe a change. Men eat and work and sleep, as of yore. Business and trade, theatres and entertainments, still occupy or amuse them. In the churches there are still preachers, and congregations to listen to them. There is the perennial wrangle over politics; the daily snarls and squabbles of the critics. Proclamations of thanksgiving to the Almighty are issued; Fourth-of-July orations are spouted; startling inventions and scientific discoveries are announced. We are delirious in our adoration of Progress: only yesterday a new churn was patented; a new asteroid catalogued! But while the malady—*world-ache*, the German experts call it—is invisible on the surface, it spreads pitilessly through every vein and artery; and even when it can be concealed no longer, men's casual behavior alters little. They feign hopefulness or nonchalance: but by the lack of cheer

in the voice and of lustre in the eye, we know that the change has come.

The Religion which dreads to wake up in the morning, lest Science in her midnight vigil shall have made a discovery which threatens to banish God from the universe, can be housed in no solid home of Truth. What? shall the telescope or the alembic be taken as an irrefragable witness, if it testify that the soul of man—whence sprang the ingenuity which fashioned those very instruments—is but a fantastic unreality? Considerations of natural bulk and area seem to me irrelevant in spiritual concerns. My belief in immortality would never be shaken by knowing that the earth is but a speck among the constellations, and that I myself am but an atom compared to the earth. To the ant I am a colossus, as the ant is to the microbe: which proves relativity in size, but nothing absolute. Material standards of more-and-less apply not to the intellect and the soul. No one has observed that men six feet tall are more learned or more benevolent, than men of five feet six; or that dwarfs add to their wisdom by mounting on stilts. Do you measure love by the yard, aspirations by the peck? Those intuitions which urge us towards perfection, would not be more valid were our globe as vast as Sirius: the Texan's chance of immortality is not several hundred times greater than the Rhode Islander's.

Biologists have, indeed, hit upon a formula which helps them in their experiments. They now "envisage the animal mainly as a machine in which potential energy is being transformed back again into kinetic."* A short and easy saw for scientific purposes, but of slight perceptible value for understanding human animals in their complex social relations. I suspect that the sun's disc will have shrunk many leagues, causing a glacial atmosphere to wrap the earth, ere men estimate their passions by so many foot-pounds of potential or kinetic energy.

I had rather, on the contrary, seek in our material insignificance, and in our inability to express ourselves by algebraic or chemical notation, prognostics to justify our loftiest visions of destiny. Regarding this wee creature, Man, as a body, a combination of physical forces, how contemptible he seems! An ounce of lead, a breath of air, a mislodge grape-seed, any one of a thousand accidents, may bring him to the dust. Yet is this pigmy a partaker of Time and Space. Eternal Force does not slight him, but must work for and in him. There is no property of matter which may treat him as a thing of no consequence. And who shall state the wonder and variety to which his soul is heir? In that invisible mind of his he carries the conception of a universe, of eternity, though he cannot understand them. He beholds himself a sharer in the

infinite. Through his fingers slip the chords which unite the farthest past to the farthest future. Every discovery of science which reveals new splendors in our habitation, adds to the majesty of us who dwell therein. And in our hearts these unutterable thoughts, these visions aimed beyond space and time, these unquenchable longings, this love which flows out from us to our fellows, and from our fellows to us—whence are they? Not in the material universe can you discover their origin: not in the world of matter can you discover fulfilments which will satisfy them.

HEDONISM AND ASCETICISM.

A SYSTEMATIC conception of the universe is the theoretical, and ethics the practical aspect of philosophy. It is obvious that both are closely associated; the one is the basis of the other, and we cannot properly judge of the problems of the latter unless we have grasped the main truths of the former.

By "morals" we understand the proper conduct of life, and by "ethics" the science of morals. Now, it is true that a man can instinctively lead a moral life without having any knowledge of the theoretical basis and the practical application of ethics. Morals are, as a rule, very stable, and a moral man who in later years happens to believe in a wrong system of ethics is not liable to change much of his good habits of life. It is also true that a man who has inborn, perhaps hereditarily ingrained, immoral tendencies will by theoretical instruction in ethics most likely not be greatly improved. Nevertheless, as a rule, philosophy and ethics go together, and a wrong philosophy will produce a wrong ethics, and a wrong ethics will, if not in the present, certainly in the next generation, corrupt the morals also.

The details of a philosophy, or a religion (which latter, after all, is but a popular philosophy, a philosophy of the heart) may be, and, indeed, are, quite indifferent as to the ethical inferences that can be drawn from it. But the main truths are not. The main truths of a religion or philosophy lend the color to the ethics that grows therefrom. And we find in the history of philosophy that materialism, with a great regularity, produces hedonism or utilitarianism; for it places the ultimate object of life in material existence and its well being, *viz.* in happiness. Spiritualism, on the other hand, as a rule, leads to asceticism; it renounces the pleasures of the world, for it seeks the object of life in the deliverance of the soul from the fetters of the body. Monism rejects both views; it finds the purpose of existence in the constant aspiration of realizing a higher and better, a nobler, and more beautiful state of existence. Life is a boon so far only as it offers an occasion to improve that which lies in our power to change—the forms of things and the modes of life. It is not

pleasure or happiness that gives value to our days, but the work done for the progress of our race. Moses expresses this truth most powerfully in a passage of his grand psalm, which we quote according to the forcible translation of Luther: "Man's life will last three score years and ten, or, at the best, four score; but if it was precious, it was of labor and sorrow."

Mere happiness will leave the heart empty, and the aspiration for happiness will make of man a shallow trifter. Asceticism, on the other hand, will prove destructive and suicidal. But if we consider the punctual performance of our daily duty, every one in his province, as the object of our lives, which must be done to enhance our ideals and help mankind (be it ever so little) to progress, we shall find occasion to unite the truths hidden in both,—the materialistic and spiritualistic ethics. We shall find sufficient occasion to practice abstinence, to exercise self-control, and to set aside the fleeting pleasures of the moment. At the same time, while the pleasure-seeker will be wrecked in his vain endeavors, we shall experience that a noble satisfaction, which is the highest kind of happiness imaginable, follows those who are least concerned about enjoyment, and steadily attend to their duty.

P. C.

THE STONES OF MANHATTAN.

BY WILLIS FLETCHER JOHNSON.

I TREAD the stones of Manhattan; I, who have journeyed far
From the meadow-sward and the moss-bank, and the streamlet's
pebbly bar;

I, who have wandered hither, allured by the tales they told
Of how the stones of Manhattan were reeking with ruddy gold.

In the dear old mountain woodland, where maple and birch and pine
Were linked with the swaying reaches of purple-clustered vine,
Where violets blue and yellow, and crimson lilies grew,
And the hawthorn's bloom in spring-time was studded with starry
dew,

Over the shelving ledges, over the granite floor,
Over the boulders and pebbles, chanting its dryad lore,
Over its stony pathway, sang a brook with silver tones,—
God! what a stranger stream is roaring over Manhattan's stones!

Dazzled by phantom fortune, I followed that brook adown,
Where its turbid waters tarried a space by the teeming town,
And on through the dreary lowlands, which deeper and darker
flow,

Till its dusky waves were lighted with the city's lurid glow,
Till the crystal stream was swallowed in a sluggish, polluted tide,
Till the echoing forest voices in the babel-clamor died,
Till swept like a leaf on the torrent I was whelmed where the
breakers beat,

Where the seething, surging human tide flows over Manhattan's
street.

I tread the stones of Manhattan, the stones that are hard to my
feet,—

As hard as the hearts around me, as hard as the faces I meet.
Hot is their breath in summer, with fever of selfish greed,
Cold is their touch in winter, as hearts to the hand of need.

My heel strikes fire from the flint, but the spark is dead ere it burns.
Strikes fire in my angry striding, but is bruised by the stone it spurns:
And echo scorns with a stony voice the cry of a soul's despair
Breathed out on the thunderous throbbings of the city's desert air.

Oh! faithless stones of Manhattan, that tempted my boyish feet
Away from the clover-meadow, from the wind-woven waves of wheat,
I thought ye a golden highway; I find ye the path of shame.
Where souls are sold for silver, and gold is the price of fame!
But my weary feet must tread yet, as slaves on the quarry floor,
And my aching brain must suffer your pitiless uproar,
Till the raving tide shall sweep above, and careless feet shall tread
On the fatal stones of Manhattan, over my dreamless bed!

SONNET.

BY LOUIS BELROSE, JR.

"Before, a joy proposed; behind, a dream!"

SHAKESPEARE, SONNET 129.

Oh! the strong, strange emotion, bitter-sweet,
That fills my weary bosom as I ride
Along these lanes, and note on every side
The woods and fields that knew my childish feet.

Men stare at me, but all the ripening wheat
• Bows and is glad; the brook by which I sighed
• Told an old tale and laughed; and, dignified,
My friends the trees stretch out their arms to greet.

Ah, yes, 'twas there while resting from my play
I dreamt of future years, that used to seem
So full of promise and so far away.

Poor child! they come and go, but none redeem
The worthless pledge; they pass, and each new day
But dims the memory of that fond dream.

WALLINGFORD, DELAWARE CO., PA., July, 1875.

CORRESPONDENCE.

WHAT WAS MATRIARCHY?

To the Editor of THE OPEN COURT:—

MRS. M. J. GAGE presents an idea of the matriarchate widely different from that which I had gained from such reading and thinking as I have devoted to the subject, and it is important to determine which view is the correct one. I have remarked that it "was, so far as can be determined, simply a prostitution in which the temper of the people did not require the mother to conceal the evidence of her position. * * * Female infanticide was practiced, and so was established a system which has its legitimate successor in the prostitution of modern ages."* On this Mrs. Gage observes † "All this is a mistake. Matriarchy was the first step outside of promiscuity; it was the very foundation of the family. Wilkin shows that upon the relation between the mother and child the remotest conception of the family was based." She then cited examples of the exclusion of the father from the family relation in various primitive and some recent races; and the Celtic cult of god and goddess, which were not husband and wife, but mother and son. She also says that under primitive matriarchy "the father was a wanderer and held in no esteem." Finally she believes female infanticide, both for economic and religious reasons, prostitution, compulsory marriages, and the sacrifice of animals, etc., to have been all due to the ascendancy of man in the family or the

* THE OPEN COURT, 1888, p. 1388.

† L. C., 1889, p. 1481.

patriarchate, acquired later in history, and continued to the present day. These statements of Mrs. Gage constitute a terrible arraignment of the male sex, and could they be supported, would go far to justify the *Matriolatry* of which her paragraphs are redolent. If she is right, we men must acknowledge our base origin, and join her in her worship.

There are two ways of approaching the subject; one through the materials of history; the other by the exercise of our rational powers. History of those remote ages is not very clear, and the exact nature of the morality of those times is not easily discoverable. I shall however return to this source of information, but first let us exercise a little common sense.

It is generally supposed that the reason why descent was originally traced through the mother, was because the personality of the father could not be definitely ascertained. This would follow from the ignorance of the mother herself, or the uncertainty attaching to her statements on the subject. There is no other conceivable reason for such a state of affairs, and it is the more probable, if "the father was a wanderer and held in no esteem." Under such circumstances variable paternity would be inevitable; and to this day it is the wandering lives of many men which constitute the insoluble backbone of prostitution. One cannot say correctly that such mothers as these with their children constituted a "family" in the technical sense. Such women with children would necessarily have a residence more fixed than the unencumbered man, so that women became mistresses of such homes as they were, and this is perhaps what the matriarchate amounted to.

Let us however turn to McLennan's "Primitive Marriage," a standard work, to which I was referred by Dr. E. B. Tylor for information on this subject. Dr. McLennan says, p. 124: "The blood ties through females being obvious and indisputable, the idea of blood-relationship as soon as it was formed, must have begun to develop, however slowly, into a system embracing them. What further development this idea might have,—whether it would simultaneously have a development in the direction of kinship through males,—must have depended on the circumstances connected with paternity. If the paternity of a child were usually as indisputable as the maternity, we might expect to find kinship through males acknowledged soon after kinship through females. * * * And fathers must usually be known before men will think of relationship through fathers, indeed before the idea of a father can be formed. The requisite degree of certainty can be had only when the mother is appropriated to a particular man as his wife, and when women thus appropriated are usually found faithful to their lords." P. 131: "Before the invention of the arts, and the formation of provident habits the struggle for existence must often have become very serious. The instincts of self-preservation therefore must have frequently predominated and shaped the features of society freely as if the unselfish affections had no place in human nature. * * * Foremost among the results of this early struggle for food and security must have been an effect upon the balance of the sexes. As braves and hunters were required and valued, it would be the interest of every horde to rear, when possible, its healthy male children. It would be less its interest to rear females, as they would be less capable of self-support, and of contributing by their exertions to the common good. In this lies the only explanation which can be accepted of the origin of those systems of female infanticide still existing, the discovery of which from time to time, in out-of-the-way places, so shocks our humanity. It is of no consequence by what theories the races who practice infanticide now defend the practice. There can be no doubt that its origin is everywhere referable to that early time of struggle and necessity which we have been contemplating." Mr. McLennan then goes on to show how that the deficiency of women would involve, first, promiscuity, and later, polyandry, in which the determination of male parentage was mostly impossible. Thus the ma-

trichy represents a primitive stage of society, and one which did not differ essentially from the modern system of prostitution. It gave way to monogamy and polygamy as men began to value women, and desired to protect and support their children.

E. D. COPE.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXII.—Continued.

"I too am little better than an exorcist," resumed the Professor, in answer to the remark of the Princess. "It would be a bad recommendation for me if your Highness were to judge of my work by what I have achieved here in stirring up the old dust. One is delighted and disappointed, like a child. It is fortunate that fate does not often tease us book-writers with such tricks; what we do for the benefit of others does not depend upon accidental discoveries."

"I can form an idea of the seriousness of the work which I do not see," exclaimed the Princess. "Your kindness has opened at least an aperture through which I can look into the workshop of creative minds. I can understand that the labor of learned men must have an irresistible attraction for those who belong to that silent community. I envy the women whose happiness it is to live their whole lives within the sphere of such occupations."

"We are bold conquerors at the writing-table," answered the Professor; "but the incongruity between our inward freedom and outward helplessness is often felt by the conqueror and those about him. They who really pass their lives with us may easily fathom us, and can with difficulty bear our one-sidedness. For, your Highness, learned men themselves are like the books they write. In general we are badly prepared for the whirl of business, and sometimes helpless in the manifold activity of our time. We are true friends to men in those hours in which they seek new strength for the struggle of life, but in the struggle itself we are generally unskilful assistants."

"Are you thinking of yourself in speaking thus?" asked the Princess, quickly.

"I had in my mind a picture of the combined traits of many of my fellow-workers, but if your Highness inquires about myself, I also am in this respect a regular man of learning. For I have often had opportunity of remarking how imperfect is my judgment on all questions in which my learning or my moral feeling do not give me assurance."

"I do not like that, Mr. Werner," cried the Princess, leaning gravely back in her arm-chair. "My fancy took its highest flight; I sat as sovereign of the world, prepared to make my people happy, and I made you my minister of state."

"Your confidence gives me pleasure," replied the

* Translation copyrighted.

Professor; "but if your Highness should ever be in the position to seek for an assistant in government, I could not accept this dignity with a good conscience unless your Highness's subjects had all been passed through the bookbinder's press, and wore little coats of pasteboard, and had on their backs labels that told the contents of each."

The Princess laughed, but her eyes rested with deep feeling on the honest countenance of the man. She rose and approached him.

"You are always true, open, and high-minded."

"Thanks for your judgment," replied the Professor, much pleased. "Even your Highness treats me like a spirit that dwells in a book; you praise me as openly as if I did not understand the words that you speak. I beg permission to convey to your Highness my feelings also in a review."

"What I am like, I do not wish to hear from you," exclaimed the Princess; "for you would, in spite of the harmlessness which you boast of, end by reading me as plainly as if I had a morocco-covered back and gilt edges. But I am serious when I praise you. Yes, Mr. Werner, since you have been with us I have attained to a better understanding of the value of life. You do not know what an advantage it is for me to have intercourse with a mind which, undisturbed by the little trifles around it, only serves its high goddess of Truth. The turmoil of daily life bears hard upon us, and perplexes us; those by whom I am surrounded, even the best of them, all think and care about themselves, and make convenient compacts between their feeling of duty and their egotism. But in you I perceive unselfishness and the incessant devotion of yourself to the highest labor of man. There is something great and lofty in this that overpowers me with admiration. I feel the worth of such an existence, like a new light that penetrates my soul. Never have I known any one about me so inspired with heaven in his breast. That is my review of you, Professor Werner; it is, perhaps, not well written, but it comes from my heart."

The eyes of the learned man shone as he looked at the enthusiastic countenance of the princely child, but he was silent. There was a long pause. The Princess turned away, and bent over her books. At last she began, with gentle voice:

"You are going to your daily work, I will do so also. Before you leave me, I beg of you to be my instructor: I have marked a place in the work on art that you had the kindness to bring from the library, which I could not quite understand."

The Professor took the open book from her hand, and laughed.

"This is the theory of quite a different art; it is not the right book."

The Princess read, "How to make blanc-mange." She opened the title page: "Common-sense cook-book of an old Nuremberg cook." She turned the book round with astonishment; it was the same simple binding.

"How does this come here?" she exclaimed, with vexation, and rang for her maid.

"No one has been here," said the latter, "except the Princess, a short time ago."

"Ah!" exclaimed the Princess, depressed. "Then there is no hope. We are now under the dominion of a mischievous spirit, and must wait till our book returns. Farewell, Mr. Werner; if the mischievous spirit restores me the book I shall call you back."

When the Professor had taken leave, the maid came back alarmed and brought the lost Archæology in a sad condition. The book was in the cage of the monkey. Giocco had studied it industriously, and was furious when the volume was taken away from him.

At the same hour the Chamberlain was standing before the Sovereign.

"Your friends from the University have domesticated themselves with us; I take for granted that you have done your best to make our city agreeable to them."

"Professor Werner appears well contented," replied the Chamberlain, with reserve.

"Has your sister Malwine made the acquaintance of the Professor's wife?"

"Unfortunately my sister has been obliged to nurse a sick aunt in the country."

"That is a pity," replied the Sovereign; "she may have reason to regret this accident. Some time ago you expressed your opinion that some practical occupation would be beneficial to the Hereditary Prince; I have considered the matter. It will be necessary to find the means of a temporary residence in the district of Rossau. The old forester's lodge will not be ill adapted to it. I have determined by additional building to change the house into a habitable residence. The Hereditary Prince must be on the spot to plan the building according to his wishes, and you will accompany him. The architect has orders to draw the plans according to the Prince's directions. I only wish to speak to him about the proposed estimate. Meanwhile the Hereditary Prince will occupy the rooms that are reserved for me in the forester's lodge. But as the building will not take up his whole time, he may employ his leisure in obtaining an insight into our agricultural methods, at the farm of the adjoining proprietor. He should learn about field-work and book-keeping. The year is already far advanced, which makes a speedy departure advisable. I hope

this arrangement will meet a wish that you have long entertained. The beautiful country and the quiet wood will be a refreshment to you after your winter-work."

The Chamberlain bowed dismayed before his master, who so graciously pronounced his banishment from Court. He hastened to the Hereditary Prince and related the bad tidings.

"It is exile!" he exclaimed, beside himself.

"Make your preparations speedily," replied the Hereditary Prince quietly. "I am prepared to go at once."

The Hereditary Prince went to his father.

"I will do what you command, and make every effort to please you. If you, as a father, consider this residence in a distant place useful, I feel that you understand better than I what will be beneficial for my future. But," he continued, with hesitation, "I cannot go from here without making a request which I have much at heart."

"Speak, Benno," said the Sovereign, graciously.

"I beg of you to permit the Professor and his wife to depart as quickly as possible from the neighborhood of the Court."

"Why so?" asked the Sovereign sharply.

"Their residence here is hurtful to Mrs. Werner. Her reputation is endangered by the unusual position in which she is placed. I owe him and her great gratitude; their happiness is a matter of concern to me, and I am tormented by the thought that their stay in our parts threatens to disturb the peace of their life."

"And why does your gratitude fear a disturbance of the happiness that is so dear to you?" asked the Sovereign.

"It is said that the Pavillion is a fateful residence for an honorable woman," replied the Hereditary Prince, decidedly.

"If what you call honor is endangered by her dwelling there, then that virtue is easily lost," said the Sovereign, bitterly.

"It is not the dwelling alone," continued the Hereditary Prince; "the ladies of the Court have been quite reserved in their conduct toward her; she is ill spoken of: gossip and calumny are busy in fabricating a false representation of her innocent life."

"I hear with astonishment," said the Sovereign, "the lively interest you take in the stranger; yet, if I am rightly informed, you yourself during this time have shown her little chivalrous attention."

"I have not done so," exclaimed the Hereditary Prince, "because I have felt myself bound to avoid, at least so far as I was concerned, any conduct that might injure her. I saw the jeering looks of our gentlemen when she arrived; I heard their derogatory words about the new beauty who was shut up in that house,

and my heart beat with shame and anger. Therefore I have painfully controlled myself; I have feigned indifference before those about me, and I have been cold in my demeanor towards her; but, my father, it has been a hard task to me, and I have felt deep and bitter anxiety in the past few weeks; for the happiest hours of my life at college were passed in her society."

The Sovereign had turned away; he now showed his son a smiling countenance.

"So that was the reason of your reserve. I had forgotten that you had reached the age of tender susceptibility and were inclined to expend more emotion and sentiment on your relations to women than is good for you. Yet I could envy you this. Unfortunately, life does not long retain its sensitive feelings." He approached the Prince, and continued, good-humoredly: "I do not deny, Benno, that in your interest I regarded the arrival of our visitors differently. For a prince of your nature there is perhaps nothing so fraught with culture as the tender feeling for a woman who makes no demands on the external life of her friend, and yet gives him all the charm of an intimate union of soul. Love affairs with ladies of the Court or with assuming intriguants would be dangerous for you; you must be on your guard that the woman to whom you devote yourself will not trifle with you and selfishly make use of you for her own ends. From all that I knew, your connection with the lady in the Pavilion was just what would be advantageous for your future life. From reasons of which I have full appreciation, you have avoided accepting this idyllic relation. You yourself have not chosen what I, with the best intentions, prepared for you; it seems to me, therefore, that you have lost the right in this affair to express any wishes whatever."

"Father," explained the Hereditary Prince, horrified, and wringing his hands, "your saying this to me is indeed unkind. I had a dark foreboding that the invitation to them had some secret object in view. I have struggled with this suspicion, and blamed myself for it; now I am dismayed with the thought that I myself am the innocent cause of this misfortune to these good people. Your words give me the right to repeat my request: let them go as soon as possible, or you will make your son miserable."

"I perceive an entirely new phase of your character," replied the Sovereign; "and I am thankful to you for the insight that you have at last accorded me into your silent nature. You are either a fantastical dreamer, or you have a talent for diplomacy that I have never attributed to you."

"I have never been other than candid to you," exclaimed the Hereditary Prince.

"Shall the lady return to her home at Bielstein to be saved?" asked the Sovereign mockingly.

"No," replied the Hereditary Prince, in a low tone.

"Your demand scarcely deserves an answer," continued the father. "The strangers have been called here for a certain time. The husband is not in my service. I am neither in a position to send them away, as they have given me no reason for dissatisfaction, nor to keep them here against their will."

"Forgive me, my father," exclaimed the Hereditary Prince. "You have yourself, by the gracious attention which you daily show to the wife, by your civil gifts and frequent visits, occasioned the Court to think that you take a special personal interest in her."

"Is the Court so busy in reporting to you what I, through the unbecoming conduct of others, have thought fit to do?" asked the Sovereign.

"Little is reported to me of what those about us say, and be assured that I do not lend a ready ear to their conjectures; but it is inevitable that I sometimes must hear what occupies them all and makes them all indignant. They venture to maintain even, that every one who does not show her attention is in disgrace with you; and they think that they show special firmness of character and respectability in refusing to be civil to her. You, as well as she, are threatened with calumny. Forgive me, my father, for being this frank. You yourself have by your favor brought the lady into this dangerous position, and therefore it lies with you to deliver her from it."

"The Court always becomes virtuous when its master selects for distinction a lady who does not belong to their circle; and you will soon learn the value of such strict morals," replied the Sovereign. "It must be a strong sentiment, Benno, which drives your timid nature to the utmost limits of the freedom of speech that is allowable from a son to a father."

The pale face of the Hereditary Prince colored.

"Yes, my father," he cried, "hear what to every other ear will remain a secret; I love that lady with ferment and devoted heart. I would with pleasure make the greatest sacrifice in my power for her. I have felt the power that the beauty and innocence of a woman can exercise on a man. More than once have I strengthened myself by contact with her pure spirit. I was happy when near her, and unhappy when I could not look into her eyes. For a whole year I have thought in secret of her, and in this sorrowful feeling I have grown to be a man. That I have now courage to speak thus to you, I owe to the influence which she has exercised upon me. I know, my father, how unhappy such a passion makes one; I know the misery of being for ever deprived of the woman one loves. The thought of the peace of her pure soul alone has sustained me in hours of bitterness. Now you know all. I have confided my secret to you and I beg of you, my Sovereign and father, to receive

this confidence with indulgence. If you have hitherto cared for my welfare, now is the time when you can show me the highest proof of our sincerity. Honor the woman who is loved by your unhappy son."

The countenance of the Sovereign had changed while his son was speaking, and the latter was terrified at its menacing expression.

"Seek, for your tale, the ear of some knight-errant who eagerly drinks the water into which a tear of his lady-love has dropped."

"Yes, I seek your knightly help, my liege and Sovereign," cried the Hereditary Prince, beside himself. "I conjure you, do not let me implore you in vain. I call upon you, as the head of our illustrious house, and as a member of the order whose device we both wear, to do a service to me and for her. Do not refuse her your support in her danger."

"We are not attending a mediæval ceremony," replied the Sovereign, coldly, "and your speech does not accord with the tone of practical life. I have not desired your confidence—you have thrust it upon me in too bold a manner. Do not wonder that your father is angry with your presumptuous speech, and that your Sovereign dismisses you with displeasure."

The Hereditary Prince turned pale and stepped back.

"The anger of my father and the displeasure of my Sovereign are misfortunes which I feel deeply; but still more fearful to me is the thought, that here at Court an injury is done to an innocent person—an injury in which I must have a share. However heavily your anger may fall upon me, yet I must tell you that you have exposed the lady to misrepresentation, and as long as I stand before you I will repeat it, and not desist from my request to remove her from here, for the sake of her honor and ours."

"As your words flutter ceaselessly about the same empty phantom," replied the Sovereign, "it is time to put an end to this conversation. You will depart at once, and leave it to time to enable me to forget, if I ever can do so, what I have heard from you to-day. Till then you may reflect in solitude on your folly, in wishing to play the part of guardian to strangers who are quite in a position to take care of themselves."

The Hereditary Prince bowed.

"Has my most Sovereign liege any commands for me?" he asked, with trembling lips.

The Sovereign replied sullenly:

"It only remains to you now to excite the ill-will of the strangers against your father."

"Your Highness knows that such conduct would not become me."

The Sovereign waved his hand, and his son departed with a silent bow.

(To be continued.)

BOOK REVIEWS.

LA MORALE DANS LE DRAME, L'EPOPEE, ET LE ROMAN. *Lucien Arréat*. Paris: Felix Alcan.

"The object of this work," says M. Arréat, "is to seek, in all literatures, the evidences of moral evolution. It enters thus, concurrently, upon the province of history and psychology: it is a critical dissertation, historical or literary, as you may please to call it." The author neither accepts the doctrines of the intuitionist school, that moral ideas are *a priori* cognitions, nor does he proceed from utilitarian principles, which construct ethics upon the criteria of pleasure or pain. Modern moralists, differing from Kant on the one hand and from the hedonists on the other, do not separate conscience from its proper accompanying phenomena, duty from its object; the purely subjective world of duty is not opposed to the sense-world of desires. They think, that a person, is "obliged" by that which he desires, conceives as an end, and that the bond of obligation is wrought in the mind by the combined action of sensibility and reason, whatever may be the content of happiness or of duty.

This constant connection of duty and obligation is indicated by M. Arréat, in his analysis and exposition of the various states of morality traceable in history and literature. Our author begins with an examination of the sources of moral activity, and of the emotional nature of man. The genesis of positive duties in the epic and drama of early times is depicted. The moral obligation, the moral conflict in the literature of every epoch; punishment and remorse, in tragedy and tradition; the principle of retribution, in the drama:—all are illustrated in the order of their development. The chapters on "The Mechanism of the Will" and on "Pathological Heroes" are to be especially recommended. The latter is a subject quite new in literary criticism, and the value of M. Arréat's discussion will be enhanced by its conformity with the recent investigations of French experimental psychology. Literary criticism seldom seeks the assistance of science, and we may mark this departure as laudable in the author and indicative of more liberal tendency in a popular department of human opinion. *μικρο*.

WINDFALLS.—SOBER THOUGHTS ON STAPLE THEMES. *Richard Randolph*. Philadelphia: Henry Longstreth, 740 Sansom Street. Revised editions.

In "A Salutation" to the former of these two volumes Friend Richard Randolph writes:

"And if we be connected
On the internal ground,
With joy are we affected
When Outward links are found."

In the inward aspiration after universal truth, and in the effort to realize that unity in actual life and philosophical thought which the formal constitution of the mind teaches us exists, the reader will find the kernel of this little series of disquisitions. "The doctrine of a pervading unity in nature, like every other principle in truth," says the author, "may be said to be an intuitive perception of the healthy human soul." Proceeding from this statement, Mr. Randolph selects mathematics as typical of universal science; here are presented principles of universal applicability and certainty, and if there be a universal thought, the object of individual thinking, then by virtue of the applicability of these same laws of perception and thought to the development of other branches of knowledge, the objective reality of all must be equally established. "The whole creation will thus be intelligibly presented to our imagination as a continuous temple of truth and beauty, albeit more or less vaguely, while the lingering veil of moral evil shall at all obscure the perfect designs of the divine Creator, and retard the full appreciation of the willing worshiper." The essays following, of which we may enumerate "The House of Bondage," "The Land of Promise," "The Place of Fiction,"

"Hidden Life," "Conversation and Education," are full of spiritual vigor and earnest thought.

In the collection "Sober Thoughts on Staple Themes," the same truth-aspiring spirit plays, the same effort to realize the ideals of Brotherly Love is present. "Truth is the law as well as the lawful object of life, and doctrine is valuable only as a reflection of truth." *μικρο*.

The Jacqueminot Roses, which come to us in the March number of the *Art Amateur* are glowing in color and blooming enough to give promise of a beautiful summer, instead of a chill and tardy spring.

"My Note Book" is full of accounts of auction sales, picture exhibitions, and curious anecdotes about connoisseurs. A large portion of the number is devoted to the accounts of exhibitions including those of water colors, of the Pennsylvania Academy, Brooklyn Art Club, and many others.

The most important article is a biographical and critical sketch of Alexander Cabanel, the late French artist. He was widely known as the decorator of the Tuileries, and also by his portraits. Many Americans were among his letters. The critic sums up his life thus:

"In Cabanel's artistic life there were three well marked periods: those of the student, of the artist, of the teacher and mechanical painter; and the second was the shortest and the least productive." Some reproductions of his crayon studies well illustrate the latter part of his career.

China painters may be interested in the account of "A New Portable Gas Kiln," invented by a woman, to be heated by common illuminating gas, which will "make it possible for china painters to fire their work at home."

A well illustrated article describes the methods of pen-drawing for the photo-engraving process.

Useful hints are given to Amateur photographers.

The most novel thing in the number, however, is "The Bedroom at Bedtime" which describes an old French bedroom with "warming pan" and "post warmer." On the whole, this is an unusually interesting number of this popular periodical. E. D. C.

NOTES.

On December 8, 1888, Col. Garrick Mallery held an address, as retiring president of the Philosophical Society of Washington, upon "Philosophy and Specialties," now published in the Bulletin series of that society. We like the spirit and method of Col. Mallery's address. The extent and significance of organized scientific work in the United States, is reviewed with critical strokes. Our author finds an injurious predominance given to specialistic disquisitions in the proceedings of most of our scientific associations. Their true office should be to harmonize, to correlate, and to put in an intelligible, philosophic form the acquisitions their several departments have made.

We have received the following letters, which for lack of space have been crowded from the columns of the present number: from Mr. Redway and Dr. Gould upon "Dreams, Sleep, and Consciousness"; from A. M. G. in criticism of Mr. Francis Russell's communication, "Postulates and Axioms;" and from Wheelbarrow, in answer to the strictures of various correspondents.

A contribution from the pen of M. Alfred Binet will appear in our next issue. The subject, one of transcendent interest to all thinking persons, is "Sensation and the Outer World." Many novel points are touched, and the subject treated in M. Binet's usual clear and facile manner.

Walter Pater, author of "Marius the Epicurean," will contribute the End Paper to *Scribner's* for April, analyzing a group of "Shakspeare's English Kings" from a novel point of view.

The Open Court Clubbing Rates.

The following rates are offered to all who wish to subscribe for THE OPEN COURT and any one of the magazines in the list subjoined. If more than one be desired, they may be obtained through our office at the price stated in the first column, allowing a discount of 10 per cent on all orders amounting to \$10.00 and over. Each periodical sent with THE OPEN COURT for the price stated in the second column. Money must accompany all orders.

"The Week, one of the ablest papers on the continent."—*Descriptive America.*

ENLARGED AND IMPROVED.

"THE WEEK,"

A Canadian Journal of Politics, Literature, Science, and Art.

Published every Friday. \$3.00 per year.
\$1.00 for Four Months.

THE WEEK has entered on its SIXTH year of publication, greatly enlarged and improved in every respect, rendering it still more worthy the cordial support of every one interested in the maintenance of a first-class literary journal.

The independence in politics and criticism which has characterized THE WEEK ever since its first issue will be rigidly maintained; and unceasing efforts will be made to improve its literary character and increase its attractiveness as a journal for the cultured home. Many new and able writers are now, or have promised to become, contributors to its columns, and the constant aim of the Publisher will be to make THE WEEK fully equal to the best literary journals in Britain and the United States.

As heretofore, PROF. GOLDWIN SMITH will, from time to time, contribute articles. London, Paris, Washington, and Montreal letters from accomplished correspondents will appear at regular intervals. Special Ottawa Letters will appear during the sessions of Parliament.

THE WEEK in its enlarged form will be the same size as "Harper's Weekly," and the largest paper of its class on the continent.

THE

Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects:

1. *The Psychology of the Cell—Introductory.*
2. *The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.*
3. *The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition; Predatory Habits of Certain Animalcula.*
4. *Colonies of Unicellular Organisms.*
5. *Fecundation of Proto-Organisms.*
6. *Fecundation of Higher Animals and Plants.*
7. *The Physiological Function of the Nucleus.*
8. *Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.*

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instance, apart from the author's original investigations, the researches of Balbiani, Claparède and Lachmann, Maupas, Ribot, Haeckel, Engelmann, Espinas, Pouchet, Weber, Pfeffer, Kni, Dujardin, Gruber, Nussbaum, Bütschli, Lieberkühn.

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Mr. G. F. Romanes, that the first appearance of the various psychical and intellectual faculties is assignable to different stages in the scale of zoological development.

16 mo, 135 pages. Cloth, 75 Cts, Paper, 50 Cts.

Review of Recent Work of THE OPEN COURT. PSYCHOLOGY AND BIOLOGY.

EXPERIMENTAL PSYCHOLOGY IN FRANCE. ALFRED
BINET.....No. 74.
DREAM, SLEEP, AND CONSCIOUSNESS. DR. GEORGE
M. GOULD.....Nos. 74 and 75.

BODY AND MIND; OR THE DATA OF MORAL PHYSIO-
LOGY. FELIX L. OSWALD, M. D.....Nos. 72, 75, 78.

M. BINET'S entertaining sketch of the state of Experimental psychology in France is the only direct and convenient source from which the reader can obtain a comprehensive idea of the contributions the author's country is making to this branch of mental science. The work of psychologists in France is distinguished by its almost exclusive bearing upon the pathological phases of psychological phenomena. The greatest successes of MM. Ribot, Richet, Charcot, and others, have been in treating the *diseases of the mind*.

PHILOSOPHY.

SENSATION AND MEMORY. EDITOR.....No. 74.
COGNITION, KNOWLEDGE, AND TRUTH. EDITOR.....No. 76.
MONISM AS THE FORMAL PRINCIPLE OF COGNITION..No. 78.

In the two first discussions, the conditions and processes by which we start from the bare excitations of the sensory world and attain to knowledge, are unfolded. Sensation is the primal condition of all knowledge; the products of sensation are preserved and transmitted as psychological forms; the psychological law of this retentive power is memory, from which source are evolved the different branches and varied forms of human thought.

The last essay of this series shows that the constitution of the human mind naturally predisposes man for Monism. The unitary conception which the intellect seeks to formulate respecting all things brought within its range, is the inward proof offered to us of the correctness of the monistic philosophy. Monism is thus a subjective principle, informing us how to unify knowledge and make it potent.

AXIOMS THE BASIS OF MATHEMATICS. DR. EDWARD
BROOKS.....No. 76.
THE OLD AND THE NEW MATHEMATICS. EDITOR.No. 77.
A FLAW IN THE FOUNDATION OF GEOMETRY.
HERMANN GRASSMANN.....No. 77.

In No. 76, Dr. Edward Brooks of Philadelphia, takes exception to an editorial thesis that "mathematics is unfortunately constructed on axioms." To Dr. Brooks no other way of construction is possible. There exist "*first truths or axioms* which the mind has power to cognize," which are incapable of proof, and which every system, even though nominally rejecting them, nevertheless tacitly employs. The editorial answer to Dr. Brooks, in No. 77,

is based upon the principles unfolded in the series of disquisitions on "Form and Formal Thought," in Nos. 64, 66, 67, and 69. Axioms so called, are the *result* of reasoning, and not the basis of it; the laws of formal thought determine the correctness and necessity of a proposition; conformity, in every instance, with these laws alone makes a truth universal. The relations of actual, material space have thus universally coincided with the laws of a formal system of third degree, and hence the rigidity and finality of those relations. In the same number, a translation from Hermann Grassmann's "Theory of Extension" is presented; it contains the fundamental points of departure of the new geometry from the old. No English version of this epoch-making work exists. The discussion will greatly interest those who have given their attention to the philosophy of mathematics.

SOCIOLOGY AND ECONOMICS.

HENRY GEORGE AND LAND TAXATION. WHEEL-
BARROW.....No. 73.
SYMPTOMS OF SOCIAL DEGENERACY. MONCURE D.
CONWAY.....No. 74.
MAKING BREAD DEAR. WHEELBARROW.....No. 78.

WHEELBARROW opposes Mr. Henry George and the doctrine of Land Taxation with proper regard for the truth contained in the distinguished economist's theories. Objection is mainly taken to the universal curative power that the advocates of Land Taxation claim for their remedy. In man's obedience to moral laws Wheelbarrow finds the only magic wherewith to change the face of society.

Much criticism has been elicited by the bare mention of Mr. George's economical doctrines—indubitable testimony of their popularity and strength. Letters have appeared in No. 79 and others will follow.

"Symptoms of Social Degeneracy," Mr. Moncure D. Conway finds to be not unrequited even in American civilization. We are prone to emphasize the survivals of barbaric institutions in effete Europe, while overlooking the excrescences of our own body politic. Lynch-Law, literary piracy, corruption in administrative circles, are signs of the decay of an ethical system and the theology that protects it. Worst of all, these evils are not unaccompanied with attempts at palliation.

HISTORICAL AND CRITICAL.

THE STUDY OF SANSKRIT. H. OLDENBERG.....No. 79.
ASPECTS, CHRISTIAN AND HUMAN. WILLIAM R.
THAYER.....No. 79.

The study of Sanskrit, upon which a series of articles commences with No. 79, is a department of historical research comparatively new. Prof. Oldenberg, one of the most eminent Sanskrit scholars of the present day, tells us in popular language the story of the origin, growth, and present state of Sanskrit research. This department of philological and historical inquiry has done more than any other towards the true interpretation of the early history, civilization, and religion of the Aryan peoples. Within less than a century results have been attained, of which former generations would not have presumed to think. The articles have been translated from the German.

Under the title of "Aspects, Christian and Human," Mr. W. R. Thayer maintains in lucid and earnest language that the influences and forces to which the great changes wrought in modern society must be attributed, have not proceeded from sources essentially Christian. These advances are distinctly secular and human in character. "Not the preacher, but the poet; not the politician, but the untrammelled agitator, men whose tongues were free, and whose hearts were fearless, have been the heralds and champions of better things."

ETHICAL EVOLUTION.

BY E. D. COPE, PH.D.

THE original propounders of the utilitarian theory of morals, did not probably anticipate the substantiation of their position which has resulted from the thought of the present century. The discovery of the law of the evolution of man physically and mentally, and of the consequent evolution of society, has placed the utilitarian doctrine on a foundation which will remain. It is, however, a question of importance whether this theory embraces the *whole* truth or whether it describes a part only of the law of human ethical progress. To examine this question is an object of the present enquiry.

It is impossible to doubt that man in society acquired the habit and learned the principles of just treatment of his fellows, by the mutual pressure which every man has brought to bear on every other man, in asserting and enforcing his own rights. He did not learn it immediately, nor have all men learned it yet, but the educating forces have been and still are at work towards this end. That ethical conduct is an outgrowth of natural mental constitution can be doubted by no one who has observed men. It differs in children as compared with adults, in women as compared with men, and among men as compared with each other. And ethical qualities are so distributed in the different types of mankind as to display clearly the causes of those differences. The ethical merits and defects of children are due to immaturity and ignorance; those of women to the greater strength of their emotional nature; and in men to their superior physical and rational force. Physical necessities and the characteristics of the environment have impressed themselves on races, families, and individuals, so that, given certain conditions, one knows what to expect of men in an ethical direction. It is the innumerable facts of this kind that have led to an examination into the history of the development of the moral nature in man, and have led to its association with the theory of the physical evolution of man, now so clearly taught by the sciences of biology.

The moral sense is well known to psychologists to be a complex faculty. It involves first the knowledge of ethical truth, and second the "sense of right," or the sentiment or affection of the love of ethical right.

The knowledge of right is an intellectual faculty and is an expression of the strength of the rational powers. Thus is explained the superiority of the more rational nations and individuals in this direction. But without the disposition to live up to this knowledge it avails little. Rationality is not always able to decide whether the law of right is most profitable or not. There are persons who assert that honesty is *not* the best policy. To judge by men's acts it may be supposed that such persons are not rare. Indeed, in a large portion of the human race the rational faculty itself is yet imperfectly developed. It is not uncommon to see persons who in one or more respects do not even know what is right. A large and full rationality, however, furnishes not only a knowledge of right but furnishes the affectional nature with reasons why it is best to practice right, even from an egotistic point of view. It is said that the utilitarian doctrine makes right and right identical. And so they are in the long run. A strong man may defy a weaker, or even two such, but the limit of his strength is soon reached, and numbers will overcome him. It is the ultimate fate of the malefactor to be overcome by numbers; and for this reason prudence teaches that honesty is the best policy after all. But there is another important egoistic reason for ethical conduct. The ethical life expresses the highest development of humanity; involving clearness of intellect, and benevolence of heart, with a self-control which is the expression of will. This combination of qualities represents the highest stage of human evolution, and is that which has the best chance of continuing. It is also the one which is the best worth preserving in another life, if a survival of the fittest control the admission, where fitness may be supposed to be a capacity for harmonious coëxistence with other minds.

From the altruistic side the motives for ethical life are direct. This part of human character is traceable to the sexual and maternal instincts and the affections which have grown out of them through long exercise. It is impossible to escape the conclusion that natural benevolence and generosity of character, and sympathy for other persons, have been derived from this source. This affectional quality of the mind has ever interacted with the rational in the production of motives of action in men. Each one has served as a

guide and stimulus to the other. With the increase of knowledge men's sympathies have grown broader; with increased strength of benevolence they have grown more regardless of egoistic motives of the material type. It cannot be truly said that altruistic motives are not at the same time egoistic, since there is a gratification experienced in the exercise of them. Whether all altruism is of egoistic origin remains to be seen. And on the other hand, altruism not regulated by judgment, may be immoral, as in some forms of charity, and some forms of sex relations.

A good many phrases have been borrowed from the vocabulary of physical evolution and applied in the field of human action without proper discrimination and with mischievous effect. Thus it was not seen at first that "the struggle for existence" among men is not merely a system of grab, and that the observance of human rights is not one of the conditions of success in it. It has been in some cases forgotten that the "survival of the fittest" is not the survival of the hardest hitter, or of the most successful embezzler. It has been still more frequently forgotten that "the line of least resistance" is very far from being the line of progress, in human affairs, and that in fact no great advance in some directions is possible among men, without considerable work in lines of strong resistance. It is in fact easier for men of limited moral capacities to go down, than up, a fact which might seem inconsistent with a theory of natural ethical evolution. Why it is not inconsistent I will proceed to show.

The effects of ethical degeneracy in a community are self-evident. With frequent dishonesty in business transactions, their freedom would be proportionally diminished, through the failure of credit and the burden of necessary safeguards. Without credit many enterprises that employ labor would come to a standstill, and many persons would be impoverished. Poverty would bring an increase of crimes against person and property, especially against those who profited by corrupt methods. Corruption in the administration of justice would be followed by the taking of private revenge for injuries. Social immorality would be followed by the same results by a shorter route. It is not difficult to perceive how a community might fall into chaos through moral degeneracy; indeed, history has witnessed such a process in various degrees of development, at different times, and in different countries. The last days of ancient Rome, and the French Revolution, may be cited in illustration of the effects on society of the persistent evil-doing of a larger or smaller part of its members.

The consequence of social chaos is misery, and the suffering, if not pushed to the destruction of the sufferer, has its usual good effect. The process of ethical development must be begun over again, and the build-

ing of character go on as before, and for the same reasons. Men will only tolerate a certain amount of pain, and when that limit is reached they take rational and serious methods to avoid it in future. This is the sure basis of natural ethical evolution. It is the general sentiment of the orthodox Christian world, that if the moral law of the old and new testaments should not be maintained to be of directly divine origin, the sanctions of morality would be lost, and that society would drift without sail or rudder. But apart from any question of the origin of ethical opinions, and of the text of the bible, it is certain that there is in the nature of things, a provision for the development of the moral part of man's mind, as of any other part of it. But we have seen what this natural system is. Like the struggle for existence in other respects, it is a system of mechanical severity. It is, indeed, that "mill of the Gods, which grinds exceeding fine." It is a Sheol of conflict and strife, and from which men of all nations and conditions may well desire to escape. This fact has been seen and foreseen by the wise of all ages, hence the earnestness of their ethical teachings, and the care with which their ethical laws and rules have been made and preserved.

The rational faculty finds its principal expression in the power of generalization; and the wider the grasp of facts in induction, or the more far-reaching the application of laws in deduction, the higher is the grade of the faculty. Wise men seeing and foreseeing the causes and effects of social conditions, have constructed systems of ethical conduct, and have pointed out the means of obeying them. This action of the wise towards their fellow men constitutes an element in human ethical evolution, in strong contrast to the *laissez faire* method of unassisted nature. It is a method of invitation as compared with one of compulsion. Coöperation with it on the part of men is infinitely economical of suffering. And the education to be derived from such sources is a protection against the evils of immorality to all who are influenced by it. Hence the incalculable value to mankind of such teachers as Buddha and Jesus Christ. The reasons which lie at the basis of their injunctions need not to have been perceived by their hearers; these have taken them largely on trust, and have clung to the promises of happiness which have followed them. The personal interest for the taught, expressed by the teacher, has won the hearts of the people, and the neglect of his lesser personal interests in the presence of the greater interests of all men, have convinced mankind of his sincerity. It is difficult to use the word selfishness in characterizing the lives of these great teachers of ethics. Although it was utility that was taught and sought, it was for the happiness of others. We have here an exhibition of the fruits of a development of

the affectional nature. But is this sufficient to account for the devotion of life-times and lives to such service?

The "strongest inducement" to altruistic conduct is love. The only perfect altruistic conduct is obtainable through love. The rational faculty fails to complete the work, and for this reason. Selfishness is essential to self-preservation in the world, and will be always. Egoism has constant exercise in its lower aspects, in the necessities of support and protection of our physical organism. As long as activity of the self-preservative faculties is stimulated, so long must temptations to dishonesty and egoism in various ways assail us. The rational faculty alone will not raise a sufficiently strong resistance to immorality in most people, if they think no practical harm will follow to themselves. A love will on the other hand act as a more powerful restraint. It is true that unaided by reason, love "loves its friends and hates its enemies," but rational love has a wider scope than one's friends only. But could the altruistic be evolved by natural causes to the degree that is expressed in the love of Jesus Christ to men?

The question of the existence or non-existence of a personal God cannot be gone into very fully here. Both materialists and idealists deny such existence; the former absolutely, the latter with or without qualification. The idealist, regarding thought as the most real thing, frequently sees in the last generalization of mind, a representative of the God of the ordinary man. But mind which consists of ratiocination only, is imperfect. Ratiocination in a being of great power does not imply goodness, for much evil might be inflicted by such a being were he not good, without harm to himself. Anthropomorphism is our natural guide to a personal God, and we cannot believe in universal mind, with essential parts of the human mind omitted. Paternal and maternal love are too strongly implanted in man, to permit him to believe in a deity without these qualities, if he believes in any. And I may say for myself that the nature of mind in all its relations to matter is such as to impress on me a belief in a wider distribution of mind than that which is limited by one little planet, a mere speck in the universe. So such mind must possess love, which with wide knowledge, and therefore power, is equivalent to goodness.

But the history of the world's life is a history of disasters mingled with pleasures, and of misery side by side with happiness. Wickedness prosperous for long periods, and goodness unrewarded, are common experiences. For such reasons as these, the existence of a personal deity has been denied. To the mind of the writer the facts indicate, not his non-existence, but his observance of a policy of non-interference. Such a policy might be construed as the indication of an evil rather than a good supreme being. But it is

evident on the other hand that such a policy is required, if terrestrial life is an education; and that such is the case is clearly taught by the doctrine of evolution. Without non-interference character cannot be developed, and evolution fails of its end. Idealism cannot explain this phenomenon. The problem of evil is absolutely inexplicable on a theory which excludes the existence of matter. The fact is that evolution is the conquest of matter by mind; it is the long process of learning how to bring matter into subserviency to the uses of mind. And as mind itself is a property of matter, evolution means an acquisition of the power of self-control, from the material as well as from the mental standpoint.

In this struggle of mind with matter, a supreme mind could not be an uninterested spectator. His own control of matter is more or less concerned in it, since we may regard every conquest of matter by mind as an addition to all mind. And as the lesser mind may be not unphilosophically supposed to have originated from a more primitive mind, the relation is much that of parent to child. Here is a basis for an affection such as the parent knows better than the child; and which often goes quite unknown and unrequited by the children of men, till in later years their own time has come to know what it is to be a parent. With the advent of the knowledge that we are coöperating with a general creation of mind and of happiness, and that our services are needed, we may begin to appreciate the interest which our lives must excite in that of the master workman, and with what pleasure our successes are perceived, and with what regrets our reverses. We may remember that the laws of matter, like those of logic, are immutable, and that no creator can violate them. A being of great experience may learn them, and control by obeying them, so that our own efforts in this direction are but the parallel in a small way, of those that have been undergone by the greater and wiser Mind. Material difficulties probably prevent us from knowing of more than a small part of the laws of psycho-physics, since telepathy and like phenomena are of such exceptional occurrence.

A view of the paternal relation of God kindles in the mind a sentiment of love, which forms an abiding element of character, and motive of action. The motive, so far as it is not due to expected rewards, is as nearly unselfish as any that is known to us. Its tendency is to induce in us altruistic sentiments, which have their result in corresponding actions. Such a motive is stronger than any judgment of the rational faculty by itself. It is, however, difficult to separate the two things in action, since much that we learn of the situation is due to the understanding. Is the love derived from natural sources? Metaphysics cannot yet answer this question.

PHENOMENA AND NOUMENA.

THE Hindoo Sages compared the world, as it appears to our senses, to a veil—the veil of Maya—which lies upon our eyes and thus shrouds the true aspect of things. And the same view, with comparatively slight modifications, is repeated in the philosophy of Plato. In a poetical passage in the "Republic," the Grecian philosopher compares human knowledge to the condition of men who sit in a cavern facing the wall opposite the entrance; being bound to the spot since birth by chains about their feet and neck. They cannot look around, they cannot see the persons and things passing by behind them, but they see their shadows on the wall opposite and imagine that these appearances are the real things.

The view that natural processes are not actual realities, but mere shadows of invisible existences behind them, has been revived often since, and must be considered even to-day as the philosophy of our time; and only gradually a new conception of the world is rising that looks upon natural processes, the phenomena so-called, as the positive facts of knowledge. The expression 'phenomenon' means 'appearance'; the word has been introduced and is now generally employed as a synonym of 'natural process' because the Hindoo conception of the sham-existence of reality was, some time ago, all but universal.

Immanuel Kant, in his Critique of Pure Reason, often speaks of "the thing of itself," and he says that we cannot have any positive knowledge of it. This was very discouraging, but it afforded those who paraded a Faust-like thirst for knowledge yet did not have the strength to devote a life of patient labor to earnest thought and research, an easy means of satisfying their yearning. Our knowledge is but relative, they said to themselves, and it is impossible to conceive the Absolute; the Absolute is the Unconditioned, and to our limited cognition it must be unknowable. If we could comprehend it, we would be omniscient like God, but as matters are, we are limited to the phenomenal world and must confess with Faust:

"That which one does not know, one needs to use;
And what one knows, one uses never."

If the absolute is incomprehensible, all our knowledge is vain, and worst of all, we can never hope to know anything about God and about our soul. Is not our soul our absolute self, the thing of itself which manifests itself in our existence? And is not God, the absolute of the universe, manifested in all the innumerable phenomena of nature? God and soul viewed from this standpoint, are unknowabilities.

Kant goes beyond this standpoint. The concepts 'Soul' and 'God,' as absolute existences or things of themselves, are paralogisms of pure reason. We have

arrived at these ideas by a fallacy. We experience in our consciousness a consecutive series of sensations or thoughts, but from this fact we cannot infer the existence of a 'consciousness without its contents' as a thing of itself. The world is an orderly arranged whole, but from this fact we cannot infer that a transcendent God is the author of this order. Kant adds in his Critique of Practical Reason, that although the ideas of God and soul are paralogisms, we should regulate our lives as if they existed; we should act as if we had a soul and as if a God existed—a just judge to reward the good and punish the evil.

These ideas of Kant have become popular and the unknowability of the thing of itself contributed greatly to the growth of agnostic thought in England.

The name 'agnostic' was invented by Professor Huxley for the avowed purpose of appeasing obtrusive persons, who bored him with questions as to his belief or disbelief in the existence of God, and the immortality of the soul. Prof. Huxley states the facts as follows:

"Some twenty years ago, or thereabouts,* I invented the word 'Agnostic' to denote people who, like myself, confess themselves to be hopelessly ignorant concerning a variety of matters, about which metaphysicians and theologians, both orthodox and heterodox, dogmatize with the utmost confidence; and it has been a source of some amusement to me to watch the gradual acceptance of the term and its correlate, Agnosticism. * * * Thus it will be seen that I have a sort of patent right in 'Agnostic.' It is my trade-mark and I am entitled to say that I can state authentically what was originally meant by Agnosticism. Agnosticism is the essence of science, whether ancient or modern. It simply means that a man shall not say he knows or believes that which he has no scientific grounds for professing to know or believe. * * * I have no doubt that scientific criticism will prove destructive to the forms of supernaturalism which enter into the constitution of existing religions. On trial of any so-called miracle, the verdict of science is 'not proven.' But Agnosticism will not forget that existence, motion, and law-abiding operation in nature are more stupendous miracles than any recounted by the mythologies and that there may be things, not only in the heavens and earth, but beyond the intelligible universe, which 'are not dreamt of in our philosophy.' The theological 'gnosis' would have us believe that the world is a conjurer's house; the anti-theological 'gnosis' talks as if it were a 'dirt-pie' made by two blind children, Law and Force. Agnosticism simply says that *we know nothing of what may be beyond phenomena.*" †

In another passage the great English biologist states his views concerning the immortality of the soul:

"If anybody says that consciousness cannot exist except in relation of cause and effect with certain organic molecules I must ask how he knows that; and, if he says it can, I must put the same question. And I am afraid that, like jesting Pilate, I shall not think it worth while (having but little time before me) to wait for an answer." ‡

If, with the Hindoo, we regard natural phenomena as a veil, we may compare the scientist to a man

* These lines were written by Prof. Huxley in 1884.

† The italics are ours.

‡ Prof. Huxley in the *Fortnightly Review*, Dec. 1886.

who dares to lift that veil, and reveals to us part of the hidden truth. But even so, many Agnostics say, our knowledge must remain incomplete. While we inquire into the manifestations of forces, while we observe how they operate, we shall never be able to know what Matter is and what Force is. Their relations in the phenomenal world may be knowable, but their absolute existence is unknowable.

In answer to this view we must state that there is no absolute force, no force of itself. The so-called 'phenomena' of forces are the realities, and the different forces, such as heat, electricity, etc., are abstract conceptions in which we embrace all the natural processes of one kind. Not 'force' and 'matter' are things to be comprehended; they in their turn have been invented to comprehend phenomena. They do not go beyond phenomena but simply classify and arrange them, in order to comprehend them all together, if possible, in one unitary and consistent system.

Prof. Huxley, while confessing himself to be an Idealist, in an address on Descartes's 'Discourse,' introduces at the same time the mysticism which naturally follows from the principle of Agnosticism that "we know nothing of what may be beyond phenomena." Prof. Huxley says:

"If I say that *impenetrability* is a property of matter, all that I can really mean is that the consciousness I call *extension* and the consciousness I call *resistance*, constantly accompany one another. Why and how they are thus related is a mystery; and if I say that thought is a property of matter, all that I can mean is that, actually or possibly, the consciousness of extension and that of resistance accompany all other sorts of consciousness. But as in the former case, why they are thus associated, is an *insoluble mystery*."^{*}

The concepts 'Impenetrability,' 'Extension,' and 'Resistance,' as they appear in our consciousness, are abstracts which denote certain qualities to be met with in our experience. If the spheres of two abstracts cover, either entirely or in part, the same ground, then as a matter of course the two ideas will always (either entirely or in part) appear to be associated. We form the abstract idea of matter by noting the qualities of all the different kinds of matter, dropping their individual features and retaining those only which they possess in common. Two qualities of matter (the two features which all matters have in common) are generalized under the names of mass and volume. Mass and volume, both being abstracts of the same object, *viz.*, of matter, it is but natural that they will always be associated, the one with the other. According to Prof. Huxley's method we should say: Why the consciousness I call 'mass' and the consciousness I call 'volume' constantly accompany one another is an insoluble mystery.

If we take the agnostic standpoint, the whole world becomes enigmatic and even such a fact as that the con-

sciousness we call 'liquid' constantly accompanies the consciousness we call 'fluid' would appear as a profound mystery.

Professor Bain shows in his "Practical Essays," p. 56, that the word 'mysterious' has sense only if used in opposition to what is plain and intelligible:

"When we are told * * * that *everything is mysterious*; that the simplest phenomenon in nature—the fall of a stone, the swing of a pendulum, the continuance of a ball shot in the air—are wonderful, marvelous, miraculous, our understanding is confounded; there being then nothing plain at all, there is nothing mysterious. * * * If all phenomena are mysterious, nothing is mysterious; if we are to stand aghast in amazement because three times four is twelve, what phenomenon can we take as the type of the plain and the intelligible?"

Prof. Huxley in answer to two onslaughts on his position (one by Dr. Wace from the standpoint of orthodox theology, the other by Mr. Harrison, the defender of the Comtean Positive Philosophy), most ably and, indeed, successfully defends his agnosticism.* It is almost superfluous to state that we concur with him wherever he objects to the antiquated belief of demonology. When he characterizes agnosticism as the principle 'Try all things and hold fast by that which is good' and when he identifies it with "the axiom that every man should be able to give a reason for the faith that is in him," we heartily and fully agree with his agnosticism; our objection holds *only* in so far as Professor Huxley says "that we know nothing of what may be beyond phenomena."

* * *

KANT'S philosophy and especially his doctrine of the unknowability of 'things of themselves' have given, it is true, a great ascendancy to agnosticism and at the same time to the mysticism of antiquated orthodoxy. Nevertheless the spirit of Kantian thought is far from both, and it leads neither to the one nor to the other of these deadly antagonists, but to a unitary conception of the world on the ground of positive facts—a conception which may be called Positivism,† or Monism.

Kant's philosophy, we must bear in mind, is not a system but a method. He tried to avoid the faults of Wolf's Dogmatism on the one side, and of Hume's Skepticism on the other. Thus, he proposed what he called Criticism. He did not offer a plain and outspoken solution of the problems, but he did the work to enable others to solve them: he formulated the problems.

^{*} *Nineteenth Century* February, 1889. Prof. Huxley informs us in this article that Sir William Hamilton's essay "On the Philosophy of the Unconditioned" which he read when a boy had stamped upon his mind the strong conviction that the limitation of our faculties in a great number of cases renders real answers to certain questions not merely actually impossible but theoretically inconceivable.

[†] The introduction of the word "Positivism" into philosophy is the merit of M. Auguste Comte. Although we cannot accept M. Comte's conception of Positivism, we gratefully adopt the name, which, as a synonym of Monism, is a strong and expressive term.

Kant discusses (in Chap. III of the Transcendental Doctrine of the Faculty of Judgment) the "discrimination of all objects as phenomena and noumena." Phenomena are the natural processes which affect our senses (*Sinneswesen*). They are the data of our experience and provide the building materials out of which we create our conceptions of things. Noumena, in contradistinction to phenomena, are pure ideas (*Verstandeswesen*). Kant used the word "noumenon" in its original sense. It is the present passive participle of *voiv* 'to think' and means 'something thought' or 'a creation of our mind.'

Concerning noumena or pure thoughts Kant emphatically declares that they have no significance unless they have reference to the phenomenal, *i. e.*, to the real sensations of our experience.

Kant says: †

"Everything which the understanding draws from itself, without borrowing from experience, it nevertheless possesses only for the behoof and use of experience. * * *

"That the understanding, therefore, cannot make of its *a priori* principles, or even of its conceptions, other than an empirical use, is a proposition which leads to the most important results.

"A transcendental use is made of a conception in a fundamental proposition or principle, when it is referred to things *in general* and considered as things *in themselves*; an empirical use, when it is referred merely to *phenomena*, that is, to objects of a possible *experience*. That the latter use of a conception is the only admissible one, is evident from the reasons following.

"For every conception are requisite, firstly, the logical form of a conception (of thought) in general; and, secondly, the possibility of presenting to this an object to which it may apply. Failing this latter, it has no sense, and is utterly void of content, although it may contain the logical function for constructing a conception from certain data.

"Now an object cannot be given to a conception otherwise than by intuition, and, even if a pure intuition antecedent to the object is *a priori* possible, this pure intuition can itself obtain objective validity only from empirical intuition, of which it is itself but a form. All conceptions, therefore, and with them all principles, however high the degree of their *a priori* possibility, relate to empirical intuitions, that is to data towards a possible experience. Without this they possess no objective validity, but are a mere play of imagination or of understanding with images or notions. * * *

"The conceptions of mathematics would have no significance, if we were not always able to exhibit their significance in and by means of phenomena (empirical objects). * * *

"The pure categories are of no use at all, when separated from sensibility."

In the second edition of his Critique of Pure Reason, Kant has inserted a few paragraphs, in which he discusses "the causes why we (not yet satisfied with the substratum of sensation) have added the noumena to the phenomena." "We have learned," he says, "that sensation does not perceive things of themselves, but as they appear to us in accordance with our subjective condition." Now, as they cannot be appearances of themselves, we suppose that something must

correspond to it, something which is independent of sensation.

Kant distinguishes two kinds of noumena. Noumena, in the positive sense, he defines to be those that are supposed to have originated in a non-sensuous intuition, and declares that they are inadmissible:

"We in this case assume a peculiar mode of intuition, an intellectual intuition, to wit, which does not, however, belong to us, of the very possibility of, which we have no notion."

Noumena, in the negative sense, Kant calls things in so far as we abstract from sensation altogether; they are pure ideas, merely formal thought. They are not only admissible but for certain purposes necessary.

"A noumenon considered as merely problematical, is not only admissible but even indispensable. * * * It is a negative extension of reason. * * * We limit sensation by giving to things of themselves (in so far as they are not considered as phenomena) the name of noumena."

"The division of objects into phenomena and noumena, and of the world into a *mundus sensibilis* and *intelligibilis* is therefore quite inadmissible in a positive sense (although conceptions do certainly admit of such a division); for the latter class of noumena have no determinate object corresponding to them, and cannot therefore possess objective validity.

* * * "After all, the possibility of such noumena is quite incomprehensible, and beyond the sphere of phenomena all is for us a mere void. * * * What, therefore, we call noumenon, must be understood by us as such in a *negative* sense."

Thus the question whether our reason, in addition to its admitted empirical use, can be employed in a transcendental way to noumena as objects, is answered by Kant in the negative.

The root of false noumenalism, it seems to us, must be sought in language. It is a misconception of the nature of words which leads us to think that things are absolute existences, being independent of, and distinct from their qualities. If we keep a clear conception, however, of the way words have arisen, and of the purpose they serve, we shall not fall into this dualism that believes in an absolutely unknowable world supposed to be hid behind the knowable world of sense-phenomena.

Words are, so to speak, bundles of percepts. If we pull single percepts out, the bundle is still a bundle; but if we take away all, there is no bundle left, there is nothing remaining that made the bundle a bundle; we have left only an empty nothing. If we take away from a thing all the properties that we are accustomed to comprehend by a word, there is left the meaningless word, a mere sound, the bare string with which the bundle was tied together.

The world is not in a rigid unchangeable state, but in a continuous flux. Yet knowledge becomes possible only when we fix certain percepts and give them relative stability. The faculty of fixing and retaining percepts, namely memory, is therefore the ladder that leads us upwards to a higher spiritual existence;

† Translation by Meiklejohn.

it affords the mechanical means of gaining a firm foothold in the course of eternal changes.

It is as if we sat in an express train and were looking at the landscape flitting by us. The picture, taken as a whole, swims indistinctly before our eyes. If we wish to get a clear idea of the situation, we must allow the eye to rest on some one object, neglecting the others. This we do, in viewing nature, by the concept, *i. e.*, by the word. Words are the instruments by which we fix, in symbols of sound, certain classes of events, perceptions, or experiences; giving them a relative stability despite the universal change of things. In this rests the importance of words, for it is only in this way that we can at all separate a group of occurrences from the course of nature, in order to scrutinize them closely, and to understand them. We must always bear the fact in mind that the element of stability that seems to be present in many words, is a fiction designed to serve a definite purpose. Absolute rest does not exist. Things are in a constant flux, and if we give our words and concepts a relative fixity, we must nevertheless not seek in them eternal existences, or absolute entities, as did Plato, in his 'Ideas.' *

CORRESPONDENCE.

WHO MAKES THE "LAND-VALUE" OF A FARM?

To the Editor of THE OPEN COURT:—

IN THE OPEN COURT for Feb. 28th, I am honored by criticisms from three advocates of Mr. George's plan of taxation. Those criticisms are evidently written by men competent to defend their own position and attack mine. They have the advantage of me, for I have not their ability to analyze and compare the abstract properties of things. I cannot separate the shadow of a tree from the tree itself, nor the value of land from the land.

My critics complain that I do not correctly state Mr. George's doctrine; and they kindly advise me to read him again. Well, I will if they will. Mr. Williamson says that Mr. George's position is that "almost all the value of land comes from the growth and labor of the community, and not from the individual who legally owns the land;" while his brother critic, Mr. Stephenson, says the strongest claim of Mr. George is that "the value of land is *entirely* due to the labor of the whole community." I have placed "almost" and "entirely" in italics for easier comparison. Which is Mr. George's word? Somebody has made a mistake as to his position here. Either Mr. Williamson or Mr. Stephenson ought to read Mr. George's works again.

The variance above noticed is of no importance to the main argument if both statements are erroneous, as I think they are. I do not know how to dissect the doctrine based upon them, but I do know how to analyze a farm, because I have seen farms made, and have helped to make them. Here is the process used in Illinois.

In the first place the virgin soil was communistic property; it belonged to all the people of the United States, and it was expressively described as "Government" land. The experience of my old acquaintance, Thomas Clark, will illustrate the subject like a book. Having selected a quarter-section of land in Boone County

for his future home, Tom Clark was immediately confronted by Mr. George's law. The government said to him: "This land is the common property of all the people, and before you can have it, you must pay to the people the land-value of that quarter-section. This is fixed at a dollar and a quarter an acre. Tom paid the money, and took the land. Then he broke forty acres at a cost of three dollars an acre. His quarter-section was now worth \$320 in visible value. Next he built a house and barn upon the land, and fenced the forty acres with rails. By this time his plantation in the rough was worth about \$500. How much of that value was due to the labor of the "community?" Absolutely none of it; and yet this is the way "land-values" were made in Illinois. The settler who furnished all the labor, and all the capital, and made all the value the land possesses, is coolly described by Mr. Stephenson as the "alleged" owner of the land. He is also the "alleged" owner of the "alleged" fence, and the "alleged" house and barn.

In the wilderness of occult economics I can easily lose my way, but I get along fairly well by the aid of an object lesson so large and palpable as a farm. I ask my critics how they will apply Mr. George's doctrine of taxation to the farm which I have just described. By much wear of muscle and sweat of brow, Tom Clark has brought the whole quarter-section under cultivation, and there is an orchard in one corner of it. Now, which of the ingredients of this farm shall bear the single tax? Is it the breaking of the wild sod? Is it the fence, the barn, or the apple trees? This is a fair question, and it ought to be fairly answered. It is never answered. It is evaded thus: "We do not propose to tax any of these improvements nor the land itself; we only propose to tax the *land-value* of the whole farm."

In that evasion the single tax on values' theory vanishes "like the feverish dream of a summer's night." The land-value of that farm separate from the improvements, is *nothing*. I have Mr. George for that. In "Protection and Free Trade," page 291, he says, "Land in itself has no value. Value arises only from human labor." If so, we tax human labor when we tax land-values. Whose labor made the land-value of that farm? Was it the labor of the man who ploughed the land, split the rails, built the house, and planted the apple trees, or was it the labor of the "Community"? The community did nothing; and besides, it had sold its communal right in the land for a dollar and a quarter an acre?

I repeat that Mr. George loses sight of his own doctrine that land of itself has no value, when he says, page 302: "Now, it is evident that in order to take for the use of the community, the *whole income* arising from land, it is only necessary to abolish one after another, all other taxes now levied, and to increase the tax on land-values until it reaches as near as may be the *full* annual value of the land." Now, if the government takes from Clark the "full annual value" and "the whole income" of his farm, whether by tax, rent, or confiscation, it practically takes the whole farm and all the product of his life-time industry.

It is paltering in a double sense to separate the value of that farm from the farm itself. It is pure mystification to say, "We tax the flavor of the apples, but not the apple trees, nor the land on which they grow; we tax the fragrance of the roses, but not the flowers nor the garden; we tax the sweetness of the grapes, but not the vineyard nor the vines." If the tax upon the sweetness of the grapes is not paid, that sweetness is not levied on, but the vineyard is arrested and sold. In like manner, when the tax on land-values becomes delinquent, the land itself is taken. In the language of my critic, Mr. McGill, "the owner of the improvements pays the annual value of the land to the freeholder. Under Mr. George's system he would pay it to the municipality. In either case he must pay it or *lose his improvements*."

Mr. McGill says that Mr. George's experiments "are a plea for the application of the 'Moral Law.'" I do not doubt that Mr.

* Under the title of "The Oneness of the Phenomenal and Noumenal," in No. 84, a further development of the problem here discussed, will be presented.

George and Mr. McGill conscientiously believe that; but I can hardly imagine anything more immoral and despotic than a law which would attach Mr. George's theory to the farm I have described, and take from the farmers who made the farm "the whole income" of it, and its "full annual value." The farm that I have selected is not an exceptional instance; it is a fair example of the manner in which "land-values" have been made in Illinois and all the Western States. If the answer to this is that the land-value of city lots is not made in that way, I reply: Very well; then let Mr. George apply his doctrine where it fits, and where the application of it can do no wrong, if there is any such place, which I doubt.

Mr. Stephenson requires me to "point out the exact place in Progress and Poverty where the millenium is promised by the simple means of a single tax on land;" and also, "where Mr. George denounces every progress, under present circumstances, as driving a parting wedge between the rich and poor." I will cheerfully do so. Let Mr. Stephenson read pages 326 and 327, where Mr. George describes the condition of public happiness which would result from levying a simple tax on land. It is too long to quote here, but it describes that social state which is usually called the millenium. "We should reach the ideal of the socialist," says Mr. George, "but not through governmental repression."

For answer to the second question, I refer my critic to page 11, where, after confessing the vast progress made in "comfort, leisure, and refinement," Mr. George says this: "In those gains the lowest class do not share." Then, further on, he says, "The new forces, elevating in their nature though they be, do not act upon the social fabric from underneath, but strike it at a point intermediate between top and bottom. It is as though an immense wedge were being forced, not underneath society, but through society."

Personally, I think there is much truth in that statement, but I believe that Mr. George's remedy would make matters worse instead of better. To levy each year a tax upon Clark's farm equal to the "full annual value" of it,—and to deprive him of the "whole income" arising from the land, would be adding another injustice to the wrongs which afflict society now.

Here is a circular explanation of Mr. George's doctrine which mystifies me like a Greek oracle. Mr. Williamson says: "Now, if you tax the value of land you are taxing the labor of the whole community, slightly, and the natural opportunity and growth of the community; but as the taxes are expended on the community—for the growth of the community—nobody is injured and the growth pays for the growth."

Isn't that chopping sand? What is the use of taxing the labor of the whole community, slightly, to expend the taxes on the community, slightly? And how does the growth of the community pay for the growth of the community? I have traveled round and round this proposition looking for a gate-way to its meaning, until I am giddy. To tax the value of land belonging to the whole community is to impose upon ourselves the cannon-ball torture for nothing. One of our punishments in the army was this: A circle was drawn on the ground about 90 feet in diameter. On the outer edge of the circle, holes were dug about a yard apart. In one of the holes was a 32 pound cannon ball. The delinquent had to pick up this cannon-ball and drop it into the next hole, then take it from that and drop it into the next, and so on, round and round, for so many hours a day. This was done as punishment, but Mr. Williamson wants to do it for fun, by the whole community taxing the labor of the whole community, the taxes to be expended on the whole community.

When Tom Clark's quarter-section belonged to the whole community it was never taxed at all, because there is no sense in a community levying taxes upon the values of its own land, and paying the taxes into its own treasury. I once knew a man who fined

himself a dollar every time he used profane language, but he merely took it from one pocket and paid it into the other.

If Mr. Williamson means to say that taxing the land-values of Tom Clark's farm taxes the labor of the whole community, I think he makes a mistake. It appears to me that the taxation is levied upon the labor of Clark, and the taxes ought not to be "expended on the community." WHEELBARROW.

DREAMS, SLEEP, AND CONSCIOUSNESS.

To the Editor of THE OPEN COURT:—

AMONG many interesting communications to me regarding my paper in a late number of your journal there is one of peculiar interest from one of your subscribers in England. He states that he has been able to conquer an insomnia of long standing by the device of looking downward when trying to go to sleep. He was prevailed upon to try the device of, in fancy, watching the breath escape from his own nostrils. He found this successful but concluded that the rotation of the eye downward was the essential factor. Thinking of this I have wondered if this were not something more than an individual idiosyncrasy, if indeed it were not founded upon a true basis of cerebral habit and necessity. That the eye is the most easily reacting of all sense-mechanisms is a truism, and that of all it is the most intimately connected with all cerebral and psychological processes. Not only this, but the facts of functional amblyopia from prolonged exposure to light, such as moon-blindness, snow-blindness, etc., show how injurious to the eye is such continuous stimulus. Neither for the objects of shutting out the external world of light nor for protection to the eyes, is the darkening of the lids sufficient. Sound sleep and retinal safety demand either a complete external darkness, or a rotation during sleep, as my correspondent says he has found in his own case, of the eye ball upward beneath the arch of the eyebrow. I believe it has been experimentally found that in sleep the globes do rotate upward. It may, however, be true that the necessity was greater and the fact more constant in primitive or savage man than in the civilized man of to-day. The savage slept more frequently in the open air. But if true in either case, the mechanism whereby this act was done, required a constant expenditure of force to effect it, and therefore a watchfulness, an activity of nerve centres somewhere, that rendered the whole cerebral machinery less passive than if it were not compelled to keep up such continuous functional output. Somnolence was therefore less complete, the restorage function more drawn upon, the "sentinal" was more alert. If, therefore, such continuous innervation of the superior recti serve to keep the cerebral organism from sinking so speedily or completely into slumber, then relieving it from such duty of out going stimulation would thus serve to becalm and quiet it. Reversal of the habitual bulbar rotation would thus serve to relieve the centres of the superior recti, and divide the stimulus to the inferior, thus setting up a sort of relief and rest for the too continuously acting centre. It is true that during waking the superior rectus has the least work of all the muscles, and therefore is better able to take up the continuous work of the night; it is also true that excessive innervation of the inferior rectus would be as arousing as that of the superior, and, finally, it may be said that the habit in the civilized man, sleeping as he does in closed rooms, might be dropped; but there remains as answer that continuous contraction of a muscle means waking activity of the centre, and its correlates; that the lower rectus will only be kept functional while the would-be sleeper is consciously making the effort; and lastly that old habits of nature or man are not soon stopped. Would not a better plan than that of my correspondent be that of slowly and rhythmically putting *all* the muscles of the eyes into alternate function, each for a few minutes at a time.

G. M. GOULD.

PROPOSITIONS AND KNOWLEDGE.

To the Editor of THE OPEN COURT:—

WITH your indulgence I beg to offer a few observations suggested by the remarks of Francis C. Russell, in number 78 of your valuable journal, under the title "Propositions vs. Axioms." Firstly, as to Propositions, I cannot understand what is meant by their "material content," unless it be that a given proposition referring to the material world, either affirming or denying something of or concerning matter in some of its forms, thence denotes something which in its essential character is material, or composed of matter; for assuredly matter itself cannot be contained within a Proposition as water may be said to be contained within a basin. Since Propositions are merely the creatures of the mind, their "content" can be no more material than the material of the mind,—if such an expression may be allowed. Propositions, as I understand the term, are but words, signs or symbols arranged in certain order to express definite ideas, and it is incorrect to speak of their content in any other terms than those applicable to the ideal. For example, the content of the proposition: All men are mortal, is the idea or notion that all men partake of the attribute mortality, or, that they are subject to the laws of matter. Whether or not all men are mortal is a scientific question, and the evidences tending to prove or disprove the proposition are facts either of a material, ideal, or spiritual nature, the relevancy or importance of which must be determined for us by the methods of logical reasoning.

Although Mr. Russell does not develop any theory of cognition or knowledge, he posits a proposition which would seem to lead us into speculative depths little less than a "bottomless pit." He states that "every cognition is determined by previous cognitions," etc.; that is to say, there can be no knowledge for us except there be an infinite series of preceding cognitions. If to Mr. Russell "cognition" and "knowledge" are synonymous in meaning, according to this theory we can have no knowledge except we have infinite knowledge. It is probably, however, that Mr. Russell attaches different meanings to the two words, whereas to me they are practically synonymous. In fact, we find in the same paragraph above quoted from the statement that knowledge is to be explained as a mere inference from "prior cognitions either alone or combined with * * * sense-presentation." Now, as to the merits of this latter statement it might be said that if, in some instances, knowledge is derived from or determined by prior cognition combined with mental impressions arising as data from the senses, we have a species of knowledge not wholly drawn from or determined by pre-existing cognition, and hence, in so far, a species of original or primary knowledge. Does not Mr. Russell mean to imply that knowledge has two sources of origin, namely, prior cognition, and sense-presentation?

A. M. G.

MR. RUSSELL IN EXPLANATION.

To the Editor of THE OPEN COURT:—

I KNOW very well that you cannot allow your columns to be overloaded with the polemics of philosophy. Philosophy, while vastly interesting to a few, is a weariness to the many. Still, I would like to resolve the obscurities that A. M. G. finds in my former letter. The leading motive of that letter was to combat the old and obstructive doctrine that axioms are finalities. In doing this I stated what I understand to be one of the well established doctrines of the modern theory of cognition, viz., that the entire body of our knowledge, axioms as well as the rest, are the result of reasoning. Of course, it would be impossible to "develop" any theory of cognition in a brief letter, nor was it needful. That yawning abyss of speculation discerned by A. M. G. as the leading of the doctrine he challenges, is a mere mirage. While it is quite true that that doctrine implies that knowledge is the result of an infinite series of prior cognitions, it is not true that an infinite series of cognitions implies infinite knowledge. The infinite series

one-half, plus one-fourth, plus one-eighth, etc., may be applied to any subject or quantity, however small.

It is also true that cognition and knowledge may be used as synonyms. But I spoke of *cognitions* (plural of a cognition) in the sense of articulated constituents of knowledge, not as intending the entire body of our intellectual possessions, and what I said was that "nowhere in the content of the mind is there to be found any iota of knowledge that cannot be explained as a mere inference," etc. I will be frank to allow that there is an apparent inconsistency between the two statements that all knowledge is the product of mere inference or reasoning, and that knowledge is also consequent on sense-presentation. This inconsistency is, however, merely apparent, not real; but to explicate it would require more space than I can obtain, and I conceive that my original contention against axioms does not require it of me. Should any one desire satisfaction in this matter, let me refer them to three articles by Prof. C. S. Pierce, in vol. 2, *Journal of Speculative Philosophy*.

In saying that all genuine propositions must have a material content, no reference was made to mass matter. A proposition is somewhat told about a thing. The thing is called the subject of the proposition, and the somewhat told the predicate, which either is or contains the uniting constituent or copula.

Verbal utterance is nonsense merely, unless it employs the mechanism of the proposition in some of its manifold forms. Every proposition bears some significance. It tells some tale. This may be termed its content. The telling of the proposition may add to or unfold the meaning of the subject, in which case the telling, tale, or content is material in contrast with the case in which the telling is formal merely, and neither adds to nor unfolds the signification of the subject, being a mere empty form or ghost of a telling. For example, take that esteemed "axiom": "Things that are equal to the same thing are equal to each other." Now, put it that here we have a sheet of tin and an orange and an apple! The sheet of tin shall be equal in weight to the apple, and the orange equal to it in volume. Are the orange and the sheet of tin equal? Clearly our "axiom" must be amended to say, Things that are equal in the same respect to the same thing are equal to one another in that same respect, which is the very same as to say, Equals are equal or $x=y$,—all formally valid, but pure emptiness.

When, however, I say that a straight or right line is a line such that between the points that bound any assigned part of it no copy of such part can be drawn, I tell something about the subject of my proposition—viz., a straight or right line—that does not appear in the mere naming of it, and hence, although the proposition states only a formal truth, it yet has in my sense a material content.

FRANCIS C. RUSSELL.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXII.—Continued.

Immediately upon quitting the apartment of the father, the Prince ordered his carriage, and then hastened to his sister. The Princess looked anxiously into his disturbed countenance.

"You are going away?" she exclaimed.

"Farewell!" he said, holding out his hand to her. "I am going into the country to build a new castle for us in case we should wish to change the scene of action."

"When do you return, Benno?"

The Hereditary Prince shrugged his shoulders.

* Translation copyrighted.

"When the Sovereign commands. My task is now to become something of an architect and farmer; this is a useful occupation. Farewell, Sidonie. If chance should bring you together with Mrs. Werner, I would be greatly indebted to you if you would not attend to the gossip of the Court, but remember that she is a worthy lady, and that I owe her a great debt of gratitude."

"Are you dissatisfied with me, my brother?" asked the Princess, anxiously.

"Make reparation for it, Sidy, as best you can. Farewell!"

Prince Victor accompanied him to the carriage. The Hereditary Prince clasped his hand, and looked significantly towards the Pavilion. Victor nodded. "That's my opinion too," he said. "Before I go back to my garrison I will visit you in the land of cat-tails. I expect to find you as a brother hermit, with a long beard and a cap made of tree-bark. Farewell, Knight Toggenburg, and learn there that the best philosophy on earth is to consider every day as lost on which one cannot do some foolish trick. If one does not do this business one's self, others will take the trouble off one's hands. Is is always more pleasant to be the hammer than the anvil."

* * *

The Sovereign was gloomy and silent at dinner; only short remarks fell from his lips, and sometimes a bitter jest, from which one remarked that he was striving for composure; the Court understood that this unpleasant mood was connected with the departure of the Hereditary Prince, and every one took care not to irritate him. The Professor alone was able to draw a smile from him, when he good-humoredly told about the enchanted castle, Solitude. After dinner the Sovereign conversed with one of his aides-de-camp as well as the Professor. The latter turned to the High Steward; and although he usually avoided the reserved politeness of the man, he on this occasion asked him some indifferent questions. The High Steward answered civilly that the Marshal, who was close by, could give him the best information, and he changed his place. Immediately afterwards the Sovereign walked straight through the company to the High Steward, and drew him into the recess of the window, and began:

"You accompanied me on my first journey to Italy, and, if I am not mistaken, partook a little of my fondness for antiquities. Our collection is being newly arranged and a catalogue fully prepared."

The High Steward expressed his acknowledgment of this princely liberality.

"Professor Werner is very active," continued the Sovereign; "it is delightful to see how well he understands to arrange the specimens."

The High Steward remained silent.

"Your Excellency will remember how when in Italy we were much amused at the enthusiasm of collectors who, luring strangers into their cabinets, wildly gesticulated and rhapsodized over some illegible inscription. Like most other men, our guest is also afflicted with a hobby. He suspected that an old manuscript lay concealed in a house in our principality; therefore he married the daughter of the proprietor; and as, in spite of that, he did not find the treasure, he is now secretly seeking this phantasm in the old garrets of the palace. Has he never spoken to you of it?"

"I have as yet had no occasion to seek his confidence," replied the High Steward.

"Then you have missed something," continued the Sovereign; "in his way he speaks well and readily about it; it will amuse you to examine more closely this species of folly. Come presently with him into my study."

The High Steward bowed; and on the breaking up of the party, informed the Professor that the Sovereign wished to speak to him.

The gentlemen entered the Sovereign's apartment, in order to afford him an hour of entertainment.

"I have told his Excellency," the Sovereign began, "that you have a special object of interest which you pursue like a sportsman. How about the manuscript?"

The Professor related his new discovery of the two chests.

"The next hunting-ground which I hope to try will be the garrets and rooms in the summer castle of the Princess; if these yield me no booty, I would hardly know of any place that has not been searched."

"I shall be delighted if you soon attain your object," said the Sovereign, looking at the High Steward. "I assume that the discovery of this manuscript will be of great importance for your own professional career. Of course you will consent to publish the same."

"It would be the noblest task that could fall to my lot," replied the Professor, "always supposing that your Highness would graciously entrust the work to me."

"You shall undertake the work, and no other," replied the Sovereign, laughing, "so far as I have the right to decide it. So the invisible book will be really of great importance to learning?"

"The greatest importance. The contents of it will be of the highest value to every scholar. I think it would also interest your Highness," said the Professor, innocently, "for the Roman Tacitus is in a certain sense a Court historian; the main point of his narrative is the characters of the Emperors who, in the first century of our era, decided the fate of the old world. It is indeed, on the whole, a sorrowful picture."

"Did he belong to the hostile party?" inquired the Sovereign.

"He is the great narrator of the peculiar deformity of character found in the sovereigns of the ancient world; we have to thank him for a series of psychological studies of a malady that then developed itself on the throne."

"That is new to me," replied the Sovereign, fidgeting on his chair.

"Your Highness will, I am convinced, view the various forms of this mental malady with the greatest sympathy, and will find in other periods of the past—nay, even in the earlier civilization of our own people—many remarkable parallel cases."

"Do you speak of a special malady that only befalls rulers?" asked the Sovereign; "physicians will be grateful to you for this discovery."

"In fact," answered the Professor, eagerly, "the fearful importance of this phenomenon is far too little estimated; no other has exercised such an immeasurable influence on the fate of nations. The destruction by pestilence and war is small in comparison with the fatal devastation of nations which has been occasioned by this special misfortune of the rulers. For this malady, which raged long after Tacitus among the Roman emperors, is not an ailing that is confined to ancient Rome—it is undoubtedly as old as the despotisms of the human race; even later it has been the lot of numerous rulers in Christian states; it has produced deformed and grotesque characters in every period; it has been for thousands of years the worm enclosed in the brain, consuming the marrow of the head, destroying the judgment and corroding the moral feelings, until at last nothing remained but the hollow glitter of life. Sometimes it became madness which could be proved by medical men, but in numerous other cases the capacity for practical life did not cease and the secret mischief was carefully concealed. There were periods when only occasional firmly-established minds preserved their full healthy vigor; and again other centuries when the heads that wore a diadem inhaled a fresh atmosphere from the people. I am convinced that he whose vocation it is to investigate accurately the conditions of later times will, in the course of his studies, discover the same malady under a milder form. My life lies far from these observations, but the Roman state undoubtedly shows the strangest forms of the malady; for there were the widest relations, and such a powerful development of human nature both in virtue and vice as has seldom since been found in history."

"It seems to be a particular pleasure to the learned gentlemen to bring to light these sufferings of former rulers," said the Sovereign.

"They are certainly instructive for all times," continued the Professor, confidently, "for by fearful examples they impress upon one the truth that the higher

a man's position is, the greater is the necessity of barriers to restrain the arbitrariness of his nature. Your Highness's independent judgment and rich experience will enable you to discern, more distinctly than any one in my sphere of life, that the phenomena of this malady always show themselves where the ruling powers have less to fear and to honor than other mortals. What preserves a man in ordinary situations is that he feels himself at every moment of his life under strict and incessant control; his friends, the law, and the interest of others surround him on all sides, they demand imperiously that he should conform his thoughts and will by rules which secure the welfare of others. At all times the power of these fetters is less effective on the ruler; he can easily cast off what confines him, an ungracious movement of the hand frightens the monitor forever from his side. From morning to evening he is surrounded by persons who accommodate themselves to him; no friend reminds him of his duty, no law punishes him. Hundreds of examples teach us that former rulers, even amidst great outward success, suffered from inward ravages, where they were not guarded by a strong public opinion, or incessantly constrained by the powerful participation of the people in the state. We cannot but think of the gigantic power of a general and conqueror whose successes and victories brought devastation and excessive sin into his own life; he became a fearful sham, a liar to himself and a liar to the world before he was overthrown, and long before he died. To investigate similar cases is, as I said, not my vocation."

"No," said the Sovereign, in a faint voice.

"The distant time," began the High Steward, "of which you speak, was a sad epoch for the people as well as the rulers. If I am not mistaken a feeling of decay was general, and the admired writers were of little value; at least it appears to me that Apuleius and Lucan were frivolous and deplorably vulgar men."

The Professor looked surprised at the courtier.

"In my youth such authors were much read," he continued. "I do not blame the better ones of that that period, when they turned away with disgust at such doings, and withdrew into the most retired private life, or into the Theban wilderness. Therefore when you speak of a malady of the Roman emperors, I might retort that it was only the result of the monstrous malady of the people; although I see quite well that during this corruption individuals accomplished a great advance in the human race, the freeing the people from the exclusiveness of nationality to the unity of culture, and the new ideal which was brought upon earth by Christianity."

"Undoubtedly the form of the state, and the style of culture which each individual emperor found, were decisive for his life. Every one is, in this sense, the

child of his own time, and when it is a question of judging the measure of his guilt, it is fitting to weigh cautiously such considerations. But what I had the honor of pointing out to his Highness as the special merit of Tacitus, is only the masterly way with which he describes the peculiar symptoms and course of the Cæsean insanity."

"They were all mad," interrupted the Sovereign, with a hoarse voice.

"Pardon, gracious Sir," rejoined the Professor, innocently. "Augustus became a better man on the throne, and almost a century after the time of Tacitus there were good and moderate rulers. But something of the course which unlimited power exercises on the soul may be discovered in most of the Roman emperors. In the better ones it was like a malady which seldom showed itself, but was restrained by good sense or a good disposition. Many of them indeed were utterly corrupted, and in them the malady developed in definite gradation, the law of which one can easily understand."

"Then you also know how these people were at heart!" said the Sovereign, looking shyly at the Professor.

The High Steward retreated towards a window.

"It is not difficult in general to follow the course of the malady," replied the Professor, engrossed with his subject. "The first accession to power has an elevating tendency. The highest earthly vocation raises even narrow-minded men like Claudius; depraived villians like Caligula, Nero, and Domitian, showed a certain nobleness at first. There is an eager desire to please, and strenuous exertion to establish themselves by graciousness; a fear of influential persons or of the opposition of the masses compels a certain moderation. But arbitrary power has made men slaves, and the slavish feeling shows itself in an abject veneration which puts the emperor on a pinnacle above other men; he is treated as if specially favored by the gods, nay, as if his soul was an emanation of godly power. Amid this adoration by all, and the security of power, egotism soon increases. The accidental demands of an unrestrained will become reckless, the soul gradually loses the power of distinguishing between good and evil; his personal wishes appear to the ruler henceforth as the necessity of the state, and every whim of the moment must be satisfied. Distrust of all who are independent leads to senseless suspicion; he who will not be pliant is set aside as an enemy, and he who adapts himself with suppleness is sure to exercise a mastery over his master. Family bonds are severed, the nearest relations are watched as secret enemies, the deceptive show of hearty confidence is maintained, but suddenly some evil deed breaks through the veil that hypocrisy has drawn over a hollow existence."

The Sovereign slowly drew back his chair from the fire into the dark.

"The idea of the Roman state at last entirely vanishes from the soul, only personal dependence is required; true devotion to the state becomes a crime. This helplessness, and the cessation of the power of judging of the worth—nay, even of the attachment of men—betoken an advance of the malady by which all sense of accountability is impaired. Now the elements of which the character is formed become more contracted and onesided, the will more frivolous and paltry. A childish weakness becomes perceptible; pleasure in miserable trifles and empty jokes, together with knavish tricks which destroy without aim; it becomes enjoyment not only to torment and see the torments of others, but also an irresistible pleasure to drag all that is venerated down to a common level. It is very remarkable how, in consequence of this decay of thought, an unquiet and destructive sensuality takes the place of all. Its dark power becomes overmastering, and instead of the honorable old age which gives dignity even to the weak, we are disgusted by the repugnant picture of decrepit debauchees, like Tiberius and Claudius. The last powers of life are destroyed by shameless and refined profligacy."

"That is very remarkable," repeated the Sovereign, mechanically.

The Professor concluded: "Thus are accomplished the four gradations of ruin; first, gigantic egotism; then suspicion and hypocrisy; then childish senselessness; and, lastly, repugnant excesses."

The Sovereign rose slowly from his chair; he tottered, and the High Steward drew near to him terrified, but he supported himself with his hand on the arm of the chair, and, turning languidly to the Professor without looking at him, said, slowly:

"I thank the gentleman for a pleasant hour."

One could perceive the effort which it cost him to bring out the words.

In going out the Professor asked in a low tone of the High Steward:

"I fear I have wearied the Sovereign by this long discussion?"

The High Steward looked with astonishment at the frank countenance of the scholar:

"I do not doubt that the Sovereign will very soon show you that he has listened with attention."

When they were on the stairs they heard a hoarse, discordant sound in the distance; the old gentleman shuddered, and leaned against the wall.

The Professor listened; all was still.

"It was like the cry of a wild beast."

"The sound came from the street," replied the High Steward.

(To be continued.)

MOODS.

BY MARY MORGAN (GOWAN LEA).
Author of "Woodnotes in the Gleaming," etc.

I.

DARKNESS.

Am I then man, and yet am I not free?
Am I a slave, with hands and feet in chains?
Can I but move as far as go the reins?
Some tyrant power always restraining me?
Or is the slavery within my breast
Invisible to the great world of men?
Almost invisible to mortal ken
Yet never leaving me to peace and rest?
My cruel hands I did not fashion—no!
They were imposed; in truth I had no choice.
Could I but shake them off with a 'let go'!
And they straightway obey the mandate's voice!
Alas, if man be born to slavery,
His will not dowered with supremacy!

II.

With the physical eye I watched the night-sky and the course of the stars;
with the mental eye I glanced at the dark background of the past
and traced the thought-paths through the ages.

DAWN.

Imperfect human work! Of tumult born;
Of discord; and with painful struggle too;
As if with every morning's breath man drew
A subtle poison by which peace is torn.
Imperfect human work! With each advance,
Achieved at length through many tears of woe
And joy commingled, man need not forego
The while a glimpse into that great expanse
Wherein the absolute, all-perfect force
Conducts the systems of the world's unseen,
(The suns of thought) in their transcendent course.
The mortal eye is dazzled, and must screen
Itself from light it cannot yet endure—
A light all-powerful, all-kind, all-pure!

NINE XENIONS.

TRANSLATED FROM GOETHE AND SCHILLER'S MUSENALMANACH.

BY * * *

A MOTTO.

Truth I am preaching. 'Tis truth and nothing but truth—understand me.

My truth of course! For I know none to exist but my own.

A PHILOSOPHICAL DISCUSSION.

One, we can hear, speaks after the other; but no one
Answers the other. Who calls two monologues a dispute?

A PHILOSOPHER.

Cogito ergo sum: I am thinking and therefore existing.

If but the former is true, there's of the latter no doubt.

MY ANSWER.

If I am thinking, I am. Very well! But who's constantly thinking?
Often I was, I confess, when I thought nothing forsooth.

TO CERTAIN PEOPLE.

What a great pity, dear sirs! To select the good you are anxious;
But mother Nature deprived you of sound judgment and wits.

ANALYSTS.

Do you take truth as an onion whose layers you singly can peel off?
Never you'll draw out the truth, save 'twas deposited there.

REPETITION.

Let me repeat it again and again that error is error
Whether pronounced by a fool or by a prominent sage.

THOSE IN AUTHORITY.

Don't be disturbed by the barking; remain in your seats, for the barkers

Wish but to get in your place, there to be barked at themselves.

SPIRIT AND LETTER.

Truly you can for a time palm off your valueless counters,

But in the end, my dear sirs, debts must be paid in cold cash.

NOTES.

The essay upon "Sensation and the Outer World," by M. Binet, will appear in our next issue.

Prof. Bunge, of Basel, discusses a very important and much-debated problem in his pamphlet "Vitalism and Mechanism." A physico-chemical explanation of the phenomena of life is not to be thought of, Prof. Bunge says; the whole history of physiology disproves this notion.

Prof. Bunge, in another pamphlet we have received, entitled "The Alcohol Question," unreservedly supports the cause of temperance, advancing arguments to justify total abstinence from the standpoint both of the individual and the State. The teetotalers of America will undoubtedly rejoice at this sign of unselfish liberalism in the scientific circles of a wine-growing country; Prof. Bunge's arguments are irresistible, when rationally regarded. (Leipsic: F. C. W. Vogel, Pub.)

Mr. Joseph Jefferson, the genial and talented actor, has long been at work upon an autobiography which will be published in the *Century* during the coming autumn. Mr. Jefferson's personality is perhaps the most sympathetic of any upon our stage, and we will await with great interest the reminiscences of his life, and the portraits he has drawn of contemporary artists.

Prof. Cope asks at the close of his thoughtful essay on *Ethical Evolution*, "Is the love derived from Natural Sources?" We think it is, if by 'nature' is to be understood the living, growing, and creating Universe. The view of "the paternal relation" is, we confess, the most beautiful allegory under which God can be conceived; but we should not forget that after all, it remains an allegory.

In an eloquent sermon, "The Glorious Trinity," Rev. John W. Chadwick remarks: "Let the methods of theology be frankly those of science, let the methods of her criticism be those of the most cautious and discriminating of our great historians and biographers, and, if her representatives still prefer to say, 'We walk by faith, and not by sight,' they will be entirely welcome to do so. When Faith is perfectly at one with Reason and with Science, the more of it the better." (George H. Ellis, Pub., Boston.)

The Humboldt Publishing Co., of 24 East 4th street, N. Y., have published in their Library Series, Grant Allen's "Force and Energy; A Theory of Dynamics," (price 15 cents). In the first part the author advances a theory of transcendental dynamics, which he afterwards applies to the creation of the universe. Force and Energy are defined as the two manifestations of power; the first tending to initiate aggregative motion, finds its expression in gravitation, adhesion, chemical affinity, etc.; the second shows its vitality in the separative powers classified as molar, molecular, chemical, and electrical modes or manifestations of motion. Mr. Allen ingeniously illustrates these operations by explaining the aggregation of the earth into solid bodies, like planets, on the one hand, and by explaining also the movements of the planets in their orbits about the sun.

The author has invented these distinctions of Energy and Force himself, and it is not to be expected that scientists will be pleased with the definitions given by Mr. Allen.

"THE MICROSCOPE," FOR 1889.

The leading exponent of Microscopy in the United States.

The representative of what is best, most instructive, and progressive in American Microscopy.

An enterprising and liberal purveyor of Microscopical News selected from the most reliable scientific journals of Europe and America.

A reliable teacher for the beginner, and a medium through which advanced workers publish to the world the results of their labors.

Among the contributors to this journal are:

Prof. CHAS. E. BESSEY, University of Nebraska.

Prof. T. J. BURRILL, University of Illinois.

Prof. M. D. EWELL, Northwestern University.

Prof. J. WALTER FEWKES, Harvard University.

Prof. C. H. STOWELL, University of Michigan.

Prof. S. H. GAGE, Cornell University.

Prof. H. L. SMITH, Hobart College.

Dr. ALFRED C. STOKES.

Prof. JOHN A. BRASHEAR.

Prof. HENRY MILLS.

Prof. H. M. WHELPLEY.

Dr. F. L. JAMES.

E. H. GRIFFITH, Esq.

C. M. VORCE, Esq.

And many other well-known writers on microscopy.

Each number is replete with information valuable to educated Americans who desire to acquire a scientific knowledge in its broadest sense.

Fundamental Problems.

The Method of Philosophy as a Systematic Arrangement of Knowledge.

By Dr. PAUL CARUS.

PRICE 75 CENTS.

This collection of essays, originally published as editorial articles in THE OPEN COURT, forms a connected and progressive series of discussions upon the fundamental problems of philosophy. The fundamental problems of philosophy may be divided into two titles: 1. What is the origin, the foundation, the law or method of our cognition? and 2. What is its purpose? What is its use, its application? The former demands as an answer a conception of the world and life, a theoretical philosophy; the latter a system of ethics, a practical and moral philosophy. The solution of the former problem, proposed in this work, is termed Monism; of the latter, Meliorism. The two are complementary and correlative; each is the completion and logical outcome of the other. Based upon the all-pervading harmony and unity of nature, Monism stands opposed to Materialism, Spiritualism, and Dualism in every form. Its ethics has in view the betterment of life, it rejects the principles of pessimism that lead to despondency, and cannot accept the views of optimism that breed nervousness.

Secular Thought

A Journal of Liberal Thought.

The Official Organ of the Canadian Secular Union.

\$2 a Year. Published Weekly. Single Copy, 5c.

CHARLES WATTS, EDITOR.

31 Adelaide Street East, Toronto, Ont., Canada.

Read what Colonel Ingersoll says:

"I am greatly pleased with 'Secular Thought'—with its form, arrangement, and contents—above all, with its spirit. It is splendid. I don't see how it could be better. I read it with the greatest of pleasure." Col. ROBT. G. INGERSOLL.

Read what Helen H. Gardener says:

"Permit me to congratulate you on the fine appearance and tone of 'Secular Thought'. I heartily congratulate our Canadian friends upon the fact that they are represented by a paper of which they can be justly proud, and which they need never hesitate to hand to their most delicate-minded friends, however religious they may be." HELEN H. GARDENER.

PUBLICATIONS OF "THE OPEN COURT."

DREAMS, SLEEP, and + CONSCIOUSNESS.

By GEORGE M. GOULD, M. D.

PRICE 15 CENTS.

The researches of Dr. Gould upon the nature of consciousness, as studied from the facts of sleep and dreams, are highly interesting, not only as affording suggestions of scientific value, but as exhibiting marks of an exact and cultivated introspective talent.

The Idea of God.

By Dr. PAUL CARUS.

PRICE 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing:

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Theism, the Monistic Conception of God.

Principles of Art.

From the Standpoint of Monism and Meliorism.

By Dr. PAUL CARUS.

PRICE 10 CENTS.

Being a critical dissertation upon the principles of art in every phase of human expression.

MONISM AND MELIORISM.

By Dr. PAUL CARUS.

PRICE 50 CENTS.

Monism is defined as that unitary conception of the world which attempts to explain all problems from one principle, and Meliorism as that contemplation of life which rejecting optimism as well as pessimism, finds the purpose of life in the aspiration after constant progress to some higher state of existence; in a word, in perpetual labor towards amelioration. Monism represents the scientific, and Meliorism the ethical aspect of this philosophical system.

The author starts from Kant, points out the dualism in Kant's views and ventures to reconcile it in his monism. His own views are based on an inquiry into Hume's problem concerning the law of causation.

The appendix of Definitions and Explanations will be of special value to students of philosophical topics.

"The Week, one of the ablest papers on the continent."—*Descriptive America.*

ENLARGED AND IMPROVED.

"THE WEEK,"

A Canadian Journal of Politics, Literature, Science, and Art.

Published every Friday. \$3.00 per year.
\$1.00 for Four Months.

THE WEEK has entered on its SIXTH year of publication, greatly enlarged and improved in every respect, rendering it still more worthy the cordial support of every one interested in the maintenance of a first-class literary journal.

The independence in politics and criticism which has characterized THE WEEK ever since its first issue will be rigidly maintained, and unceasing efforts will be made to improve its literary character and increase its attractiveness as a journal for the cultured home. Many new and able writers are now, or have promised to become, contributors to its columns, and the constant aim of the Publisher will be to make THE WEEK fully equal to the best literary journals in Britain and the United States.

As heretofore, PROF. GOLWING SMITH will, from time to time, contribute articles. London, Paris, Washington, and Montreal letters from accomplished correspondents will appear at regular intervals. Special Ottawa Letters will appear during the sessions of Parliament.

THE WEEK in its enlarged form will be the same size as "Harper's Weekly," and the largest paper of its class on the continent.

THE

Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects

1. The Psychology of the Cell—Introductory.
2. The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.
3. The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition; Predatory Habits of Certain Animalcula.
4. Colonies of Unicellular Organisms.
5. Recrudescence of Proto-Organisms.
6. Recrudescence of Higher Animals and Plants.
7. The Physiological Function of the Nucleus.
8. Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instanced, apart from the author's original investigations, the researches of Balbiani, Claparède and Lachmann, Auerhas, Ribot, Heckel, Engelmann, Espinas, Pouchet, Weber, Pfeffer, Kent, Dujardin, Gruber, Nussbaum, Bütschli, Lieberkühn.

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Mr. G. F. Romanes, that the first appearance of the various psychological and intellectual faculties is assignable to different stages in the scale of zoological development.

Review of Recent Work of THE OPEN COURT. PSYCHOLOGY AND BIOLOGY.

- EXPERIMENTAL PSYCHOLOGY IN FRANCE. ALFRED BINET.....No. 74.
DREAM, SLEEP, AND CONSCIOUSNESS. DR. GEORGE M. GOULD.....Nos. 74 and 75.
BODY AND MIND; OR THE DATA OF MORAL PHYSIOLOGY. FELIX L. OSWALD, M. D.....Nos. 72, 75, 78.

M. BINET's entertaining sketch of the state of Experimental Psychology in France is the only direct and convenient source from which the reader can obtain a comprehensive idea of the contributions the author's country is making to this branch of mental science. The work of the psychologists in France is distinguished by its almost exclusive bearing upon the pathological phases of psychological phenomena. The greatest successes of MM. Ribot, Richet, Charcot, and others, have been in treating the *diseases of the mind*.

PHILOSOPHY.

- SENSATION AND MEMORY. EDITOR..... No. 74.
COGNITION, KNOWLEDGE, AND TRUTH. EDITOR.....No. 76.
MONISM AS THE FORMAL PRINCIPLE OF COGNITION. .No. 78.

In the two first discussions, the conditions and processes by which we start from the bare excitations of the sensory world and attain to knowledge, are unfolded. Sensation is the primal condition of all knowledge; the products of sensation are preserved and transmitted as psychological forms; the psychological law of this retentive power is memory, from which source are evolved the different branches and varied forms of human thought.

The last essay of this series shows that the constitution of the human mind naturally predisposes man for Monism. The unitary conception which the intellect seeks to formulate respecting all things brought within its range, is the inward proof offered to us of the correctness of the monistic philosophy. Monism is thus a subjective principle, informing us how to unify knowledge and make it potent.

- AXIOMS THE BASIS OF MATHEMATICS. DR. EDWARD BROOKS.....No. 76.
THE OLD AND THE NEW MATHEMATICS. EDITOR.No. 77.
A FLAW IN THE FOUNDATION OF GEOMETRY.
HERMANN GRASSMANN.....No. 77.

In No. 76, Dr. Edward Brooks of Philadelphia, takes exception to an editorial thesis that "mathematics is unfortunately constructed on axioms." To Dr. Brooks no other way of construction is possible. There exist "*first truths or axioms* which the mind has power to cognize," which are incapable of proof, and which every system, even though nominally rejecting them, nevertheless tacitly employs. The editorial answer to Dr. Brooks, in No. 77,

is based upon the principles unfolded in the series of disquisitions on "Form and Formal Thought," in Nos. 64, 66, 67, and 69. Axioms so called, *are the result of reasoning*, and not the basis of it; the laws of formal thought determine the correctness and necessity of a proposition; conformity, in every instance, with these laws alone makes a truth universal. The relations of actual, material space have thus universally coincided with the laws of a formal system of third degree, and hence the rigidity and finality of those relations. In the same number, a translation from Hermann Grassmann's "Theory of Extension" is presented; it contains the fundamental points of departure of the new geometry from the old. No English version of this epoch-making work exists. The discussion will greatly interest those who have given their attention to the philosophy of mathematics.

SOCIOLOGY AND ECONOMICS.

- HENRY GEORGE AND LAND TAXATION. WHEELBARROW.....No. 73.
SYMPTOMS OF SOCIAL DEGENERACY. MONCURE D. CONWAY.....No. 74.
MAKING BREAD DEAR. WHEELBARROW.....No. 78.

WHEELBARROW opposes Mr. Henry George and the doctrine of Land Taxation with proper regard for the truth contained in the distinguished economist's theories. Objection is mainly taken to the universal curative power that the advocates of Land Taxation claim for their remedy. In man's obedience to moral laws Wheelbarrow finds the only magic wherewith to change the face of society.

Much criticism has been elicited by the bare mention of Mr. George's economical doctrines—indubitable testimony of their popularity and strength. Letters have appeared in No. 79 and others will follow.

"Symptoms of Social Degeneracy," Mr. Moncure D. Conway finds to be not unfrequented even in American civilization. We are prone to emphasize the survivals of barbaric institutions in effete Europe, while overlooking the excrescences of our own body politic. Lynch-Law, literary piracy, corruption in administrative circles, are signs of the decay of an ethical system and the theology that protects it. Worst of all, these evils are not unaccompanied with attempts at palliation.

HISTORICAL AND CRITICAL.

- THE STUDY OF SANSKRIT. H. OLDENBERG.....No. 79.
ASPECTS, CHRISTIAN AND HUMAN. WILLIAM R. THAYER.....No. 79.

THE study of Sanskrit, upon which a series of articles commences with No. 79, is a department of historical research comparatively new. Prof. Oldenberg, one of the most eminent Sanskrit scholars of the present day, tells us in popular language the story of the origin, growth, and present state of Sanskrit research. This department of philological and historical inquiry has done more than any other towards the true interpretation of the early history, civilization, and religion of the Aryan peoples. Within less than a century results have been attained, of which former generations would not have presumed to think. The articles have been translated from the German.

Under the title of "Aspects, Christian and Human," Mr. W. R. Thayer maintains in lucid and earnest language that the influences and forces to which the great changes wrought in modern society must be attributed, have not proceeded from sources essentially Christian. These advances are distinctly secular and human in character. "Not the preacher, but the poet: not the politician, but the untrammelled agitator, men whose tongues were free, and whose hearts were fearless, have been the heralds and champions of better things."

SENSATION AND THE OUTER WORLD.*

BY ALFRED BINET.

ALTHOUGH the subject that I propose to discuss may be regarded as belonging to the province of metaphysics, I do not conceive that this circumstance is a sufficient reason for not entering upon it. I am aware that many eminent psychologists, at the present day, profess a profound aversion for metaphysics. I do not share their aversion. In the first place, I deem it highly improper to limit arbitrarily the field of research, under the pretext of excluding metaphysics. Investigators ought not to erect posts in the domain of science, bearing notices of "no trespassing here." People have never gone so far as to say to physicists, to chemists, or to physiologists: That subject is forbidden you, do not touch upon that problem! Why then do they limit the freedom of the psychologist?

Moreover, it is not enough to set boundaries, it is necessary, at least, that the boundaries be fixed, so as not to give rise to disputes and litigation. Now who, I ask, can say definitely where metaphysics begins and positive science ends? As M. Charcot has recently remarked, with great aptness, we all of us perhaps, both observers and physicians, are metaphysicians without knowing it.

We are pleased to have seen these liberal ideas endorsed by the Paris Society of Physiological Psychology. Some four years ago we attended the organizing session of that society, of which we were a charter-member, and although the proceedings were not public, we believe we commit no indiscretion in telling what took place there. One of our most distinguished members maintained the proposition that we ought to add to the article of our constitution prohibiting in the usual manner discussions upon political and religious topics, a special clause prescribing with equal severity, discussions of metaphysical questions. This motion, it would seem, should have been favorably received by the Society, since at the first session, it was composed of none but physiologists and physicians. It is known that physicians, generally, have no weakness for metaphysics. Nevertheless, the Society protested unanimously, we may say, against the measure of exclusion proposed, and Metaphysics was not

proscribed. The adherents of liberalism in philosophy, upon this decision being given, applauded with both hands.

Having prefaced these remarks, I propose, without allowing myself to be diverted from my purpose by any mistrust of metaphysical speculation, to examine an extremely interesting question regarding the relations between sensation and its natural, normal excitant, the external object. This subject, it seems to me, has not been thoroughly elucidated, and though I make no pretension whatever to settle the question in a definitive manner, I believe that a few instructive considerations can be presented upon different points.

I.

FIRST, to attain clearness, let us define several of the terms that we shall have to employ; and to that end we may numerate in brief the various phenomena that we propose to study. Suppose that, my eyes being closed, I lay my hand upon my table, and that I feel a pin rolling about beneath my finger; I experience a sensation of a tactile kind, which excites in me a series of inferences, conscious, sub-conscious, and unconscious, and the whole occurrence is comprised in the following judgment: I touch a pin. In this way, through external perception, we possess knowledge of objects by the sensations they produce in us

Sensation is generally described as if it were produced directly by the contact of the external object with our organ of sense. But, manifestly, this is erroneous. When an object excites in us a sensation, it accomplishes this through the intermediary agency of our nervous system. The pin rolling about beneath our fingers first irritates the corpuscles of touch that lie disposed beneath the skin for the reception of tactile excitations. Thence the excitation travels through the nervous fibers, called the sensitive nerves, that lead to the spinal marrow; having reached the marrow, the excitation ascends by following the posterior ramifications of that organ; it traverses the bulb, follows the cerebral peduncles, penetrates into the *corona radiata* of Reil, and finally gets into the gray cortical matter of the convolutions of the brain, which is probably its final place of reception. At that instant the conscious sensation is produced. In order to be exhibited, it is necessary that the peripheral excitation traverse all

* Part of an unpublished essay upon "External Perception," rewarded by the *Académie des Sciences morales et politiques*.

these successive stages, which even now we know so imperfectly. If the path followed by the excitation is interrupted at some point, if the nerve, for example, is severed, if the spinal marrow is interrupted by transverse myelitis; if, in fine, for any cause whatsoever the excitation does not get as far as the brain, there is no sensation, no perception.

It follows from these extremely simple facts (which, notwithstanding their simplicity, I have deemed it profitable to recapitulate), that there occurs between the external object—the pin for instance—and our tactile sensation, an intermediate phenomenon; that phenomenon is the excitation of the nerves. We are in complete ignorance as to what that excitation is, but we are certain of its existence. Accordingly, that which has produced our sensation of a pin, is not *directly* the pin; it is the nervous modification which that object has produced, in acting upon our sense of touch; our sensation succeeds this nervous modification, it expresses to a certain extent its character, and in all instances the perception of an external object is reduced to the perception of the alterations which that object provokes in our nervous fibers and nervous centers.

If things take this course, we see at once what the result is. Nothing resembles less the external object than the excitation it propagates in our nervous substance. What resemblance is there, for example, between the head of a pin that lies beneath my finger, and the physico-chemical phenomenon that traverses the sensitive fibers of my hand and, passing through the spinal marrow, reaches my brain, where it gives rise to the conscious perception of a pin. Plainly, here are phenomena entirely dissimilar. It follows, therefore, that if there is a fact, at the present day, firmly established, it is that the sensations we experience upon contact with external objects are in no particular the copy of those objects. There is nothing outside of my eye that is like color and light, nothing outside of my organ of hearing that is like noise or sound, nothing outside of my sense of touch that is like hardness or softness or resistance, nothing outside of my sense of smell that is like a perfume, nothing apart from my sense of taste that is like a flavor.

Is a direct proof of this asked? A very simple illustration will serve. Take an electrical excitation. Bring it to bear upon any one of the senses. We will see that this excitation, which in itself is always the same, will produce entirely different effects in each separate organ of sense. To the eye it will be a flash of light; to the hearing, a crackling sound; to the touch, a light shock; to the taste, a metallic flavor; etc. These are facts now admitted by all physiologists and philosophers. They may be summarized in the remark of Helmholtz, that sensations bear no resem-

blance to their objects and are simply signs committed to the interpretation of the mind.

It would be incorrect, however, to imagine that all scientists have renounced the idea of similarity between what the consciousness perceives and what exists outside of our organs of sense—between the sensation and the object. In theory, this erroneous notion is rejected; but in point of fact we encounter it everywhere; only it has become more subtle and more refined than formerly, and I believe that it would be interesting to show how this exploded doctrine, this naïve and crude realism, that no longer ventures to show its face, has crept into many fundamental theories of physics, physiology, and psychology, and wholly invalidated them. But a thorough study of this question would require several articles; we must limit our discussion upon this occasion, and we shall accordingly content ourselves with examining the influence of the fallacious ideas just noticed, upon the physical theory of the external world.

II.

A GREAT many contemporary physicists and philosophers, Wundt, Hæckel, Huxley, Dubois-Reymond, have maintained the theory that the ultimate, absolute, definitive explanation of natural phenomena is a mechanical explanation, and consists in reducing these various phenomena to the fundamental concepts of motion and mass. Such, in the opinion of these authors, would be the ultimate bound of a scientific explanation; the scientist will have accomplished his task when he has succeeded in showing that every physical event is mechanical and consists in a transfer of motion between different masses.

Different authors—few it is true—have arisen against this doctrine, and have combated it by various arguments. Mr. Spencer, for instance, has endeavored to show that we are implicated in an alternative of absurdities, the moment we suppose that the effect that manifests itself to us as motion, is in itself that which we conceive as motion.*

More recently, Mr. Stallo has observed, that all the properties of matter imply a relation between two things; they exist only in relation with and in dependence upon a second object which receives the action. And so, we cannot speak of the properties of light, for instance, as belonging absolutely to it; apart from like considerations applying to all the other objects supposed to be representable in the sensations of the human eye. Therefore, it follows, the knowledge we possess of nature, resting upon observed relations, cannot pretend to an absolute character.

These several objections appear to us quite correct; but there is one which the authors mentioned

* First Principles, § 17.

have forgotten, and which, in itself, is sufficient to destroy the definitive character that it has been desired to ascribe to the mechanical theory of phenomena. This objection is expressed by saying, that the mechanical theory has failed to recognize the purely subjective nature of our sensations, and has sought to give them an objective stamp, thus committing a lamentable error which, as formerly remarked, may be pronounced a naïve realism. It is indeed with profound astonishment that we find so many physicists still adhering to that crude realism which, since the time of Berkeley, is no longer discussed.

Examine, for instance, the hypothesis of ether vibrations, by which modern physicists explain phenomena of light. Physicists believe that these vibrations actually exist outside of our sensory organs and take place in an elastic medium called the ether, with an amplitude, direction, and velocity determined by computation. They come to explain, in this way, how light added to light, in certain cases, can produce darkness. The phenomenon is to be attributed to an interference, that is to say to a state where the ether molecules, acted upon simultaneously by equal forces and from contrary directions, are held in equilibrium.

The fallacy of this explanation is immediately seen. It consists in transporting into the external world, into what Kant calls the world of noumena, mechanical phenomena that we see realized in our observations and which accordingly consist of phenomena of sensation. What, pray, is a vibration? How do we perceive a vibration? We have, here, a simple sensation, either visual, tactile, or muscular; the sight of a vibration, for example of a pendulum vibration, is just as much subjective as the sight of a color or the taste of a dish; the vibration in the form it appears to us, being a pure sensation, cannot reproduce exactly that which takes place in the external object; it is not the copy of the external object.

Accordingly, the mechanical theory of light, if it be not regarded as purely symbolical, and is taken in its literal significance, attributes as the cause of our sensations of light, phenomena that are known to us only through other sensations of light:—a theory that explains sensations by other sensations.

To avoid this fallacious reasoning in a circle, it suffices to take the mechanical theory of light for just what it is. It is not an explanation of the laws of light; it is not a representation of the external phenomena, necessarily unknown, that produce our sensations; it is a simple translation of a certain number of sensations into other sensations that seem to us more precise. But we shall recur directly to this point. For the present, let us proceed with our work of criticism.

III.

SIMILAR considerations may be presented respecting the physical theory of sound. We see by direct observation in this instance, and not by mere hypotheses, that sound is produced by a vibratory motion of the air, or of any medium through which it is propagated. Scientists, accordingly, have not failed to attempt an explanation of our auditory sensations by air vibrations communicated to our auditory apparatus.

This erroneous explanation has been given by a great many authors. To illustrate, I shall cite the following passage taken from a work of Blaserna upon Sound and Music. "Observe," says that physicist, "that vibrations are something objective; they exist in the sounding body, exterior to man. Sound, on the contrary, is produced in our ear; it is a subjective phenomenon. It is permissible to conclude, accordingly, that the vibrations are the *cause* and the sound the *effect* produced upon our hearing, or, in other words, that sound is the result of certain vibrations of bodies."

The reader will have no difficulty in remarking the error committed in this citation. The vibration of the sounding body, being known to us by sensations, has no more objective value than the auditory sensations. Sound can no more be explained by vibration than vibration by sound. All that can be said is, that what for the eye, the touch, and the muscular sense is a vibratory motion, is for the ear a sound. It may be added that physics simply establishes constant relations between certain qualities of sound: such as pitch, intensity, and timbre, and the amplitude, number, and form of the motions. But to go beyond that, is impossible; while it is chimerical in the extreme to regard the vibration of the sounding body as the cause of the sound. That cause we cannot know, because we cannot pass beyond the boundary of sensation. It is possible, that when we perceive a sound, a peculiar phenomenon occurs externally to us, which, when exciting the retina, produces the appearance of a vibratory movement, and when exciting the organ of hearing, produces the impression of sound; but whatever it be, it must be added that this external and inaccessible phenomenon is in its nature distinct from the two effects it produces in us.

To sum up, and not further to extend the discussion, I believe that physicists are wrong in seeking to explain natural phenomena by phenomena of motion, by a system of forces, or by properties of atoms; for the ideas that we can form of motion, force, and atoms, are constructed by the instrumentality of purely subjective sensations and give us no light whatever as to the nature of the external world.

IV.

BEFORE concluding this study, I must say a few words relative to a highly interesting question that

arises. It is incontestable that observers find an incalculable advantage in substituting, in their investigation of phenomena, the analysis of one of their sensations for the analysis of another. Acoustics, for example, would have yet made little progress, if it had been strictly limited to the investigation of sound sensations. That it has attained its present state of advancement is due to its having systematically studied sound under the aspect of motion, instead of having considered it under its acoustical aspect. The physicist has substituted his eye for his ear; and the study of vibratory motions, which entirely escape the ear and which the eye is able to grasp, has served as the foundation of acoustical science.

Furthermore, this is not the only instance where we remark that great advantage may be derived from substituting one sense for another. Generally, in scientific research, the eye alone officiates, and great numbers of instruments are designed to translate a mechanical, acoustical, or thermal phenomenon, into a phenomenon of sight; such, for example, is the thermometer, which enables the eye to measure temperature with much greater delicacy than could be done by the sense of touch.

There are certain circumstances, even, in which a visual sensation is replaced by a visual sensation of another kind. The graphic method is an instance of this. A muscular contraction may be studied in two different ways. First, by contenting one's self with simply observing the movement of the member, the protuberance of the muscle beneath the skin; and secondly, by employing the graphical method, which inscribes the phenomenon, upon paper, in the shape of a curve. In both cases, the observer is informed of the phenomenon by a visual impression. But if the observer rests satisfied with merely viewing the active member, he sees little; he establishes, in the most favorable cases, simply the protuberance that the contracted muscle produces in the contour of the member. On the other hand, when he has before his eyes the curve of contraction, he has the *measure* of the phenomenon; he sees the height of contraction, its period, the shape of the line of ascent and descent, and a number of other details.

Similarly, in the study of an acoustical phenomenon, if the physicist prefers the visual sense to the auditory sense, it is because the visual senses furnishes him with more precise results than the sense of hearing. Through the eye, a person grasps a motion; having registered that motion, a person sees its form, its extent, its velocity. These are exact data, capable of being measured and susceptible of introduction into computation. The sensation of sound, on the other hand, is a state of consciousness difficult to measure; this is why it is neglected.

The supremacy ordinarily accorded the visual sense over the other senses seems to be due not so much to the peculiar nature of visual sensation as to the presence of an exceedingly important element here involved. That element is extension. The testimony of the sight is employed to measure phenomena made known by other sensations because the intervention of sight reduces the operation to a measurement of an extended object, that is to say, virtually to a question of mathematics.

All human sciences hitherto developed, are visual, tactile, or muscular sciences; wherein all the phenomena of nature are brought within the notion of extension. A purely auricular science, founded wholly upon sensations of sound, has never yet been constructed; although auricular æsthetics is at the present time highly developed and exceedingly rich in point of complexity.

Still, it is not impossible to conceive of a science purely auricular; and in order not to remain in the dark upon the question, I shall confine myself to citing a very simple example, which will show that the ear can do the rule of three. If some one, for instance, were to propose the following problem to me: I have bought three dozen eggs for three dollars and twenty-five cents what is the price of an egg,—I believe that I would be able to solve that little problem without employing figures, pencils, and paper, but simply by recourse to my sense of hearing.

A rule of three can be put in the form of an equation, thus:

$$\frac{a}{b} = \frac{c}{x}$$

and we know by means of what algebraical operations we can determine the value of x , when the values of a , b , and c are given. This method belongs to what may be designated visual science. But it is possible, we maintain, to proceed differently, by resorting simply to the science of hearing.

Let us take a seat before an open piano. If we strike two notes successively that stand in the relation of a to b with respect to the number of vibrations, and if thereupon we strike a third note that stands to the first in the relation of a to c , our ear will naturally find the fourth note which will be to c as b is to a . Thus, when one has sounded successively the *do* and *mi* and then the *do* of the following octave, the ear will spontaneously indicate the *mi* of the second octave.

Any one who has a tolerably exact ear, can make the experiment and solve the problem. Three notes being given, a person by allowing himself to be guided by the quality of the sound, is able to find a fourth note which stands to the third in the same relation as the second to the first. Persons having a very exact ear and able to distinguish a fifty-fourth of

a semitone, will solve the problem with perfect exactitude. On the other hand, those whose musical sense is not so highly developed, will commit slight errors.

I insist upon the principle of the operation and not upon its applications, which are of slight importance to me. I do not desire to investigate the degree of complexity that it is possible to attain in this direction. I do not know whether it would be possible to convert the piano into a machine for computation. I have simply wished to show that by allowing ourselves to be guided by the quality of sound sensation, we are able to solve numerical problems.

It is, I hold, the mere quality of the sensation that serves us in such experiments; the mind in no wise fixes upon the number of the vibrations, which, furthermore, the ear is incapable of perceiving; it is the pitch of the note that is utilized in solving the rule of three.

These considerations, despite their insufficiency, show us that the sciences actually existing, sciences founded altogether upon extension, cannot furnish us the measure of the possible sciences nor even of the sciences of the future. We do not know what futurity has in store for us. But it is probable that it will transform our sciences and our conception of the world, as it will transform our organs.

PARIS, February, 1889.

FORM AS REALITY.

M. ALFRED BINET presents in his essay "Sensation and the Outer World" the idealistic view of the subject. Mr. E. C. Hegeler in his article, "The Soul," (published in No. 15 of THE OPEN COURT,) places himself on the standpoint of Realism. He explains the problem by a transfer of motion in a special form. We here reproduce the following paragraphs:*

"Feelings are of different intensity, as one pain is stronger than another. Single feelings may be of longer or shorter duration, and between them there may be definite intervals of time. Feelings also differ among themselves as various tastes or odors, or as those accompanying different musical notes.

"I imagine to have two phonographs, and a speech recorded on the tin-foil of the one; in the other the tin-foil is blank. The geometrical line imagined as resulting from a longitudinal section of the scratch in the tin-foil is the analogue to the speech. Both phonographs are turned at the same time. The scratch in the tin-foil of the first speaks; a similar line is made in the tin-foil of the second. Both now have the same geometrical line. What has taken place between them during the operation? Energy, coming formless, or rather uniform, from my arm-muscles in

turning the phonograph, passed through the air in vibrations corresponding to the geometrical line in the tin-foil of the first phonograph and was received by the second, producing the same geometrical line in its tin-foil. Is not that what we call form in the undulating geometrical line intimately associated with energy in these vibrations?

"In this way I speak of the feelings I have on hearing a melody, as corresponding to the geometrical form of the line in the tin-foil of a phonograph that records it."

HONEST AND DISHONEST WAGES.

BY WHEELBARROW.

I SAID a few days ago that although my wages had nominally increased from twenty-five to fifty per cent. in the last thirty years, it had not swollen in proportion to the cost of living, and that I find it harder to live now than in 1859. I acknowledge myself a little confused and doubtful about it, since a great Chicago editor has contradicted me in his testimony before the Senate Committee on Education and Labor. He assures me that I entirely mistake the cause of my poverty; that it is not because I do not get wages enough, but because I don't save what I get, but squander it in luxury, and tobacco, and beer. Well, if I should save all of it, and never spend a cent, it would take me more than a thousand years to become as rich as that editor; therefore, I prefer the evidence of my own home and my own pockets to the opulent moralizing of this economical philosopher. In his tenderness for the workingman, he travels all the way to New York to impress upon the committee the prudent maxim of one Dr. Benjamin Franklin, that "a penny saved is a penny earned."

This editor is one of those philanthropists who pay fifty cents for a dollar's worth of work, and make up the balance in good advice from Poor Richard's almanac. The question is not what we do with our money, but do we get what fairly belongs to us? As for beer, I have never read any more glowing tributes to the virtues of it than I have found in the editorial columns of that very editor's newspaper. No doubt it would be a good thing if all poor men would abandon beer, and it might be a good thing too if all rich men would take the pledge of Sir John Falstaff to "eschew sack and live cleanly," but this is a matter of morals and prudence to be decided by the freewill of each person for himself, rich and poor alike. It is not a question of wages. In the inventory of the great qualities of a certain President of the United States I find recorded his boundless capacity for champagne. I think it would have been better for him if he had never drunk champagne; but that is no affair of mine. Mr. Editor will not be allowed to confuse the wages question with the

* See THE OPEN COURT, pp. 393, 394.

beer question, for each must be discussed on its own merits, and decided by itself.

Speaking for myself, I have long since abandoned the use of beer, and all other intoxicating drinks; first, because I couldn't afford to buy them, and secondly, because I am stronger and healthier without them. As for tobacco, I am still undecided as to whether its use is hurtful or beneficial. Of course cigars are beyond my reach, but a pipe of tobacco has a soothing influence upon me, and the expense of it is nothing in comparison with the solace it brings. I have a fancy that to a certain extent it has the virtue of appeasing hunger. No doubt a doctor could easily show me that I am wrong in this opinion, but I have always noticed that whenever I have abandoned the use of tobacco I have been hungrier than I was before, so that I really believe the cost of it is more than balanced in the saving of bread. It may be replied to this that smoking must therefore be injurious, as it weakens appetite, but this is no argument in my case, because of all human blessings a good appetite is the smallest benefit to me. I have no use for it. I can stand the expense of tobacco much better than the expense of a good appetite.

But I began to write about wages, and have permitted that editor to switch me off to the side-track of beer. I said that I was getting a dollar and a half a day. That's what they tell me I get, but I have my doubts about it. Do I really get it? Last week I earned nine dollars exactly—nine silver dollars. I spent them for groceries; did I get nine dollars' worth? I suspect that I did not. I believe I was cheated in the weight of the dollars, but I am quite sure that the grocer didn't cheat himself in the weight of the groceries, and I fear that I only got in goods the value of the silver in the dollars that I paid for them. They tell me that the quantity of silver in a dollar is worth eighty cents in gold, and no more; if so, then my wages is only one dollar and twenty cents a day in gold. This is a frightful discount, and it goes far to explain the reason why my dollar and a half a day is not so much to me as a dollar a day was in the olden time, because the extra twenty cents is not half enough to cover the extra cost of life.

I suspect that this twenty per cent. on our wages is a tax upon labor, which goes all into the pockets of capital—a tribute to monopoly—every dollar of which is profit. I believe that this twenty per cent. furnishes the capital stock of all the national banks in the country, and that it largely contributes to the unjust distribution of wealth, which is the reproach of our statesmanship, and a menace to the life of our institutions. It widens the social difference between the rich man and me until we scowl at one another—I at him with envy, and he at me with fear. It is making

castes and class distinctions in this country that some day will come together with a crash like thunder, as they did in France in 1789. A dollar and a half a day in silver for me, and ten thousand dollars a day in gold for Mr. Vanderbilt, is illogical in a state of society pretending to recognize the equality of us both; it is the illegitimate offspring of capital and polluted law. I must have more and he must have less, or the strained ligament that holds society together will break. Not by confiscation, nor by physical violence, will the change come—at least in our day—but it will come that way in the next generation, unless the moral forces now at work shall establish capital and labor on a more friendly and equitable basis, unless our social system shall be arranged on juster principles, insuring a fairer division of the profits of labor between the employer and the employed.

I mentioned my suspicions about the silver dollar to a friend who understands monetary science better than I do, and he assured me that my argument was all unsound, because based on the fallacy that dollars of different metals were of unequal value, and the additional fallacy that if I should not be paid in the cheaper metal I should be paid in the dearer one at the same rate of wages. He told me that all dollars are of equal value by decree of Congress. He proved his case by the practical test of a dollar's worth of sugar, which was the same in quantity, whether paid for in paper, or silver, or gold. As he brought the proof of his argument to actual demonstration, I was compelled to yield, but I was not satisfied, although the concrete evidence of a dollar's worth of sugar was palpable as a church or a barn.

I learn by object lessons when I learn anything at all, because my mind soon tires with metaphysics and abstract reasoning. In that way I tried to solve the puzzle by the actual experiment of a silver dollar which I paid out the other day for coffee. It was a bright, good-looking dollar, with stars and other national emblems upon it to give it character, and the positive statement that it might be depended upon as "one dollar." If any suspicion of short weight, or fraud, or adulteration attached to it, such suspicion immediately vanished on the discovery that it was a religious dollar, inscribed with the legend "In God We Trust." Not to trust in a pious dollar such as that would be to lack faith like an infidel; but, after all, I believe that it did not buy me a dollar's worth of coffee. As I walked over to the store I said to myself: "Does it make any difference whether this coin is called a dollar, or a florin, or a doubloon? Will it buy me any more coffee than the worth of the silver in it? The grocer buys his coffee in Brazil, and he pays for it in gold; if this coin is worth eighty cents in gold and no more, I can get eighty cents' worth of coffee

for it, and no more; unless the government steps in and agrees to make up the difference between the value of the cheap dollar and the dear one. If the eighty per cent. dollar and the hundred per cent. dollar have equal purchasing power, it must be because in some way or other the government promises to redeem the cheaper coin. Unless this promise of redemption can be found somewhere in the fiscal machinery of the government, I could not possibly get more than eighty cents worth of coffee for my silver dollar. There is no political economy in the world that will convince me that the grocer could afford to give me any more. I know that Aladdin gave a new lamp for an old one, and got the best of the bargain, but that was an exceptional case, the only one in history. Similar good luck is not likely to happen in our day. The transmutation of metals has not been done yet, and until it is done we need not expect to buy a hundred cents' worth of coffee for eighty cents' worth of silver. I think I am cheated in the dollars I get for my work.

THE ONENESS OF THE PHENOMENAL AND THE NOUMENAL.

WHAT we call things, what we call our personality, our Self, our Ego, are merely abstract concepts that we have formed for the purpose of distinguishing them from other things. Words serve the practical purpose of orientation among the innumerable phenomena of nature. Absolutely considered, and independent of their properties, things neither exist, nor do we ourselves. Properties are parts of a thing, abstracted from it in thought. Some, and in fact very many, of these properties are only separable in thought, and not in reality, from things; while the totality of all properties constitutes the thing entire. Most of the words, by which we designate things, are furthermore shifting concepts. We retain the same word, even when parts or properties of a thing, it may be, have fallen away or when new ones are added. The rose-bush in the garden continues the same rose-bush, even after we have engrafted another species into its stem; it has merely lost certain properties and acquired new ones. A hat without a band and trimming is still a hat, and an old hat with a new band and new trimming continues to be the same hat to us. Only when the change made is very great do we cease to designate the object by the old name.

We ourselves remain ourselves, although continually changing, in body as well as in mind. Of our world of ideas, various parts fade away, or are wholly forgotten, while with new experiences new thoughts continually grow from the old ones.

In order completely to understand a thing, we must know it in its relation to other things. The character of a table is constituted not only by its shape, but also

by its purpose to serve people as a table. Without this purpose, properly considered, a table would *not* be a table. A stone, for instance, that has been accidentally shaped into the form of a table by the grinding action of a glacier, is no table. The surroundings in which a table serves the purpose of a table, thus belong to the table as a property which we cannot separate from it. We must learn to understand everything, therefore, not as the expression of something having a separate, absolute existence, that lies concealed behind its realities, but as a part of the All.

Our bodies, of themselves, and apart from all else, would not be able to exist. Without the pressure of the atmosphere, we would burst asunder, while the air surrounding us belongs most intimately to our lungs. A recent scientist has called the kitchen an extension of our chewing and digesting apparatuses. And correctly. But also the fields upon which grow the corn that miller and baker convert into bread for us, belong to our Selves. In reality, the whole world is a part of our being, and the manifestation of our existence is conditioned wholly by the relations in which we stand to the outer world.

This holds good not only of our physical, but still more so of our spiritual existence. Our soul is made up of perceptions and ideas. The objects of our perceptions and our thoughts acquire thereby a relation to our Self; they become parts of the Self, which in the event of a change also transform the corresponding parts of the Self.

The closer the connection is in which a thing stands to us, the more it appears as a part of our being. The skilled violin-player feels his violin, as though it were a part of his body. He controls it, indeed, as an acrobat does his limbs. A benumbed limb which no longer pains, on the contrary, appears as a foreign body that does not belong to us. The captain of a company conducts his troops, as an engineer controls his engine. The engine becomes a part of the engine-driver, the company a part of the captain, and the audience a part of the speaker. Everything it is true, rests upon reciprocity. The speaker in his turn is a part of the audience. Language is the bond of union; in language speaker and audience are one. The speaker must speak the language of his audience, and the audience must understand the language that he speaks. So the engineer is part of the locomotive and he must be familiar with it; in other words, a picture of the locomotive must exist as a living nerve-structure in his brain.

Although we are, in fact, distinct individuals, distinguished from each other by an "I" or a "you," by a "he" or a "she"; yet when closely scrutinized, the "you" of our friends and enemies is a part our own Self. In every way the "I," "you," "he," "she,"

and "we" are parts of a great whole; and human society with its social and political institutions, with its ethical ideas and ideals, is only possible because these "you's" are but little distinct from the "I's." That our life and property in general is safe, that we buy and sell, marry and are given in marriage, that the laws are observed, and that in ordinary circumstances we hold intercourse with one another mutually trusting in our honest intentions; that, too, we struggle and compete with one another and try our best to maintain our places in the universal aspiration onward:—all this is only possible because we are parts of the same humanity and the children of the same epoch, possessing the same ideas of right and wrong, and bearing within ourselves in a certain sense the same souls.

Could some evil spirit, over night, change our souls into those of savages and cannibals, or even into those of the robber-knights of the middle ages, all our sacred laws, all our constables, all the police power of the State would be of no avail: we would inevitably sink back to the state of civilization in which those people existed. But could a God ennoble our souls, so that the sense of right and reason became still more purified in every heart, then better things would result spontaneously and much misery and error would vanish from the earth.

* * *

AND the God that can accomplish that, lives indeed—not beyond the clouds, but here on earth, in the heart of every man and woman. An absolute God exists as little as an absolute soul or an absolute thing. We no longer believe in ghosts, and an absolute God, just as an absolute soul is not distinguishable at all from a ghost.

By God we understand the order of the world, that makes harmony, evolution, aspiration, and morality possible. This God is no transcendental thing, existing of itself, enthroned above the clouds; he is immanent, and lives in the hearts of men as their good-will, their honor, their conscience, their ideal, or however else we may please to distinguish it.

The belief in a transcendental God, from lack of clearer ideas, long served our forefathers to symbolize this immanent God. Therefore we will not vilify the old views; they after all contain a great truth. We shall treat them with reverence, notwithstanding we reject them. To us the idea of a God, absolutely existing, has become a superstition; but all the more have we thus come to know the meaning of the God we have abstracted from the reality of the world and from the life of our heart. In this sense, the Faust of Goethe speaks:

"The God that in my breast is owned
Can deeply stir the inward sources,
The God above my powers enthroned
He cannot change external forces."

The idea of a transmundane God, a God of itself, would be an attempt to create 'a noumenon in the positive sense,' (as Kant calls it) which is inadmissible. There is no reality corresponding to it. However, the idea of a God as the possible presence of a moral law in the world to which we have to conform, is a conception of pure thought which involves no self-contradiction. It would be (to use Kant's expression again) 'a noumenon in the negative sense,' the use of which is admissible and even indispensable for arriving at general conceptions. The idea of God in this sense, it will be found, has some realities corresponding to it, just as much as the quality of heaviness or weight corresponds to our conception of gravity. The God outside of the world is an anthropomorphism, and is as such a remnant of former ages. Monism leads us to the purer and loftier idea of an immanent God.

Goethe says:

"What were a God who from the outside stirred
So that the world around his finger whirled?
He from within the Universe must move,
Nature in Him and Him in nature prove.
Thus all that in him lives and moves and is
Will ne'er his power and his spirit miss."

Agnosticism believes that the substance of these spirits, things absolute, as well as their existence, is an inscrutable mystery of which we can know nothing. Monism goes a step beyond this. According to Monism, the division of the world into knowable things, as appearing in their operations, and into absolutely unknowable things held to exist behind or in phenomena, is an untenable and self-contradictory dualism. Monism rejects altogether the ghost-illusion of existence absolute, and constantly keeps in mind that every thing is a part only of the All, and that every natural process is only an aspect of the entire indivisible existence of the universe. We, too, are a part of the eternal All in which we live, move, and have our being.

CORRESPONDENCE.

DREAMS, SLEEP, AND CONSCIOUSNESS.

To the Editor of THE OPEN COURT:—

The scholarly article entitled "Dreams, Sleep, and Consciousness," which appeared in a late number of your paper, recalls a reminiscence of my own which seems to confirm Dr. Gould's opinion, that sensory communication may be had directly with (the organ of?) consciousness without connection or communication by means of the ordinary senses of preception. Perhaps Dr. Gould's theory of the manner in which this takes place may be modified by subsequent research, but the fact itself can scarcely be questioned.

Some years ago I was living in a California mining-town of several thousand inhabitants. The greater part of the town consisted of frame buildings packed closely together, offering the most favorable conditions for the rapid spread of fire, and the total destruction of the town, should fire once gain a headway. This fact was fully appreciated and several volunteer fire-companies were equipped by the citizens. It is hardly necessary to say that every ear was alert for the clang of the fire-bell, and at its first sound there was an instant gathering of volunteers.

One night in midsummer, after I had been several hours in bed, my usually dreamless sleep was suddenly disturbed by a vivid dream of fire. I saw the flames break out from the roof of the building, and, in my dream, ran to the engine-house and pulled vigorously at the ropes that sounded the alarm-bell. The resulting clangor was so loud that it awakened me, but the sound which I heard in my dreams was not a dream-fancy,—it was the actual ringing of the bell and my first act of consciousness was the perception of this fact.

Now, it is incredible that a chance dream of fire could have occurred at such an opportune moment. Such a coincidence is, of course, possible, but as improbable as the chance coincidence of certain Fraunhofer lines with the spectrum of iron. It is far more reasonable to suppose that the strokes of the bell reached my consciousness first by some other channel than the auditory nerves. The vibratory impact aroused consciousness,—perhaps imperfectly, but still more faithfully than in the case of Dr. Gould and his Thomas cat. In the latter case consciousness was lured into the belief that the discordant caterwauling was the sweetest of music; in the former, there was no deception. The first alarm struck upon my consciousness was the alarm of Fire! In this instance consciousness was in the wrong as to locality and surroundings—for while the dream-fire was consuming the school-house on the hill, the real fire was in an unoccupied building some distance away—but it was not deceived as to the fact.

Dr. Gould mentions also another peculiar feature which perhaps may be reckoned among dream-phenomena—namely, the dream of impending danger which leads to the conscious necessity of awakening. This condition, which is usually brought about by an interruption of the function of some nerve-trunk is one of which most people have an experience at some time or other in life, and all who have passed through it can bear testimony to the energy spent in rousing the body into action. Dr. Gould premises his description of this phenomena with the statement that he lies prone upon his back and then says he can at first move only one or two fingers, or perhaps sway his head. In my own experience, while the general conditions are the same, the manifestations are different. I invariably sleep on my side, and in the process of awakening, begin by moving the foot of the upper limb. I am not able to move head or hands in the least, and the reason is the same as in Dr. Gould's case. The stimulation of the motor nerve-centers, although to consciousness the result of a tremendous expenditure of energy, is but a slight one—hardly more than sufficient, in fact, to perform its work. Directed by consciousness, it must therefore exert its effort in that part of the body, which, because of its position, is most easily moved, or in the least constraint of position.

In both of the instances noted, the facts show that consciousness may act and react without the intermediation of the lower centers. In the case of the fire-alarm, consciousness was aroused and received a message through the sensory fibers; in the nightmare it was on the *qui vive*, putting forth almost superhuman efforts to stimulate the inert and irresponsive motor centers into action.

J. W. REDWAY.

SCIENCE AND WORSHIP.

To the Editor of THE OPEN COURT:—

THE whole field of inquiry seems to me capable of being embraced in this sentence, *i. e.*, nature exists; what are its component parts; what is the action of the parts separately and collectively? This, science devotedly investigates; but when some rashly jump to the conclusion that Nature, having parts *x*; and the parts, action *y z*; therefore Nature is not created by God; is there not a manifest non-sequitur? To me it seems so (I am not in any sense one of the scientific circle, but only an amateur student of philosophy). Then the question also arises how did blind Nature

change the mode of producing life—there must have been a first life, therefore but one life even on the atheist's hypotheses? How came it, then, that life is now produced by the sexes? Now Jesus Christ does not say "Come all ye men of learning and I will demonstrate the doctrine of the Holy Trinity." So say Aristotle, Plato, and all human philosophers, with regard to their doctrines. But Christ says; I am God the Creator and Sovereign Lord of Heaven and Earth and therefore I require, command under penalty, that you shall believe My Word. The issue is then simple and direct. Christ is God; or He is a fraud.

There is just as much, and more, opportunity of displaying profound learning in praising God through His works as there is in bluntly opposing God. There can be no conflict between reason and the revelation once delivered to the saints.

Yours truly,

LINCOLN, NEB.

MICHAEL CORCORAN.

[Concerning 'the idea of God' and its relation to Nature, we refer the reader to the editorial of this number and to the pamphlet "The Idea of God" (OPEN COURT PUBLISHING CO.).

If Christ had spoken as is quoted above, it is more than doubtful whether he would ever have been worshiped as a savior. Christ said according to Matthew xi. 28: "Come unto me, all ye that labor and are heavy laden, and I will give you rest."—Ed.]

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXIII.

CÆSARIAN INSANITY IN THE HUMMEL FAMILY.

MR. HAHN was walking by the side of his garden fence, his soul filled with gratitude; but as this was prevented from escaping through the usual outlet of friendly speech, it compelled him to take refuge in those chambers of his mind in which he kept the plans for the beautifying of his garden. His noble-hearted opponent was about to celebrate his birthday; this Mr. Hahn discovered in a roundabout way. On this day he might perhaps be able to show him some secret token of esteem. The greatest treasures in Mr. Hahn's garden were his standards and bush roses of every size and color,—splendid flowers which bloomed almost the whole year, and were much admired by the passers-by. They were all in pots. These roses he determined to dedicate as a quiet mark of homage to Mr. Hummel.

This thought occasioned Mr. Hahn happy hours. The park-keeper, whose house stood at the limit of the city by the river, had a little boat; this Mr. Hahn borrowed secretly for a few hours in the night. Before the early dawn of morning, on the birthday of his enemy, he slipped out of the house, rowed the pots in the boat to the small steps which led from the water-side into the garden of Mr. Hummel; he glided with his loved roses to the circular bed, arranged them noiselessly according to their numbers, planted each separately, and changed the desert spot into a blooming parterre of roses. When the sparrows in the gutters twittered out their first querulous abuse, he had smoothed down the earth in the bed with a small rake.

* Translation copyrighted.

He cast a look of pleasure on his work, and another on the still dusky outline of the house, within which Mr. Hummel still slept, unprepared for the surprise of the morning, and then glided with his spade and empty pots into his boat, rowed himself up to the house of the park-keeper, and concealed himself and his garden utensils on his own ground before the first rays of the rising sun painted his chimney with roseate colors.

Mr. Hummel entered his sitting-room at the usual hour, received with good-humor the congratulations of his ladies, looked graciously at the birthday cake which wife Philippine had placed with his coffee, and at the travelling-bag which Laura had embroidered for him, took his newspaper in his hand, and prepared himself by participation in the political concerns of men in general, for the business of his own life. When towards the middle of the day he returned from the office, and the Doctor entered his room to offer his congratulations, a dark cloud gathered on the sunny countenance of the master of the house, and lightning flashed from under his ambrosial eyebrows.

"What, Saul among the prophets! Are you come to fetch a lost ass back to your father's house? We cannot accommodate you. Or are you going to deliver a lecture upon the language of the orang-outang in the land of the cocoas?"

"My lectures have not caused you any trouble so far," replied the Doctor. "I have not come in order that your hospitable politeness should take the trouble to entertain those present by the outpouring of your good humor. I have already expressed to you my wish never to be the object of it."

"Then defend yourself if you can," cried Hummel.

"I am only prevented," replied the Doctor, "by consideration for those present from giving you in your own house the answer which you seem to wish."

"I should be sorry if you were placed at any disadvantage in my house," replied Hummel. "I propose to you, therefore, to put yourself on an equal footing with me, by remaining in your own house and putting your head out of the window. I will do the same; we can then sing out to one another across the street, like two canary birds."

"But as I am here now," said the Doctor, with a bow, "I claim to be allowed to eat this piece of birthday cake in peace among friendly faces."

"Then I beg of you to resign the sight of my face without overpowering sorrow," replied Hummel.

He opened the door into the garden, and went down the steps discontentedly. While still at a distance he saw the young group of roses smiling innocently in the light of the sun. He walked round the spot, shook his head, and invited his ladies into the garden.

"Which of you got this idea?" he asked.

The ladies showed such lively surprise that he was

convinced of their innocence. He called to the old storekeeper and the book-keeper. All showed entire ignorance. The countenance of Mr. Hummel became gloomy.

"What does this mean? Some one has slipped in here while we were asleep. Night garden-work is not to my taste. Who has ventured to enter my property without permission? Who has brought in these products of nature?"

He went restlessly along the side of the water: behind him followed Spitehahn. The dog crept down the steps to the water, smelt at a bit of brown wood which lay on the last step, came up again, turned towards the house of Mr. Hahn, and set up his back like a cat, mockingly, and made a snarling noise. It meant as clearly as if he had spoken the friendly words, "I wish you a pleasant meal."

"Right," cried Hummel; "the intruder has left the handle of the rudder behind. The brown handle belongs to the boat of the park-keeper. Take it over to him, Klaus. I demand an answer; who has ventured to bring his boat alongside here?"

The storekeeper hastened away with the piece of wood, and brought back the answer with an embarrassed air:

"Mr. Hahn had borrowed the boat in the night."

"If there are forebodings," cried Hummel, angrily, "this was one. This nocturnal prowling of your father I forbid under all circumstances," he continued, to the Doctor.

"I know nothing of it," rejoined the Doctor. "If my father has done this, I beg of you, even if you do not value the roses, to be pleased with the good intention."

"I protest against every rose that may be strewed on my path," cried Hummel. "First we had poisoned dumplings, with evil intentions; and now rose leaves, with good ones. Your father should think of something else than such jokes. The ground and soil are mine, and I intend to prevent roosters from scratching here."

He charged wildly into the roses, seized hold of stems and branches, tore them out of the ground, and threw them into a confused heap.

The Doctor turned gloomily away, but Laura hastened to her father and looked angrily into his hard face.

"What you have rooted up," she exclaimed, "I will replace with my own hands."

She ran to a corner of the garden, brought some pots, knelt down on the ground, and pressed the stems with the little balls of earth into them as eagerly as her father had rooted them up.

"I will take care of them," she called out, to the Doctor; "tell your dear father that not all in our house undervalue his friendship."

"Do what you cannot help," replied Mr. Hummel, more quietly. "Klaus, why do you stand there on your hind legs staring like a tortoise? Why do you not help Miss Hummel in her garden-work. Then carry the whole birthday-present back again to the youthful flower-grower. My compliments, and he must in the darkness have mistaken the gardens."

He turned his back upon the company, and went with heavy steps to his office. Laura knelt on the ground and worked at the ill-used roses with heightened color and gloomy determination. The Doctor helped silently. He had seen his father behind the hedge, and knew how deeply the poor man would feel this latest outburst on the part of his adversary. Laura did not desist till she had put all the flowers as well as possible into the pots; then she plunged her hands into the stream, and her tears mixed with the water. She led the Doctor back to the room; there she wrung her hands, quite beside herself.

"Life is horrible; our happiness is destroyed in this miserable quarrel. Only one thing can save you and me. You are a man, and must find out what can deliver us from this misery."

She rushed out of the room; the mother beckoned eagerly to the Doctor to remain behind, when he was on the point of following.

"She is beside herself," cried Fritz. "What do her words mean? What does she desire of me?"

The mother seated herself on the sofa, embarrassed and full of anxiety, cleared her throat, and twisted at her sleeves.

"I must confide something to you, Doctor," she began, hesitatingly, "which will be very painful to us both; but I know not what to do, and all the representations that I make to my unhappy child are in vain. Not to conceal anything from you,—it is a strange freak,—and I should have thought such a thing impossible."

She stopped and concealed her face in her pocket-handkerchief. Fritz looked anxiously at the disturbed face of Mrs. Hummel. A secret of Laura's that he had for weeks foreboded was now to fall destructively on his hopes.

"I will confess all to you, dear Doctor," continued the mother, with many sighs. "Laura esteems you beyond measure, and the thought of becoming your wife—I must say it in confidence—is not strange or disagreeable to her. But she has a fearful idea in her head, and I am ashamed to express it."

"Speak out," said the Doctor, in despair.

"Laura wishes you to elope with her."

Fritz was dazed.

"It is scarcely for a mother to express this wish to you, but I do not know how to do otherwise."

"But where to?" cried the Doctor, quite aghast.

"That is the most painful part of all, as you yourself must acknowledge. What put the idea into her head, whether poetry, or reading about the great world in the newspapers, I know not. But to her frame of mind, which is always excited and tragic, I can oppose no resistance. I am afraid to impart it to my husband. I conjure you to do what you can to calm my child. Her feelings are wounded, and I can no longer resist the inward struggle for this young heart."

"I beg permission," replied the Doctor, "to speak immediately with Laura on the subject."

Without waiting for the mother's answer, he hastened up the stairs to Laura's room. He knocked, but receiving no answer, opened the door. Laura was sitting by her writing-table, sobbing violently.

"Dear, sweet Laura," exclaimed the Doctor, "I have been speaking with your mother; let me know all."

Laura started.

"Every warm feeling is rejected with scorn, every hour that I see you is embittered by the hostility of my father. The heart of the poorest maiden palpitates when she hears the voice of the man she loves: but I must ask, is that the happiness of love? When I do not see you I am in anxiety about you, and when you come to us I feel tormented, and listen with terror to every word of my father. I see you joyless and cast down. Fritz, your love for me, makes you unhappy."

"Patience, Laura," said the Doctor; "let us persevere. My confidence in your father's heart is greater than yours. He will gradually reconcile himself to me."

"Yes, after he has broken both our hearts; even great love is crushed by constant opposition. I cannot, amidst the wrangling of our hostile families, become your wife; the narrow street and the old hatred are destructive to me. I have often sat here lamenting that I was not a man who could boldly battle for his own happiness. Listen to a secret, Fritz," she said, approaching him, again wringing her hands; "here I am becoming haughty, malicious, and wicked."

"I have observed nothing of that kind," replied Fritz, astonished.

"I conceal it from you," exclaimed Laura; "but I struggle daily with bad thoughts, and I am indifferent to the love of my parents. When my father pats my head, the devil cries within me he had better let it alone. When my mother admonishes me to have patience, her talk secretly irritates me, because she uses finer words than are necessary. I hate the dog, so that I often beat him without cause. The conversation at the Sunday dinner, the stories of the old actor, and the eternal little tittle-tattle of the street appear insupportable to me. I feel that I am an odious creature, and I have frequently in this place wept over and

hated myself. These bad fits are ever recurring and become more overpowering. I shall never be better here: where we live under a curse, like two spoiled children. We sink, Fritz, in these surroundings! Even the loving care of parents ceases to make one happy—the anxiety that one should not wet one's feet, that one should wear woolen stockings, and have cakes and sugar plums on a Sunday—is one to go through all this every year of one's life?"

She hastily opened her journal, and held out to him a bundle of poems and letters.

"Here are your letters; through these I have learnt to love you, for here is what I revere in you. Thus would I always have you be. When, therefore, I think of what you have to go through between our houses and to bear from my father, and when I observe that you wear a double shawl under every rough blast, I become anxious and worried about you; and I see you before me as a pampered book-worm, and myself as a little stout woman with a large cap and an insignificant face, sitting before the coffee cups, talking over the daily passers by, and this thought oppresses my heart."

Fritz recognized his letters. He had long felt certain that Laura was his secret confidant, but when he now looked at the loved one who held up to him the secret correspondence, he no longer thought of the caprice which had occasioned him so much grief; he thought only of the true-heartedness and of the poetry of this tender connexion.

"Dear, dear Laura," he exclaimed, embracing her; "it seems as if two souls with which my heart had intercourse had become one, but you now divide me and yourself into human beings of daily life, and into higher natures. What has destroyed your cheerful confidence?"

"Our difficulties, Fritz, and the sorrow of seeing you without pleasure, and hearing your voice without being elevated by it; you are with me, and yet further off from me than in those days when I did not see you at all, or only in the society of friends."

She released herself from his embrace.

"Do you love me? and are you the man who has written these? If so, venture to withdraw me from this captivity. Begin a new life with me. I will work with you and be self-denying; you shall see of what I am capable; I will think day and night of how I can earn our maintenance, that you may be undisturbed by petty cares in your learned work. Be brisk and bold, cast off your eternal caution, venture for once to do what others may look at askance."

"If I were to do it," answered Fritz, seriously, "the risk would be small for me. For you the consequences may be such as you do not think of. How can you imagine that a rash determination can be good for you

if it throws fresh discord into your soul, and burdens your whole life with a feeling of guilt towards others?"

"If I take upon myself to do what is wrong," exclaimed Laura, gloomily, "I do it not for myself alone. I feel but too well that it is wrong, but I venture it for our love. Never will my father voluntarily lay my hand in yours. He knows that I am devoted to you, and is not so hard as to wish my unhappiness, but he cannot overcome his disinclination. One day he is compelled to acknowledge that you are the man to whom I ought to belong, the next the bitter feeling of how hateful it is to him again returns. If you venture to defy him you will do what is really agreeable to him; show a strong will, and, though he may be angry, he will easily be appeased by your courage. He loves me," she said in a low tone, "but he is fearfully hard to others,"

"Is he always so?" asked the Doctor. "It is clear the daughter does not know the full worth of her father. I should at this moment be doing both him and you an injustice if I were to conceal from you what he wishes to keep secret. Listen, then: when my poor father was sitting by me in despair, your father entered our house and gave us in the most magnanimous way the means of averting the threatened blow. Do you not know that his sulkiness and quarrelsomeness are frequently only the expression of a rough humor?"

Laura watched his mouth as if she wished to devour every word that fell from his lips.

"Did my father do this?" she exclaimed, startled to the utmost, raising her arms towards heaven, and throwing herself down upon her writing-table.

Fritz wished to raise her.

"Leave me," she entreated, passionately, "it will pass off. I am happy. Leave me alone now, beloved one."

The Doctor closed the door gently, and went down to the mother, who still sat on the sofa overwhelmed with anxiety, revolving in her mind, with motherly alarm, all the exciting scenes of an elopement.

"I beg of you," he said, "not to worry Laura now by remonstrances. She will regain her calmness. Trust to her noble heart."

With these wise words the Doctor endeavored to comfort himself. Meanwhile Laura lay supported against the chair, and thought over her injustice to her father. For years she had borne the sorrow which is bitterest to the heart of a child, and now the pressure was taken from her soul. At last she arose, drew out her diary, tore out one page after another, crumpled up the leaves and threw them into the fire—a small sacrifice. She watched it till the last sparks flickered in the dark ashes, then she closed the stove and hastened out of the room.

(To be continued.)

BOOK REVIEWS.

FIRST AND FUNDAMENTAL TRUTHS. A Treatise on Metaphysics.

James McCosh, D. D., LL. D., etc. New York: Charles Scribner's Sons. Chicago: A. C. McClurg & Co. 52.00.

The venerable and scholarly ex-President of Princeton has set forth, in this neatly printed volume, the metaphysical principles in which his Realistic Philosophy culminates. Our readers are presumably acquainted with the teachings of Dr. McCosh, and have had occasion to admire his clear and lucid style of presentation. Although the positions upheld in the present work are substantially the same as those advanced in the author's former publications, the arrangement of the theses and the development of the same are in this instance altered to conform to the plan of the book. The work, in the words of the author, is to be "regarded as the cope-stone" of what he has been able to do in philosophy. "I define Metaphysics," says Dr. McCosh, "as The Science of First and Fundamental Truths. I cherish the conviction that it may be made as clear and satisfactory as Logic, the science of discursive truth, has been, since the days of Aristotle. It shows us what we are entitled to assume and what we are not entitled to assume without mediate proof. It does so by opening to our view those primitive truths which at once claim our assent and furnish a sure foundation to all our knowledge; which, like the primitive granite rocks, go down the deepest and mount the highest. * * * There are Objects, there are Truths, which are perceived Directly and Immediately; this is not the case with the great body of our knowledge. * * * On the bare contemplation of these two straight lines we perceive that they cannot enclose a space, and on a surface being presented to us, that the shortest distance between these two points in it is a straight line. In order to convince us of these and innumerable such truths, we need no gathered experience, and we make no use of inference. * * * Our intuitions look to 'Things' and the Relations of Things. * * * Our intuitions look to single objects and not to abstract or general notions. * * * We can generalize our Intuitions and thus form Philosophic Principles. * * * Induction, by which is meant a Gathered and Systematic Observation, has a place in Metaphysics. This will seem to many an extraordinary position. It will be regarded by them as stripping philosophy of its crown and sceptre which place it above all the ordinary sciences. It seems to make our deeper thinking to have no other foundation than human observation, which must necessarily be limited. * * * If we would find what intuition is, we must carefully inspect it; not, indeed, by the external senses, which cannot perceive it, but by the internal sense, that is self-consciousness. Not only so, but we must seek a scientific manner to find out the objects which it looks at and makes known to us. In short, we have to construct the science of metaphysics by a process of inductive observation suited to the nature of the mental phenomena which are observed."

Apropos of the discussion in the present number of THE OPEN COURT, we may quote the following from Dr. McCosh, relative to the intuition of body by the senses: "We know the Object as existing or having being. * * * We look on each of the objects thus presented to us, in our organism or beyond it, as having an existence, a being, a reality. Every one understands these phrases; they cannot be made simpler or more intelligible by an explanation. We understand them because they express a mental fact which every one has experienced. We may talk of what we contemplate in sense-perception being nothing but an impression, an appearance, an idea, but we can never be made to give our spontaneous assent to any such statements. However ingenious the arguments which may be adduced in favor of the objects of our sense-perceptions being mere illusions, we find, after listening to them, and allowing to them all the weight that is possible, that we still look upon bodies as realities the next time they present them-

selves. The reason is, we know them to be realities, by a native cognition which can never be overcome." μκρκ.

A FRIENDLY CORRESPONDENCE WITH MR. GLADSTONE ABOUT CREEDS. By *Samuel Laing*. London: Watts & Co., 17 Johnson's Court Fleet Street.

This little pamphlet of only nineteen pages is well worth reading. It is a concise expression of the issue between theological orthodoxy and agnostic unbelief. Mr. Gladstone had requested Mr. S. Laing to furnish him with a short summary of the negative creed and Mr. Laing complied with the wish of England's premier. Mr. Gladstone shows again in his attitude that noble sincerity which distinguishes him in everything he does and says and writes. But it is to be regretted that as a theologian he is not sufficiently familiar with the present state of things. He proves this in his article on the Field-Ingersoll controversy, where he defends propositions which have been given up even by orthodox scholars. Mr. Laing's position can be briefly characterized as agnosticism, which says that we cannot know what is behind the veil of phenomena. The result of this negative creed is: " * * * There may be *anything* in the Unknowable, 'behind the veil,' for aught we know to the contrary. * * * Thus, if anyone tells me in general terms that there is a Heaven or Hell behind the veil, I reply, 'It may be so; I do not know.' But, if he attempts to define them, and tells me that by going vertically upwards I shall meet the one, and by going vertically downwards the other, I reply, 'This is merely an erroneous guess; it is simply impossible.'" Our criticism of this position appeared in the editorial of No. 82 of THE OPEN COURT, "Phenomena and Noumena." We need not repeat it here.

NOTES.

The annual series of Mr. Chadwick's Sermons may be had for fifty cents. (George H. Ellis, 141 Franklin Street, Boston.)

Prof. George B. Fisher, of Yale, contributes to the April *Forum*, a reply to Cardinal Manning's attack upon our public school system.

We have received a little pamphlet by Dr. G. M. Gould, "Concerning Reflex Neuroses due to Eye-Strain." (*Medical and Surgical Reporter*.)

In *Scribner's* for April, Charles Francis Adams, President of the Union Pacific, discusses in a very practical way the question of how to prevent railroad strikes.

We have received from Mr. Peter McGill a rejoinder to Wheelbarrow's remarks upon the strictures of his critics, which came too late for publication in the present number.

The problem discussed by M. Binet, in his essay "Sensation and the Outer World," will be treated editorially in the next issue of THE OPEN COURT, under the title "Idealism and Realism."

The "Freethinkers' Magazine" for April contains a full-page steel-plate portrait of Dr. R. R. Westbrook, President of the American Secular Union, and a likeness of J. J. McCabe, with full biographical sketches of each.

Prof. Max Müller's Address before the Society for the Extension of University Teaching, entitled "Some Lessons of Antiquity," has been published. Prof. Müller maintains, apropos of the present tendency to denounce our university curricula as antiquated and useless, that it is the duty of all university teaching never to lose touch with the past. "It seems to me the highest aim of all knowledge to try to understand what is, by learning how it has come to be what it is. That is the true meaning of history, and that seems to me the kind of knowledge which schools and universities are called upon to cultivate and to teach."

Secular Thought

A Journal of Liberal Thought.

The Official Organ of the Canadian Secular Union.

\$2 a Year. Published Weekly. Single Copy, 5c. CHARLES WATTS, EDITOR.

31 Adelaide Street East, Toronto, Ont., Canada. Read what Colonel Ingersoll says:

“I am greatly pleased with ‘Secular Thought’—with its form, arrangement, and contents—above all, with its spirit. It is splendid. I don’t see how it could be better. I read it with the greatest of pleasure.”

Col. ROBT. G. INGERSOLL.

Read what Helen H. Gardener says:

“Permit me to congratulate you on the fine appearance and tone of ‘Secular Thought.’ I heartily congratulate our Canadian friends upon the fact that they are represented by a paper of which they can be justly proud, and which they need never hesitate to hand to their most delicate-minded friends, however religious they may be.”

HELEN H. GARDENER.

PUBLICATIONS OF “THE OPEN COURT.”

DREAMS, SLEEP, and CONSCIOUSNESS.

By GEORGE M. GOULD, M. D.

PRICE 15 CENTS.

The researches of Dr. Gould upon the nature of consciousness, as studied from the facts of sleep and dreams, are highly interesting, not only as affording suggestions of scientific value, but as exhibiting marks of an exact and cultivated introspective talent.

The Idea of God.

By Dr. PAUL CARUS.

PRICE 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing:

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Entheism, the Monistic Conception of God.

Principles of Art.

From the Standpoint of Monism and Meliorism.

By Dr. PAUL CARUS.

PRICE 10 CENTS.

Being a critical dissertation upon the principles of art in every phase of human expression.

MONISM AND MELIORISM.

By Dr. PAUL CARUS.

PRICE 50 CENTS.

Monism is defined as that unitary conception of the world which attempts to explain all problems from one principle, and Meliorism as that contemplation of life which rejecting optimism as well as pessimism, finds the purpose of life in the aspiration after constant progress to some higher state of existence, in a word, in perpetual labor towards amelioration. Monism represents the scientific, and Meliorism the ethical aspect of this philosophical system.

The author starts from Kant, points out the dualism in Kant's views and ventures to reconcile it in his monism. His own views are based on an inquiry into Hume's problem concerning the law of causation.

The appendix of Definitions and Explanations will be of special value to students of philosophical topics.

THE

Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects

1. The Psychology of the Cell—Introductory.
2. The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.
3. The Psychology of Nutrition: Heterophytic, Saprophytic, and Animal Nutrition; Predatory Habits of Certain Animalcula.
4. Colonies of Unicellular Organisms.
5. Fecundation of Proto-Organisms.
6. Fecundation of Higher Animals and Plants.
7. The Physiological Function of the Nucleus.
8. Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instanced, apart from the author's original investigations, the researches of Balbiani, Cleparde and Lachmann, Maujas, Ribot, Heckel, Engelmann, Espinas, Fuchet, Weber, Pfeffer, Keut, Dujardin, Gruber, Nussbaum, Bütschli, Lieberkühn.

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Dr. G. J. Romanes, that the first appearance of the various physical and intellectual faculties is assignable to different stages in the scale of zoological development.

16 mo, 135 pages. Cloth, 75 Cts. Paper, 50 Cts.

CHICAGO, ILL.

Review of Recent Work of THE OPEN COURT.
PSYCHOLOGY AND BIOLOGY.

- EXPERIMENTAL PSYCHOLOGY IN FRANCE. ALFRED BINET.....No. 74.
DREAM, SLEEP, AND CONSCIOUSNESS. DR. GEORGE M. GOULD.....Nos. 74 and 75.
BODY AND MIND; OR THE DATA OF MORAL PHYSIOLOGY. FELIX L. OSWALD, M. D.....Nos. 72, 75, 78.

M. BINET's entertaining sketch of the state of Experimental Psychology in France is the only direct and convenient source from which the reader can obtain a comprehensive idea of the contributions the author's country is making to this branch of mental science. The work of psychologists in France is distinguished by its almost exclusive bearing upon the pathological phases of psychological phenomena. The greatest successes of MM. Ribot, Richet, Charcot, and others, have been in treating the *diseases* of the mind.

PHILOSOPHY.

- SENSATION AND MEMORY. EDITOR.....No. 74.
COGNITION, KNOWLEDGE, AND TRUTH. EDITOR.....No. 76.
MONISM AS THE FORMAL PRINCIPLE OF COGNITION..No. 78.

In the two first discussions, the conditions and processes by which we start from the bare excitations of the sensory world and attain to knowledge, are unfolded. Sensation is the primal condition of all knowledge; the products of sensation are preserved and transmitted as psychological forms; the psychological law of this retentive power is memory, from which source are evolved the different branches and varied forms of human thought.

The last essay of this series shows that the constitution of the human mind naturally predisposes man for Monism. The unitary conception which the intellect seeks to formulate respecting all things brought within its range, is the inward proof offered to us of the correctness of the monistic philosophy. Monism is thus a subjective principle, informing us how to unify knowledge and make it potent.

- AXIOMS THE BASIS OF MATHEMATICS. DR. EDWARD BROOKS.....No. 76.
THE OLD AND THE NEW MATHEMATICS. EDITOR.No. 77.
A FLAW IN THE FOUNDATION OF GEOMETRY.
HERMANN GRASSMANN.....No. 77.

In No. 76, Dr. Edward Brooks of Philadelphia, takes exception to an editorial thesis that "mathematics is unfortunately constructed on axioms." To Dr. Brooks no other way of construction is possible. There exist "*first truths or axioms* which the mind has power to cognize," which are incapable of proof, and which every system, even though nominally rejecting them, nevertheless tacitly employs. The editorial answer to Dr. Brooks, in No. 77,

is based upon the principles unfolded in the series of disquisitions on "Form and Formal Thought," in Nos. 64, 66, 67, and 69. Axioms so called, are the *result* of reasoning, and not the basis of it; the laws of *formal thought* determine the correctness and necessity of a proposition; conformity, in every instance, with these laws alone makes a truth universal. The relations of actual, material space have thus universally coincided with the laws of a formal system of third degree, and hence the rigidity and finality of those relations. In the same number, a translation from Hermann Grassmann's "Theory of Extension" is presented; it contains the fundamental points of departure of the new geometry from the old. No English version of this epoch-making work exists. The discussion will greatly interest those who have given their attention to the philosophy of mathematics.

SOCIOLOGY AND ECONOMICS.

- HENRY GEORGE AND LAND TAXATION. WHEELBARROW.....No. 73.
SYMPTOMS OF SOCIAL DEGENERACY. MONCURE D. CONWAY.....No. 74.
MAKING BREAD DEAR. WHEELBARROW.....No. 78.

WHEELBARROW opposes Mr. Henry George and the doctrine of Land Taxation with proper regard for the truth contained in the distinguished economist's theories. Objection is mainly taken to the universal curative power that the advocates of Land Taxation claim for their remedy. In man's obedience to moral laws Wheelbarrow finds the only magic wherewith to change the face of society.

Much criticism has been elicited by the bare mention of Mr. George's economical doctrines—indubitable testimony of their popularity and strength. Letters have appeared in No. 79 and others will follow.

"Symptoms of Social Degeneracy," Mr. Moncure D. Conway finds to be not unfrequent even in American civilization. We are prone to emphasize the survivals of barbaric institutions in effete Europe, while overlooking the excrescences of our own body politic. Lynch-Law, literary piracy, corruption in administrative circles, are signs of the decay of an ethical system and the theology that protects it. Worst of all, these evils are not unaccompanied by attempts at palliation.

HISTORICAL AND CRITICAL.

- THE STUDY OF SANSKRIT. H. OLDENBERG....No. 79.
ASPECTS, CHRISTIAN AND HUMAN. WILLIAM R. THAYER.....No. 79.

The study of Sanskrit, upon which a series of articles commences with No. 79, is a department of historical research comparatively new. Prof. Oldenberg, one of the most eminent Sanskrit scholars of the present day, tells us in popular language the story of the origin, growth, and present state of Sanskrit research. This department of philological and historical inquiry has done more than any other towards the true interpretation of the early history, civilization, and religion of the Aryan peoples. Within less than a century results have been attained, of which former generations would not have presumed to think. The articles have been translated from the German.

Under the title of "Aspects, Christian and Human," Mr. W. R. Thayer maintains in lucid and earnest language that the influences and forces to which the great changes wrought in modern society must be attributed, have not proceeded from sources essentially Christian. These advances are distinctly secular and human in character. "Not the preacher, but the poet: not the politician, but the untrammelled agitator, men whose tongues were free, and whose hearts were fearless, have been the heralds and champions of better things."

THE DISCOVERY OF THE VEDA.*

BY H. OLDENBERG.

THE acquisition of the Veda, to which we have referred in our last paper, can hardly be accounted a discovery. The existence and position in Hindu literature of this great work, had long been known. At every step the writings that had previously been brought to light, pointed to the Veda as the source from which all proceeded—even more strikingly than in the literature of Greece, we are led back, at every turn, to the poems of Homer. Manuscripts of the Vedic texts, moreover, were to be found, not only in India; they had long been possessed in great numbers by the libraries of Europe. But an attempt had scarcely, if at all, been made to lay hold of these and see if in the unmeasurable chaos of this mass of writings a firm ground for science could not be acquired.

The Sanskrit of the great epic poems, or of Kalidasa, was understood well enough; but of the dialect in which the most important parts of the Veda were written, no more was known than one familiar with the French of to day would know of the language of the Troubadours. Without going deeply into the study it was easy to discern its inherent difficulties from the unwonted singularity of the text and its strange contents, which, in part at least, were extremely complicated, and often involved in a maze of minor details. Would an earnest explorer of this territory, even in case he succeeded, be rewarded for his pains?

It was a band of young German scholars who bent their energies to this work. Most of them are still working in our midst—Max Müller, Roth, and Weber. Two others, whose names should not be omitted here, died a few years ago; these were Adalbert Kuhn and Benfey. There was no need of undertaking great expeditions, such as were those that set out for the investigation of Egyptian and Babylonian antiquity. Those monuments in whose colossal and strange forms, fragments of a primeval age meet the eye, were wanting in India. The knowledge which was to be acquired was not contained in inscriptions, but in manuscripts.* Our scholars repaired to London for a

greater or less length of time, and the work was begun among the store of manuscripts possessed by the East India House.

There was no lack of confidence. "It would be a disgrace," wrote Roth, "to the criticism and the ingenuity of our century which has deciphered the stone inscriptions of the Persian kings and the books of Zoroaster, if it did not succeed in reading in this enormous literature the intellectual history of the Hindu nation."

Much that Roth expected has been accomplished or is on the way towards accomplishment. Of much, that was hoped for at that time, we can now say that it was unattainable, and understand why. What has been attained, however, has given to the picture, which science formed of Hindu antiquity, an entirely different aspect. Unbounded in extent, this picture formerly seemed to lose itself in the nebulous depths of an immeasurable past. Now, determinate limits have been found, and the remotest initial point has been discovered for verifiable history. Authentic sources were disclosed, leading to the earliest age of Hindu civilization, from which, and regarding which, historical testimony in the usual sense of the word became accessible; and instead of the twilight, peopled with uncertain, shadowy giants, in which the epic poems made those times appear, the Veda opened to us a reality which we may hope to understand. Or, if in many instances, instead of the *hopèd* for forms, it has afforded the eye but an empty space, even this was a step in advance. For then it was at least shown that the knowledge which was sought was not to be had; and that which had been given as such, had disclosed itself as an imaginative picture born of the caprice of a later legend-maker.

The literature of epic poetry, apparently, could no longer lay claim to an incalculable antiquity; it sank back into a sort of Middle Ages, behind which the newly discovered, real antiquity loomed forth, studding the horizon of historical knowledge with significant forms. We shall now see how the task of understanding the Veda was accomplished, and shall describe at the same time what it was that had thus been acquired. We have here a newly disclosed literature of venerable antiquity, rich in marks of earnest effort, logically developed in sharply, nay rigidly, characterized forms; we

* Translated from the *Deutsche Rundschau*.

† The royal library at Berlin also acquired and owns a rich collection of Sanskrit manuscripts, for which a foundation was laid by the purchase, at the command of Frederick William IV., of the Chambers manuscripts.

have a newly discovered piece of history, forming the historical—or shall we say unhistorical?—foundation of a people related to us by race, who at an early day set out in paths distinctly removed from the ways of all other peoples, and created their own strange forms of existence, bearing in them the germs of the misfortunes they have suffered.

By what means did we succeed in understanding the Veda?

Almost all the more important parts of the Vedic literature—for the Veda, like the Bible, is not a separate text, but a literature with wide ramifications—are preserved in numerous, and, for the most part, relatively modern manuscripts. Only rarely are they older than a few centuries; since in the destructive climate of India it could not be otherwise. The texts, however, which we find in these later manuscripts, descend from the remotest antiquity.

These texts, before they came to us, had to be transmitted through extended periods of time, written out in the present manuscript form, or indeed, in any manuscript form whatever, and have encountered misfortunes of a varied order. It is the task of the philological inquirer to ascertain the character of these events—to determine the genetic history of the texts. It may be said that these manuscripts in the shape they have been transmitted to us, resemble paintings by old masters, which bear unmistakable traces of alternate injuries and attempted restorations by professional and unprofessional hands. What we want to know, so far as it lies in our power, is their form as it originally existed.

The period to which the origin of the old Vedic poems belongs, we cannot assign in years, nor yet in centuries. But we know that these poems existed, when there was not a city in India, but only hamlets and castles; when the names of the powerful tribes which at a later time assumed the first rank among the nations of India were not even mentioned, no more so than in the Germany which Tacitus described were mentioned the names of Franks and Bavarians. It was the period of migrations, of endless, turbulent feuds among small unsettled tribes with their nobles and priests; people fought for pastures, and cows, and arable land. It was the period of conflict between the fair-skinned immigrants, who called themselves Arya, and the natives, the "dark people," the "unbelievers that propitate not the Gods."

As yet the thought and belief of the Hindus did not seek the divine in those formless depths in which later ages conceived the idea of the eternal and hidden Brahma. Wherever in nature the brightest pictures met the eye and the mightiest tones struck the ear, there were their Gods—the luminous arch of heaven, the red hues of dawn, the thundering storm-god and

his followers, the winds. The Vedic Aryans had not yet reached their later abode on the two powerful sister streams, the Ganges and the Yumna; the Sindhu (Indus) was still for them the "Mother Stream," of which one of the oldest poets of the Rig Veda says: *

"From earth along the reach of Heaven riseth the sound;
Ceaseless the roar of her waters, the bright one.
As floods of thundering rain, poured from the darkened cloud-bosom,
So rushes the Sindu, like the steer, the bellowing one."

The poetry of the Rig Veda dates from the time of those wanderings and struggles that took place on the Indus and its tributary streams. Certain families exercised the functions of priestly offices, and possessed the acquisitions of an artificially connected speech together with a simple form of chant using but few tones. These families created Vedic poetry, and transmitted the art to their posterity. The songs of the Rig Veda, which are almost all sacrificial songs, were not really what we call popular poetry. We do not hear in them the language that pours forth from the soul of a nation, as it communes in poetical rhythm with itself. It was a poetry that wanted mainly the proper hearers—the masses of the people who spoke through the mouth of the poet. Their hearers were God Agni, God Indra, or Goddess Dawn; and the poet was not he whom the passionate impulses of his own soul or his own love of song and legend impelled to sing, but he was mainly one who belonged to a poet-family—one of the families of men who in the course of time became united as a caste and erected ever more insuperable barriers between their sacred existence and the profane reality of daily life. For the gods such a poet only "could frame a worthy poem, as an experienced, skillful wheelwright makes a wagon,"—a poem which would be rewarded by the rich, princely lords of the sacrifice, with steeds and kine, with golden ornaments and female slaves from the spoils of war. "Thy blessing," says a Vedic poet to a God,†

"Rests with the givers,
With the victors, the many valiant heroes,
Who make gifts to us of clothing, kine, and horses;
May they rejoice in the splendor and plenty of divine bounty.

Let all things waste that they have won
Who, without rewarding, would profit by our hymns to heaven.
The godless ones, that boast their fortune,
The transgressors—cast them from the light of day."

It has been fatal for all thought and poetry in India, that a second world, filled with strangely fantastic shapes, was established at an early day beside the real world. This was the place of sacrifice with its three sacred fires and the schools in which the virtuosos of the sacrificial art were educated—a sphere of wonderful activity and the playground of a subtle, empty mummery, whose enervating power over the

* Hundreds of Vedic melodies have been handed down to us in a form the interpretation of which can be subject to no real doubt. As it appears, they are the oldest but unfortunately the poorest memorials of musical antiquity.

† Rig Veda V. 42. 8-9.

spirit of an entire nation we can scarcely comprehend in its full extent. The poetry of the Rig Veda shows us this process of disease at an early stage; but it is there, and much of that which constitutes the essence of the Rig Veda, is rooted in it.

In the foreground stands the sacrifice, and throughout, only the sacrifice. "By sacrifice the Gods made sacrifice; these regulations were the first," it is said in a verse which is thrice repeated in the Rig Veda. The praise of the God for whom the sacrificial offerings were intended, his power, his victories, and the prayers for possessions which were hoped for in return for human offerings—the prosperity of flocks and posterity, long life, destruction of enemies, the hated and the godless—such is the subject-matter of the multitudinous repetitions that recur throughout the hymns of the Rig Veda. Still, among these verse-making sacrificers there was not an utter absence of real poets. And thus among the stereotyped implorations and songs of praise we find here and there a great and beautiful picture—the wonder of the poet's soul at the bright marvels of nature or the deep expression of an earnest inner life. A poet from the priestly family of the Bharadvajas sings of the goddess Ushas, the dawn:*

"We see thee, thou lovely one; far, far, thou shinest.
To heaven's heights thy brilliant light-beams dart.
In beauteous splendor shimmering, unveilst thou thy bosom,
Radiant with heaven's sheen, celestial queen of dawn!

"The red bulls draw their chariot,
Where in thy splendor thou o'erspread'st the heavens;
Thou drivest away night; as a hero, a bow-man,
As a swift charioteer frightenest his enemies.

"A beautiful path has been made for thee in the mountain.
Thou unconquerable one, thou risest from out the waters.
So bring thou us treasures to revive us on
Our further course, queenly daughter of heaven."†

Another poet sings of Parjanya, the rain God:‡

"Like the driver who forward whips his steeds,
So he urges onward his messengers, the clouds.
From afar the thunder-tone of the lion arises
When the God makes rain pour from the clouds.

"Parjanya's lightnings dart; the winds blow;
The floods pour from heaven; up spring grass and plants.
To all that lives and moves a quickening is imparted,
When the God scatters his seeds on the earth.

"At his command the earth bows deeply down;
At his command hoofed creatures come to life;
At his command bloom forth the bright flowers:
May Parjanya grant us strong defence!

"A flood of rain hast thou sent; now cease;
Thou didst make penetrable the desert wastes.
For us thou hast caused plants to grow for food,
And the prayer of men thou hast fulfilled."

*The Indian word Ushas is related to the Greek Eos, the Latin Aurora.

†Rig Veda VI. 64. The hymn following is V. 83.

‡This God also reappears among the kindred peoples of Europe, as Flörgynn in the northern mythology, and among the Lithuanians and Prussians as the God Perkunas, of whom an old chronicle says: "Perkunas was the third dol; and him the people besought for storms, so that during his time they had rain and fair weather and suffered not from the thunder and the lightning."

But we must turn from the description of Vedic poetry to examine the fortune that this production encountered on its way from distant antiquity to the present time, from the sacrificial places on the Indus to the workshops of the English and German philologists. Here a conspicuous fact is to be dwelt upon, which belongs to the strangest phenomena of Indian history, so rich in strange events. The hymns of the Rig Veda, as well as the hymns of the other Vedas, have been composed, collected, and transmitted to succeeding ages. There has been incorporated in them a very copious, spiritual prose literature, developed throughout the older and later divisions, and treating of the art and symbolism of sacrifice. There have also arisen heretical sects, like the Buddhists, who denied the authority of the Veda, and instead of its teachings revered as a sacred text the code of ordinances proclaimed by Buddha. *And all this has taken place without the art of writing.*

In the Vedic ages writing was not known. At the time when Buddhism arose it was indeed known—the Indians probably learned to write from Semites—but it was used only for inditing short communications in practical life, not for writing books. We have very sure and characteristic information as to the rôle which the art of writing played, or rather did not play, in the church life of the Buddhists at a comparatively late age, say about 400 B. C. The sacred text of this sect affords a picture, executed even in its minutest features, of life in the houses and parks which the brethren inhabited. We can see the Buddhist monks pursue their daily life from morning to night; we can see them in their wanderings and during their rest, in solitude and in intercourse with other monks, or laymen; we know the equipment of the places occupied by them, their furniture, and the contents of their store-rooms. But nowhere do we hear that they read their sacred texts or copied them; nowhere, that in the dwellings of the monks such things as writing utensils or manuscripts were found.

The memory of the spiritual brethren, "rich in hearing,"—what we to-day call a well-read man was then called one rich in hearing,—took the place of a cloister library; and if the knowledge of some indispensable text,—as, *e. g.*, the formula of confession which had to be recited at the full and new moon in the assembly of the brethren,—was in danger of being lost among a body of priests, they acted on the dictum laid down in an old Buddhistic ordinance: "By these monks a monk shall immediately be sent to a neighboring parish. He must be thus instructed: 'Go, Brother, and when thou hast learned by heart the formula of confession, the complete one or the abbreviated one, come back to us.'"

It must be admitted that under such circumstances

all the conditions for the existence of books, and the relations between books and reader—if it be allowed me for the sake of brevity to use these expressions—must have been of a very different nature than in an age of writing or one of printing. A book could then exist only on condition that a body of men existed among whom it was taught and learned and transmitted from generation to generation. A book could be known only at the price of learning it by heart, or of having some one at hand who had thus learned it. Texts of a content which only claimed a passing notice, could not as a rule exist. This was fatal for historical writing and generally speaking for all profane literature. Above all, the existing texts were subjected to the disfigurements that errors of memory, carelessness, or attempts at improvement on the part of the transmitters must have imported into them.

Under conditions such as have been described above, the poetry of the Rig Veda has been handed down from generation to generation through many centuries. Separate poems were brought into the collection in the course of oral compilation and transmission. The collection was re-corrected on repeated occasions and was brought to greater completeness; again only by oral compilation and transmission. It is conceivable enough that thus the original structure was, even the existence itself of special hymns was often injured, effaced, or destroyed. Remodeling destroyed their form. The lines of division between hymns standing side by side would often be forgotten and numbers of them would be merged into an apparent unity. Modern, and easily intelligible terms drove out the obsolete phrases and the ancient word-forms—often the most valuable remains for the investigator, whom they help to explain the history of the language, just as the scientist deduces from fossil remains the history of organic life.

Especially fatal was it for the old and true form of the Vedic hymns that they have been stretched upon the Procrustean bed of grammatical analysis. Earlier and more strongly than in any other nation of antiquity, was interest and pleasure taken in India in scientifically dissecting language. Closely examining the separate sounds of speech and their underlying modifications, they employed exceptional ingenuity and discrimination in constructing a system from which, when it became known in Europe, the science of our century found ample reason to learn much that was marvellous. The ingenuity and penetration of the students of Vedic literature has been burdened like a curse with that genuinely Hindu trait, subtlety; the joy—which at times seems to border on maliciousness—of stretching and forcing things into an artistic garment, of building up labyrinths of fine points, in whose involved courses the skilled and cunning stu-

dent ostentatiously thought himself able to find his way. Thus, in this grammatical science, understanding and misunderstanding of correct principles are mingled in inexplicable confusion. That under the hands of such linguistic theorists the precious wealth of the old Vedic hymns has not remained inviolate, is easily comprehended. In this fact, a single feature of the remains of these early times was hit upon with rare acuteness and established with wonderful truth; no consideration had prevented the destruction of great masses of old and genuine phenomena to suit half-correct theories. Thus the most patient penetration of our science will be able to restore the lost material only in part.

Finally, however, the caprice under which the hymns of the old singers must have suffered, had its end. The more people accustomed themselves to see in these poems not merely beautiful and efficacious prayers but a sacred revelation of the divine, the higher did their transmitted form—even when this is, or seems to be, of necessity, so irregular—rise in the respect of theologians, and the more careful must they have been to describe and preserve this form with all its dissimilarities.

We possess a remarkable work—it is composed in verse like many Hindu treatises and hand-books—in which a grammarian, Caunaka, who must probably be placed about the time 400 B. C., has given a deep and unusually well-planned survey of the vocal peculiarities of the Rig Veda text. The study of Caunaka's work affords us the proof that *from that time on* the Vedic hymns, protected by the united care of grammatical and religious respect for letters, have suffered no further appreciable corruptions. The most important manuscripts of the Rig Veda which we know, may be two thousand years later than this hand-book of Caunaka's, but they bear all tests in a remarkable way if we compare them with it.

The Rig Veda, indeed, which that Hindu scholar found, was not unlike a ruin. And it was hardly possible by the help of Hindu scholarship to transmit it to posterity in a better condition than it was received. But still the conscientious diligence of the Hindu linguists and divines accomplished something: for the last two thousand years it has preserved these venerable fragments from the dangers of further decay. They lie there, untouched, just as they were in the days of Caunaka. And the investigation of our day, which has already succeeded in bringing forth from many a field of ruins the living features of a by-gone existence, is at work among them, now with the bold grasp of confident divination, now in the quiet uniformity of slowly advancing deliberation, to deduce whatever it may of the real forms of those old priestly poems.

PASSIONS AND MANIAS.*

BY FELIX L. OSWALD, M. D.

II.

MANY objections of Pessimism against the Ethical Tendency of the Universe can be explained away in the light of the axiom that Nature never hesitates to sacrifice the welfare of individuals to the welfare of the species. At the entrance of the loam-labyrinths which cover the table lands of central Africa the warriors of the termite ant can often be seen charging a trespasser with a recklessness which frequently results in the slaughter of the bold sentinels, but which, after all, tends to discourage intrusion and thus to secure the welfare of the community. The Leming rat, in its periodic migrations, travels in swarms, preceded by skirmishers who often bridge an ice-cleft with their own bodies, and thus enable the main force of the wandering host to continue their march unhindered.

Many an apparent paradox of the moral world conceals a similar significance. The slaughter of millions, sacrificed to the ambition of a restless conqueror, is only a modified form of the universal struggle for supremacy, which on the whole, results in the survival of the fittest and thus secures the ultimate progress of the species. The passion of inquiry, which has braved the fire of the stake and disturbed the mental peace of countless children of faith, has guided the progress of mankind from error to truth, and like the ardor of patriotism, often compensates, by methods of its own, even the individual sacrifices of its martyrs, whose courage, in exile and chains, has been sustained by the genius of the species, and whose toils have been rewarded by confident previsions of immortal fame. There is, indeed, no doubt, that the interests of the Species are often promoted through the medium of individual motives, as in the instinctive delusions of the sexual passion, or in the impulse of that ambition which unconsciously sacrifices the temporary comfort of its votaries to the permanent benefit of their fellow-men.

It is less directly evident, but not less certain, that under a similar disguise, even the passion of hatred often subserves an unpersonal purpose. An assassin who under the sway of resentment risks his own life to accomplish the ruin of an enemy, might seem to use evil means for a purely evil end; yet it is certain that of all the motives apt to restrain the reckless gratifications of selfishness, the most potent is not the influence of law codes or religious precepts, but the dread of personal revenge. The court of private vendetta has again and again avenged the deeds of evildoers who could defy all other tribunals, and the assassin's dagger has thus more than once discouraged crime by

restraining the passions of unscrupulous egotists through the dread of a more reckless passion.

That passion, in its fiercest forms, can acquire a force overpowering even the instinct of self-preservation, and history abounds with the records of despots and oppressors slain in the midst of their vassals, and under circumstances making the avenger's deed an almost certain equivalent of suicide.

Nor is the sway of that self-sacrificing fury always confined to a momentary impulse. The assassin of Pedro Arbues, was proved to have prepared for the consequences of his deed a year in advance, and seems to have undertaken a journey of several hundred miles in the full assurance that the murder of the fanatical Grand Inquisitor would cost him his own life. Ravailac confessed to have haunted the favorite promenades of Henri IV. for three weeks, and Sir Emerson Tennent mentions the case of a Malay servant who had hired himself to a relative of a mortal enemy and watched his chance for two years before he finally found the desired opportunity for gratifying his revenge. Animals, under the spur of rage have been known to follow their offenders for days together. A she-leopard, in the foothills of the Abyssinian Alps, was chased up a tree by a pack of hounds, while the companions of the traveler Ruppel destroyed her young, but effected her escape after being wounded by a shot that tore off one of her ears. Three days after, the tent of the traveler was attacked by a raging beast, which succumbed only to a repeated volley of rifle-balls, and by a half-healed scar was recognized as the victim of that adventure in the foothills, where she must have taken up the trail of her assailants and followed it for a distance of sixty English miles. The naturalist Buckland relates an anecdote of a dog that had to be sold on account of its persistent hostility to a man who had incurred its resentment by an act of cruelty. Six years after that dog met its enemy in the streets of a suburb of Bristol, and at once attacked him with a fury which its new owner could explain only on the theory of hydrophobia, as the terribly mangled stranger seemed to have been the victim of a wholly unprovoked attack. For reasons of his own the wounded man endorsed that hypothesis and insisted on the dog's being slain on the spot, but laughed at the apprehensions of his private friends, and, indeed, was eventually justified in the prediction that his wounds would heal without any perilous after-effects.

Hatred is as persistent a passion as love, and the devotion of dying lovers consecrating their last hours to the task of securing the happiness of a beloved survivor, is offset by the posthumous revenge of implacable haters. De Witt, in the agony of his dying hour, roused himself on the arrival of his sons, to exact an oath of life-long hostility, to the house of Orange. Pozzo

di Borgo, the Corsican patriot, inspired all his young relatives with the passion of his hatred to the person of the first Napoleon; and the blood-feuds of Scotch and Italian families have often been perpetuated for a series of generations.

There are race-feuds which at bottom represent the antagonism of irreconcilable tendencies, and the unconscious influence of that antagonism might often explain the enigma of "hatred at first sight," an instinctive and unconquerable antipathy between two persons who perhaps have never exchanged a word and mutually avoided any act of direct discourtesy.

"Do you believe that the 'Daimon-warnings' of Socrates can be explained on the theory of clairvoyance?" I once asked a specialist in psychological studies. "I do not know how spiritualists would account for it," said he, after a pause of introspection, "but I am tempted to ascribe such presentiments to a more permanent instinct. You remember that the promptings of that *daimon* were dissuasive rather than persuasive, and I have had a similar experience at the first sight of total strangers, who somehow or other impressed me with an intuitive certainty of hostile intentions, or of danger to be avoided only by cutting their acquaintance as short as possible. And more than once I have in vain tried to explain such presentiments by any peculiarity in the appearance or the manners of the ominous individuals. Their physiological characteristics might be prepossessing rather than otherwise and their manners unexceptionable, nay their impression on others might be decidedly favorable; and yet I seemed to *know*, rather than to suspect, that to me individually any intimate relation with such persons would imply trouble. My first conjecture in such cases was generally the idea that their personal appearance must have clearly recalled that of some half-forgotten rascal who had revealed his character at my expense; but after reviewing the portraits of that rogue's gallery, I came to the conclusion that the origin of the ominous impression must antedate my personal experience. Years ago—perhaps generations ago—the path of one of my ancestors may have been crossed by an ancestor of that obnoxious stranger, or for all I know his smooth manners may conceal tendencies at daggers-drawn with hereditary tendencies of my own, and which some time or other may have exploded in a mortal feud, and would explode again in the first favorable opportunity."

Race-antipathies certainly survive the practical motives of their origin, and often assert themselves in a manner which can be explained only by the influence of hereditary intuition. After centuries of political and religious association the Semitic elements still antagonize the Latin elements in the population of Southern Spain, and even the cosmopolitan tendencies

of our own "universal nation" have failed to harmonize the discords of Celtic and Germanic characteristics. "We have a German-Irish family in our neighborhood," wrote a Texas friend of mine at the time of the Franco-Prussian war, "and it was most amusing to see how unconscious instinct prompted the five children of that neighbor to take part for or against King William. The news from Sedan fairly electrified a youngster with the flaxen hair of his Teuton father, though that father was not a Prussian at all, but a Hessian, with a private pique against the annexators of his native land. One of his brothers, with the black eyes of his Limerick mother, persisted in cheering for the defenders of Strassburg and after the surrender of that stronghold of Celtic prestige, avenged himself by kicking his brother's bulldog."

Yet Celts and Teutons have for ages been next-door neighbors; but the inveteracy of such neighborhood-feuds can often be explained by the circumstance that more dissimilar nations often dwell too far apart to develop the antagonism of rivalry. The Portuguese with all their bigotry, grant foreign heretics numerous privileges which they obstinately refuse to their next neighbors, the hated Spaniards. Persians eagerly fraternize with western Giaours to gain allies against their fellow-Moslem, the obnoxious Turks. Exile, however, is apt to correct such prejudices, and in the heart of the black Continent, Caucasians of all subdivisions become impressed with the advantage of a temporary truce—though the Cuban Caziqúe Hatwai, stoutly protested his resolution to go to Hades rather than run the risk of meeting Spaniards in Heaven. As a rule, exiled individuals will prefer the society of their nearest ethnological relatives. Darwin's experiments induced a menagerie keeper to cage à she-baboon with a couple of Brazilian ringtail-monkeys, whom she consented to adopt, but at once discarded when the keeper introduced an African ape, and it seems a significant circumstance that the Chinese immigrants seem to feel quite at home in Peru, among a race whose ancestors dated their origin from a land on the other side of the Pacific.

Instinct also guides the apparent caprices in the association of certain antipathies. It has been observed, as a moral curiosity that hatred is transferred from parent to children, far more frequently than from children to parents, though the *rationale* of that idiosyncrasy is probably the intuitive perception of the fact that parental love has deeper and more sensitive roots than filial affection, and that the attempt to wound an enemy by a blow at his child is not apt to miss its purpose. In the death of an old man's children an implacable enemy can moreover hope to accomplish the conclusive ruin of a hated lineage, and Oriental despots have often contented themselves with

effecting such purposes by a slaughter of innocents, sparing the patriarchs and female infants of a rival dynasty.

The transfer of vengeance from women to husbands (often than *vice versa*) may, on the other hand, be founded on an instinct developed in an age of universal polygamy, supplemented by female slavery and *suttee* rites. From modern data the evolution of that disposition could perhaps be explained only from the fact that a bereaved husband, even after the middle of life, has a chance for repairing his loss by means often denied to an aged widow. The feud of rival queens sealed the doom of the Nibelungen; but even the massacre bulletins of the Pentateuch rarely record the slaughter of female captives.

IDEALISM AND REALISM.*

IDEALISM starts from thought and sensation, from the subjective aspect of phenomena, and in its most consistent form, as spiritualism, denies the existence of matter. Realism starts from real existence, from the objective aspect of phenomena, and in its most consistent form, as materialism, denies the existence of spirit.

Now, as a matter of fact, neither spirit nor matter exist of themselves: they are abstracts. Realism is right in so far as the facts of reality cannot be considered as sham. Idealism, on the other hand, is also right, in as far as the building-stones of all knowledge are our sensations; they are the facts of reality. However, the processes that within our body produce the subjective feeling of sensations, can not be considered as essentially different from the phenomena of the outer world; since science, the classified system of observations, shows that the former not only are most intimately interwoven with and conditioned by the latter, but that they must have grown from them in the process of natural evolution.

Idealism pretends that sensations are radically different from the phenomena perceived. The sensation of light is different from ether-waves, the sensation of sound different from the vibrations of the air. In his excellent essay, "Sensation and the Outer World," in No. 83 of THE OPEN COURT, M. Alfred Binet says:

"Suppose that, my eyes being closed, I lay my hand upon my table, and that I feel a pin rolling about beneath my finger; I experience a sensation of a tactile kind, which excites in me a series of inferences, conscious, sub-conscious, and unconscious, and the whole occurrence is comprised in the following judgment: I touch a pin. In this way, through external perception, we possess knowledge of objects by the sensations they produce in us. * * *

"That which has produced our sensation of a pin, is not directly the pin; it is the nervous modification which that object has produced, in acting upon our sense of touch; our sensation follows this nervous modification. * * *

* Relative to the essay of M. Binet, "Sensation and the Outer World."

"Nothing resembles less the external object than the excitation it propagates in our nervous substance. What resemblance is there, for example, between the head of a pin that lies beneath my finger, and the physico-chemical phenomenon that passes through the sensitive fibers of my hand and that reaches my brain through the spinal marrow, where it gives rise to the conscious perception of a pin. Plainly, here are phenomena entirely dissimilar. It follows, therefore, that if there is a fact, at the present day, firmly established, it is that the sensations we experience upon contact with external objects are in no particular the copy of those objects. There is nothing outside of my eye that is like color or light, nothing outside of my organ of hearing that is like noise or sound, nothing outside of my sense of touch that is like hardness or softness or resistance, nothing outside of my sense of smell that is like a perfume, nothing apart from my sense of taste that is like a flavor." * * *

Sensation and the phenomena of the outer world are different. Sensations are not the real copies or images proper of things. The nervous system is not actually a mirror to reflect phenomena just as they are. Yet we may justly compare it to a mirror. For, after all, certain features of the phenomena are preserved. They are consequently not so entirely different as is maintained. A certain form of a phenomenon corresponds to a certain form of sensation. The phenomena being different among themselves produce sensations that in their turn also are different among themselves. And the difference suffices to distinguish them.

The electric current in the wire of a telephone is entirely different from the air-waves of sound. Nevertheless the form of air-waves produced by spoken words can be translated, as it were, into the electric current and from the electric current back again into air-waves. Both can adapt themselves to the same form and thus become messengers of information. Must we declare that all communication through the telephone is impossible because electricity and sound-waves, wire and air, are entirely different?

It is true that the pin on the table does not resemble the physico-chemical phenomenon that takes place in our nerves. But it is true nevertheless that this physico-chemical phenomenon of our sensation together with the memories of other sensations, especially those of touch and sight, produces in our mind the conception of a pin. In spite of all difference between the outer world and sensation, the pin as we conceive it to be, is the net result of such sensations. This is possible as in the example of the telephone by a transference of motion from one medium to another through the *preservation of form*. The same is true of the whole world. Our conception of the world, in order to be true, must ultimately be based on the facts of sensation—not on the subjective aspect of sensation only, but also and especially on its objective aspect as motions of a special form. In this way only can we acquire a conception of the objects, as they must be supposed to be independent of the subject.

The difference between the phenomena of the outer world and sensations, appears more striking than it really is, because, in order to understand a process fully, we must reduce it to some form which can be expressed in mathematical symbols or figures. Formal thought is always the basis of a scientific comprehension, and in order to comprehend a phenomenon, so as to measure and calculate it, we must in many cases translate it, as it were, into the language of that sense which is the organ of measurement and calculation. Therefore audible sound-phenomena are represented as visible air-waves. Hence the growing importance of the sense of sight.

Every manifestation of nature that affects us either directly or indirectly can thus afford us material for our sensation. Inasmuch as all existence must manifest its existence somehow (if it did not, it could not be said to exist), we maintain that all existence can at least indirectly be or become an object of cognition. Cognition never alters the data of sensory experience, although the invention of instruments may enlarge its reach. The Copernican system differs from the naïve view, that the earth is a flat disk, not because it denies or contradicts the facts of sensation, but because it arranges them more systematically with the assistance of mathematics (*i. e.* the method of formal thought).

It is a misconception of knowledge to demand that it should be something different than a methodical arrangement of facts. Our cognition, although it may translate one sensation into another, never indeed goes, nor need it go, beyond sensation. P. C.

A DEFENDER OF AGNOSTICISM.

COL. INGERSOLL declares in his article "Professor Huxley and Agnosticism,"* that the Agnostic "has ceased to inquire into the origin of things. He has perceived the limitations of the mind." Thus our fervent iconoclast shuts the door to investigation, and "restricts himself to the examination of phenomena, to their relations, to their effects," because, as he says, "he has no means of a scientific knowledge of the unseen world or of the future."

If by the unseen world we understand the aspirations of man's moral and intellectual nature, the spiritual treasures which neither moth nor rust corrupt and which thieves do not steal, we can indeed have positive knowledge of it, and we are little helped by a simple denial of its knowability.

We side with Col. Ingersoll whenever he opposes the superstitious notions of old theologies; but we urge like many of his opponents, that he should not take "something of value from the life of man," unless he can give something more valuable in its stead. We do not live for the present only, and not merely to make ourselves happy here.

* *N. A. Review*, April, 1896.

"Life is real, life is earnest,
And the grave is not its goal."

Col. Ingersoll says that the Agnostic "endeavors to find in the complexity of things the true conditions of human happiness." It is not clear how complexity can be the condition of happiness. But we recognize that the duties of life must be placed above happiness and even above life itself. We must not confine ourselves to the horizon of our present existence. We live, and think, and work in the present, but let us live so that we continue to live in future generations.

Col. Ingersoll opposes supernaturalism and metaphysics, and he is right in that. But not perceiving how inconsistent he is, he establishes at the same time another supernaturalism and metaphysics in the Unknowable that limits our mind. P. C.

CORRESPONDENCE.

THE SPIRIT OF MR. GEORGE'S WORK.

To the Editor of THE OPEN COURT:—

WHEELBARROW has failed to catch the real spirit of Mr. George's work.

His friend Tom Clark was not confronted with Mr. George's law when he selected a quarter section of land in Boone County. Under Mr. George's plan the government would not say to Tom Clark, "This land is the common property of all the people, and before you can have it you must pay the land-value of that quarter section. This is fixed at \$1.25 an acre." But it would say to him: "There are thousands of acres of land around here that no one is using, you just go ahead and take as much of it as you can use and it will cost you nothing, until such time as the country settles up. Then you will have to pay in the shape of taxes, annually, whatever the privilege of the exclusive use of this land may be worth." Tom Clark would then have the \$200 which he paid for the mere privilege of access to this wild land left in his pocket, and this would greatly aid him in improving his land. Indeed, with money he could have broken the "forty acres at a cost of \$3 an acre," and have \$80 left to enable him to purchase a pair of oxen, or something of the like. Bear in mind that Tom Clark, bowing to the Divine Mandate, "In the sweat of thy brow shalt thou eat bread," simply wanted this land that he might, by applying his labor to it, extract a living for himself and family.

Tom Clark works hard early and late. By the hardest kind of toil and the practice of patience and the exercise of self-denial he has made "his plantation in the rough worth about \$500." Wheelbarrow is right in saying that the community did not put this value on the land. Tom Clark, by the sweat of his brow, put it there, and it should be his as against the world. Yet under our present system the tax collector would come around and tax him on the full value of his improvements. He has done a good thing. By improving his farm, building a house, and raising food, he has added to the world's wealth.

Now, there is no doubt that all this time there were thousands of acres of land all around Tom Clark's farm, held by people who had no idea of using it. They bought it for speculative purposes. They do not propose to do anything with it by which labor can be employed. They do not propose to invest a dollar, or do a day's work in the improvement and cultivation of this land. Yet they intend to get rich out of it nevertheless, by holding it until such time as the pressure of population makes the competition for it

sharp, and men will be willing to pay a high price for it, rather than be driven out beyond the confines of civilization. Now the essence of the evil lies in this: Under the present system, Tom Clark must pay the government say 1 per cent. taxes on his land and improvements amounting to \$5 per year, and if he does not pay it, his farm, improvements, and all, will be sold for taxes. (Let Wheelbarrow say whether this is "arbitrary" and "despotic" or not, as he charges Mr. George's plan with being.)

The speculator, however, is only taxed on the prairie value of his farm, or say \$2 per year. Yet he has the same power over the land he holds that Tom Clark has over his. He has the power of excluding others from it. Then why should he not pay as much for the privilege of holding it idle as Tom Clark does for improving his. Other hard working farmers like Tom Clark settle in the neighborhood, and by their common energy and toil will add yearly to the value of the speculator's land. But will they get any benefits from this increase in the value of his land, which they themselves have caused. Will the speculator give them any of this unearned increment which they themselves have produced? Not at all. But on the contrary, should one of these farmers desire to enlarge the boundaries of his farm, or settle his son on adjoining land, he will have to pay the speculator for the very increase of the value of the land which has resulted from his own labor on his own land, and his own presence in the community. Thus the speculator gets something for nothing, and it is at this Mr. George's plan is aimed

Tax unimproved land as much as you tax improved land, and speculators will be compelled either to put it to some use, or abandon it. Working farmers like Tom Clark would be benefited.

One word more. The passages Wheelbarrow refers to in *Progress and Poverty*, and upon which he bases all his anxiety for his friend Clark, occur in discussions of the abstract question of the right of ownership as now understood; a question that must be settled in Wheelbarrow's mind before the details of the practical application can be fairly discussed. I beg to refer him to the eighth book of *Progress and Poverty* where the application of the proposed remedy is fully gone over.

MILWAUKEE, March 25, 1889.

PETER MCGILL.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXIII.—Continued.

Mr. Hummel was sitting in his warehouse before a battalion of new hats with broad brims and round crowns, which were placed for review before his field-marshal's eye, and he spoke reprovingly to his book-keeper:

"They are like mere barbers' basins; man is losing his dignity. At all events, we shall make profit by these coverings: no one notices the cats'-hairs of which they are made; but they rob the head of the German citizen of the last breath of fresh air that he has hitherto secretly carried about with him in his high hat. In my youth one recognized a citizen by three points: on his body he wore a coat of blue cloth, on his head a black hat, and in his pocket a great house-key, with the ring of which, in case of assault by night, he could twist the noses of assassins. Now he goes off in a gray jacket to drink his beer, opens the door of the house with a small corkscrew, and the last high

hat will probably be bought up as a rarity for art collections. You may immediately put aside part of our manufacture for antiquarians."

This pleasant grumbling was interrupted by Laura, who entered eagerly, seized her father's hand with an imploring look, and drew him from his warehouse into his small office. Mr. Hummel submitted to be thus led, as patiently as Lot when the angel led him from the burning cities of the valley. When she was alone with her father she threw her arms about his neck, kissed and stroked his cheek, and for a long time could bring out nothing but "My good, noble father." Mr. Hummel was well pleased with this stormy fashion of endearment for a time.

"Now I have had enough of this caressing. What do you want? This introduction is too grand for a new parasol or a concert ticket."

"Father," cried Laura, "I know all that you have done for our neighbor. I beg your forgiveness; I, unfortunate one, have misunderstood your heart, and have many times inwardly resented your harshness."

She kissed his hands, tears falling from her eyes.

"Has that dough-face over the way been blabbing?" asked Mr. Hummel.

"He was obliged to tell me, and it was a happy moment for me. Now I will acknowledge all to you with shame and repentance. Forgive me."

She sank down before him.

"Father, I have long been sick at heart. I have thought you pitiless. Your eternal grumbling and enmity to our neighbor have made me very unhappy, and my life here has often been miserable."

Mr. Hummel sat erect and serious, but a little dismayed at the confession of his child, and he had an indistinct impression that he had carried his rough opposition too far.

"That is enough," he said; "this is all excitement and imagination. If I have been vexed through all these years, it has not done me any harm, nor the people over the way either. It is an unreasonable sorrow that now excites your lamentations."

"Have consideration for me," entreated Laura. "An irresistible longing to go forth from this narrow street, has entered my soul. Father, I would like to take a leap into the world."

"Indeed!" said Mr. Hummel. "I also should like to take a leap into it, if I only knew where this jolly world could be found."

"Father, you have often told me how light was your heart when you wandered forth as a boy from your native town, and that from these wanderings you became a man."

"That is true," replied Hummel. "It was a fine morning, and I had eight pence in my pocket. I was as lively as a dog with wings."

* Translation copyrighted.

"Father, I also should like to rove about."

"You?" asked Hummel. "I have laid aside my knapsack; there are only a few hairs remaining on it, but you may tie your boots over it; then one cannot see it."

"Good father, I also want to go out and seek my way among strangers, and look out for what will please me. I will try my powers, and fight my way with my own hands."

"You must put on breeches," said Hummel; "you cannot otherwise go alone in your wanderings."

"I will take some one with me," answered Laura, softly.

"Our maid Susan? She can carry a lantern for you. The paths in this world are sometimes muddy."

"No, father; I mean the Doctor."

She whispered to him:

"I want the Doctor to elope with me."

"Ah, you little spider!" cried Hummel, amazed.

"The Doctor elope with you! If you were to elope with him, there would be more sense in it."

"That's just what I want to do," replied Laura.

"Mutually, then!" said Hummel. "Listen: the matter becomes serious. Leave off embracing me, keep your hands away, and make a face beseeching a citizen's daughter and not an actress."

He pushed her down on the window-seat.

"Now speak to the point. So you intend to carry off the Doctor? I ask you, with what means? For your pocket-money will not reach far, and he over the way has not much to spare for such Sunday pleasures? I ask you, will you first marry him? If so, the elopement would be very suspicious, for I have never yet heard of a woman carrying off her husband by force. If you do not marry him, there is something which you must learn from your mother, and which is called modesty. Out with it!"

"I wish to have him for a husband," said Laura, softly.

"Ah, that is it, is it? and was your Doctor ready to take charge of you before marriage, and to run away with you?"

"No; he spoke as you do, and reminded me that I ought not to give you pain."

"He is occasionally humane," replied Hummel; "I am indeed indebted to him for his good intentions. Finally, I ask you, where will you carry him off to?"

"To Bielstein, father. There is the church in which Ilse was married."

"I understand," said Hummel, "ours are too large; and what afterwards? Do you mean to work as a day-laborer on the estate?"

"Father, if we could but travel," said Laura, imploringly.

"Why not," replied Mr. Hummel, ironically; "to

America, perhaps, as colleagues of Knips junior? You are as mad as a March hare. The legitimate and only daughter of Mr. Hummel will run away from her father and mother, from a comfortable house and flourishing business, with her neighbor's only son, who is in his way also legitimate, to a fools' paradise. I never could have thought that this hour would arrive."

He paced up and down.

"Now hear your father. If you had been a boy I would have had you well thrashed; but you are a girl, and your mother has formed you according to her principles. Now I perceive with regret that we have allowed you to have your own way too much, and that you may be unhappy for your whole life. You have got the Doctor into your head, and you might as well have fixed upon a tragic hero or a prince, and it shocks me to think of it."

"But I have not thought of such," replied Laura, dejectedly; "for I am my father's daughter."

Hummel laid hold of the plaits of her hair and examined them critically:

"Obstinacy; but the mixture is not throughout the same; there is something of higher womanliness with it; fancifulness, and whimsical ideas. That is the misfortune; here a powerful stroke of the brush is necessary."

These words he repeated several times, and sat down thoughtfully on his chair.

"So you wish for my consent to this little elopement. I give it you upon one condition. The affair shall remain between us two; you shall do nothing without my consent, and even your mother must not know that you have spoken to me of it. You shall take a drive into the world, but in my way. For the rest, I thank you for this present that you have made me on my birthday. You are a pretty violet for me to have brought up! Has one ever heard of such a plant taking itself by the head and tearing itself out of the ground?"

Laura embraced him again, and wept.

"Do not set your pump again in motion," cried Mr. Hummel, untouched, "that cannot help either of us. A happy journey, Miss Hummel."

Laura, however, did not go, but remained clinging to his neck. The father kissed her on the forehead.

"Away with you; I must consider with what brush I shall stroke you smooth."

Laura left the room. Mr. Hummel sat alone for a long time by his desk, holding his head with both hands. At last he began to whistle in a low tone the old Dessauer—a sign to the book-keeper, who was entering, that soft feelings had the upper hand with him.

"Go across to the Doctor, and beg him to take the trouble of coming over to me immediately."

The Doctor entered the office. Mr. Hummel rummaged in his desk and brought out a little paper.

"Here, I return you the present that you once made me."

The Doctor opened it, and two little gloves lay within.

"You may give these gloves to my daughter on the day on which you are married to her, and you can tell her they come from her father, from whom she has run away."

He turned away, approached the window, and thrummed on the pane.

"I have already told you before, Mr. Hummel, that I will not take back these gloves. Least of all will I do it for this purpose. If the happy day is ever to come to me when I can take Laura to my home, it will only be when you put your daughter's hand in mine. I beg you, dear Mr. Hummel, to keep these gloves until that day."

"Much obliged," replied Hummel; "you are a miserable Don Juan. I am in duty bound," he continued, in his usual tone, "to communicate to you what is of fitting importance to you. My daughter Laura wishes to elope with you."

"What now disturbs Laura," answered the Doctor, "and has given her these wild thoughts, is no secret to you. She feels herself oppressed by the unpleasant relations which subsist between us. I hope this excitement will pass away."

"May I be allowed to ask the modest question, whether it is your intention to agree to her plan?"

"I will not do it," rejoined the Doctor.

"Why not?" asked Hummel, coldly. "I for my part, have no objection to it."

"That is one reason the more for me not to act inconsiderately by you, nor to be treated in a like manner."

"I can bequeath my money to the hospital."

"To this remark I have only one answer," replied the Doctor. "You yourself do not believe that this consideration influences my actions."

"Unfortunately not," replied Hummel; "you are both unpractical people. So you hope that I will at last give you my blessing without an elopement?"

"Yes, I do hope it," exclaimed the Doctor. "However you may wish to appear to me, I trust that the goodness of your heart will be greater than your aversion."

"Do not count upon my indulgence, Doctor. I do not believe that I shall ever prepare a marriage-feast for you. My child gives herself with confidence into your hands; take her."

"No, Mr. Hummel," replied the Doctor, "I shall not do it."

"Has my daughter sunk so much in value because

she is ready to become your wife?" asked Mr. Hummel, bitterly, and with a rough voice. "The poor girl has acquired some notions among her learned acquaintances, which do not suit the simple life of her father."

"That is unjust towards us all, and also towards our absent friends," said the Doctor, indignantly. "What now distracts Laura is only a petty enthusiasm; there is still in her some of the childish poetry of her early girlhood. He who loves her may have perfect confidence in her pure soul. Only in one respect must he maintain a firm judgment in dealing with her; he must here and there exercise a mild criticism. But I should be unworthy of the love of her pure heart if I should agree to a hasty proceeding, which would at a later period occasion her pain. Laura shall not do what is unbecoming to her."

"So that is Hindoo," replied Mr. Hummel; "there is a spark of sound common sense in your Botocudens and Brahmins. Do your learned books also find an excuse for a daughter not feeling happy in the house of her parents?"

"That is your fault alone, Mr. Hummel," replied the Doctor.

"Oho!" said Mr. Hummel; "so that's it."

"Forgive me my plain speaking," continued the Doctor. "It is the fashion of Laura's father to play the tyrant a little in his family, in spite of all his love for them. Laura has from her childhood been accustomed to view your strange nature with fear; therefore she does not form the impartial conception of your character, nor feel the pleasure in your mischievous humors that those not so intimately acquainted enjoy. If you had seen Laura's transport when I made known to her what you had done for my father, you would never doubt her heart. Now she is overcome with anguish about our future. But you may be assured, if Laura were to give in to her fancy and separate herself from her parents' house, she would soon feel gnawing repentance and longing for her parents. Therefore, the man for whom she would now make this sacrifice acts not only honorably, but also prudently, in resisting it."

Mr. Hummel looked fiercely at the Doctor.

"There is the old bear tied to a stake, the young puppies pull at his fur, and the cocks crow over his head. Take warning by my fate; under all circumstances avoid having female offspring." He put his hand upon the gloves, packed them up again, smoothed the paper, and shut them in his writing-desk. "Thus shall I lock up again my unnatural child; for the rest I remain your devoted servant. So your old Hindoos tell you that I am a droll screech-owl, and a jolly *bon-vivant* to strangers. Is that your opinion of my natural propensities?"

"You are not quite so innocent," replied the Doctor, with a bow. "To me you have been always particularly rûde."

"There is no one I would rather wrangle with than with you," acknowledged Mr. Hummel.

The Doctor bowed, and said:

"When you play with other men as with cats, they only bear such treatment because they perceive good intentions under your cross-grained exterior. I can say this to you, because I am one of the few men to whom you have shown real dislike; and, as you are also obstinate, I know very well that I shall still have to have many a tilt with you, and I am not at all sure how it will end between us. That, however, does not prevent my acknowledging the bitter amiability of your nature."

"I object to any further enlightenment as to my real character," exclaimed Mr. Hummel. "You have a disagreeable way of viewing your fellowmen microscopically. I protest against your painting me like a flea in the shadow on the wall. As concerns your proceedings as my daughter's lover, I am content with them. You do not choose to take my child in the way in which she is to be had; I thank you for your scruples. In this matter we are entirely of the same opinion, and you therefore shall not have her at all."

The Doctor wished to interrupt him, but Hummel waved his hand.

"All further talk is useless; you renounce my daughter, but you preserve the esteem of her father, and you have moreover the feeling of acting for the best for Laura. As you feel such great uprightness, you may console yourself with it. You will devote yourself to celibacy, and I should envy you, if it were not for the consideration of Madame Hummel."

"This will not avail, Mr. Hummel," replied the Doctor; "I have not the least intention of renouncing Laura's hand."

"I understand," replied Mr. Hummel; "you wish to besiege my daughter still, from across the street. This quiet pleasure I can, unfortunately no longer allow, for I am certainly of opinion that Laura must at some time leave my house; and as you have chosen the good opinion of the father rather than the daughter, we will confer on this point in mutual understanding. You are mistaken if you think that my daughter Laura will give up her fancies upon wise admonition. Have you not sometimes appealed to my conscience? It was all that could be expected, considering your age; but it has been of no avail with me. It will be the same with this obstinate child. Therefore I am, as a father, of opinion that we must give in to a certain degree to the folly of my child. Consider how far you can go to please us. She wishes to join the Professor's wife.

She shall not go to this capital where my lodger has no home, but she has frequently been invited to Bielstein."

The Doctor answered:

"I have urgent reasons for going to my friend during the next few days. I will gladly make a detour by Bielstein, if you will allow me to accompany Laura on this journey, I shall make no secret of its purpose,—and least of all to my parents."

"This elopement is so shabby that, were I a girl, I should be ashamed of taking part in it. But one must not expect too much of you. I will not be at home when this departure takes place: you see, that is natural. I have already made my plans concerning my child's future. I give her over to you for the journey with confidence."

"Mr. Hummel," exclaimed the Doctor, disquieted, "I ask for still greater confidence. How have you decided concerning Laura's future?"

"As you have determined to show me such respect, I beg you will be content with the confidential intimation, that I have no intention of making you any such communication. You preserve my esteem, and I my daughter. My compact is concluded."

"But the compact is not quite satisfactory to me, Mr. Hummel," answered the Doctor.

"Hold your tongue. If in consequence of this agreement your resume your theatrical career, I should advise you never to act the rôle of lover. The audiences will run out of all the doors. Do I treat people like cats?—So I treated your father and his flowers this morning. You can give him an intimation of that. My wife has plucked to-day a few roosters for my birthday; if roasting these namesakes of yours does not exite painful feelings in you, it will give me pleasure to see you at dinner. You will not be under the embarrassment of having to talk only to my daughter, for the family clown is invited: he will keep up the conversation—you may be silent. Good morning, Doctor."

The Doctor again stretched out his hand to him. Mr. Hummel shook it, grumbling all the while. When he was again alone in his office the melody of the old Dessauer again sounded in the narrow room, now brisk and hearty. Then, soon after, Mr. Hummel broke forth with the second of the two airs—"the Dear Violet"—to which he had recourse when in an unconstrained humor. At last he nixed up the drumming of the Dessauer with "the Dear Violet" in an artistic medley. The book-keeper, who knew that this *pot pourri* betokened a state of the highest spring warmth, popped his face, smiling respectfully, into the office.

"You may come to dinner to day," said Mr. Hummel, graciously.

(To be continued.)

BOOK REVIEWS.

FRENCH TRAITS: A Study in Comparative Criticism. *W. C. Brownell*. New York: Charles Scribner's Sons. Chicago: A. C. McClurg & Co.

Mr. Brownell, in this series of collected essays, has attempted a logical analysis of the prominent traits of French character. The inconsistent features of Gallic life—inconsistent at least to the Anglo-Saxon—are brought into harmony by a reference to fundamental principles which have determined the civilization of the French people. The instinct that dominates France is distinctly social, proponds Mr. Brownell, as a thesis; the French have little individual life; manners are more than character, etc. This principle is traced by the author in every phase of the life of the nation. He quotes the words of Gambetta who says, 'There are no questions but social questions.' Their morality, their art, their government, and their women are explainable by that apothegm.

Mr. Brownell's "Study in Comparative Criticism" undoubtedly is entertaining and instructive: the chapters on "Intelligence," "Women," "The Art Instinct" may be cited. We feel at times, however, the presence of an effort to find more in the subject than its nature admits; the method is often one of hyper-analysis; the ideas become blunted by the frequency of their application. The essays were not originally intended for simultaneous publication, which may account for unavoidable repetition. μρκ.

THE GOVERNMENT OF THE PEOPLE OF THE UNITED STATES. By *Francis W. Thorpe*, Ph.D. Philadelphia: Eldredge & Bro.

The work of Prof. Thorpe—of the ordinary school-book size—is adapted peculiarly to class-room purposes. It contains much material, statistical and explanatory. In addition to the "State Papers" usually contained in such works, the author has incorporated "The Mayflower Compact," "The First Declaration of Rights," and "The Emancipation Proclamation." An instructive feature is the map showing the various acquisitions of land made by the United States since 1783, as are also the diagrams illustrative of the divisions of the public domain into townships and sections. We believe the work well fitted, upon the whole, for instruction in schools. There are to be found, however, and particularly in the introductory chapters, many metaphysical generalities respecting the nature of government and rights, that the uncritical minds of young scholars, who rely implicitly on the teachings of such a work, are not competent to analyze and interpret. The impressions thus received often form the foundation of erroneous political opinions which in later life it is hopeless to confute. The definitions of "Communism" and "Socialism," on page 234, might, we think, be made more conformable to the truth contained in the leading principles of these doctrines; some of the most salutary institutions of Europe and America are communistic and socialistic in core, however they may be styled. μρκ.

ESSAYS RELIGIOUS, SOCIAL, POLITICAL. *David Atwood Wasson*. Boston: Lee & Shephard. Chicago: A. C. McClurg & Co.

About one third of the volume "Essays Religious, Social, etc.," is taken up with a biographical sketch from the pen of the editor, Mr. O. B. Frothingham. David Atwood Wasson was born in 1823, in Maine, and came of a sturdy and respected Scotch-Irish family. His boyhood life is told in an autobiography, abounding in artistically arranged incidents, where the serious verges into the comical. New England religious discipline evidently was not to his taste: "It was Calvinism to which all the heaviest sorrows of my childhood were due. Calvinism that glowers upon all natural joy, that denies to human being any intrinsic worth, to human culture any permanent use, to human perfection any loveliness in heaven's eye;—Calvinism was the curse of my young life." Yet "my case was not so bad," for Mr. Wasson had a father of sterling character and a mother from whom there had always seemed to

come down to him "a breath of sweetness, a beam of light too subtle for words." In 1845 he went to Bowdoin College, left in junior year, and in 1849 joined the Theological Seminary at Bangor. Two years later he was ordained pastor of an evangelical church in Groveland, Mass., where the non-conforming and heretical character of his sermons led to a violent severance of his connections with the church. An independent congregation was established in Groveland. It was a critical epoch. Parker and Emerson were shaking the spiritual world of the New England States. "The air was full of new views." Radicalism was settling down in philosophy. The slavery conflict was raging. The position assumed demanded courage, and Mr. Wasson, sensible of the heavy responsibility devolving upon him, was "stimulated to the utmost; he became one of a brilliant company of teachers."

Mr. Wasson's life was preëminently intellectual. But the spiritual element predominated. His views were founded upon conviction—upon the kind of conviction that is inwardly imposed and not the conviction that logically results. Logic, with him came afterwards, to justify to others the results he had reached, never to indicate to himself the paths he was to follow. Spiritual assurances he regarded as the highest expression of truth. "The soul of man was in his speculation the centre of all belief." It was infinite in depth, "contained in God, heir to the utmost resource of His being. That is the starting point—pure spiritual unity, pure personality." Mr. Wasson was, in public life, a firm champion of "advanced thought." He sympathized with the Free Religious Association and contributed frequently to *The Radical* and *The Index*. His most finished essays appeared in *The Atlantic Monthly*, *The North American Review*, and *The Christian Examiner*. Part of the memoir is devoted to an analysis of Mr. Wasson's intellectual methods, his view of life, and of the world. The essays published are: "Nature the Prophecy of Man," "Unity," "Social Texture," "Conditions of Social Productiveness," "The Puritan Commonwealth," "The New Type of Oppression," "Authority," "The Genius of Woman"; of which the last two may be mentioned as characteristic and uniting qualities of a high order of excellence. μρκ.

NOTES.

The *Magazine of American History* for April contains the De Peyster portrait of Washington, never before published.

Wide Awake for April publishes a novel and graceful Easter game for young people, "The Cascaroni Dance," illustrated by Edmund H. Garrett.

St. Nicholas for April is a charming issue. The illustrations are highly creditable to the character of the text. Lieutenant W. R. Hamilton contributes an article, which will be interesting to young readers, on "Ancient and Modern Artillery." The continuation of Mr. Edmund Alton's "Routine of the Republic," forms a proper counterpart to the former.

The Century for the present month, a Centennial number, is devoted mainly to topics suggested by the inauguration of President Washington. The illustrations are rich and numerous; many are copies of unpublished prints and portraits in the possession of private families and private collections. Mr. John Bach McMaster, in "A Century of Constitutional Interpretation," traces, with a masterly hand, the origin of many political problems.

In a pamphlet of ninety-nine pages, entitled "*Pioneer Path, The Gist of Lectures on Rationalism*," (Truth Seeker Co., New York), Mr. Robert C. Adams discusses the conditions and methods of progress in human thought. "The first essential to efficient action," says the author, "is a right conception of the universe. *** All religions, therefore, depend upon a Cosmogony, a theory as to the origin and nature of the world."

EVERY LADY

Wants a Silk Dress.

This is your opportunity. A new Departure. SILKS direct from the manufacturers to you.

Our reduced prices bring the best goods within reach of all. We are the only manufacturers in the U. S. selling direct to consumers.

You take no risk. We warrant every piece of goods as represented, or money refunded. See our references. We are the oldest Silk Manufacturers in the U. S. Established in 1838, with over 50 years experience.

We guarantee the

Chaffee Dress Silks,

for richness of color, superior finish, and wearing qualities, to be unexcelled by any make of Black Silks in the World. We offer these Dress Silks in Gros Grains, Satins, Surahs, Faille Francaise, and Aida Cloths, in Blacks only. We send to all parts of the U. S. It will cost you only a postal card to see for yourselves. Send a postal and we will forward you SAMPLES FREE with prices.

O. S. CHAFFEE & SON,
MANSFIELD CENTRE, CONN.

Refer, by permission, to First National Bank, Windham National Bank, Dime Savings Bank, Williamitic Savings Institute, of Williamitic, Conn.

RECOLLECT with each Dress Pattern we present the buyer to know Yards Sewing Silk, and enough Silk Braid to bind bottom of dress.

THE PUBLISHERS OF

The Open Court

will send the

EMERSON BINDER

to any address on receipt of Price.

BACK NUMBERS WITH THE BINDER at the following prices:

Vol. I—with Emerson Binder. \$3.50
Vol. II—(current) " \$2.50

SENSIBLE LOW-COST HOUSES.—HOW TO BUILD THEM.

Our new ATLAS, entitled, "SENSIBLE LOW-COST HOUSES—HOW TO BUILD THEM," Now ready. This contains plans, illustrations, and complete descriptions of 56 New, Beautiful, and Cheap Country Houses, costing from \$800 to \$1500. Shows how you can build a \$2000 house for \$1750, and how to make them handsome, convenient, healthy, light, cool, and dry in summer, warm and cheaply heated in winter. Tells intending builders of homes what to do, and warns them what not to do. Describes houses adapted to all climates. NATIONAL ARCHITECTS' UNION, 927 Chestnut Street, Philadelphia, Pa. \$1.00 by mail.

WANTED!

An energetic and educated person wanted in every town, city, and district, to canvass for subscriptions to The Open Court; liberal compensation. Address, with references,

THE OPEN COURT PUB. CO.,
169—175 La Salle Street, Chicago, Illinois.
P. O. Drawer F.

A BIOLOGICAL MONTHLY.

The "AMERICAN MICROSCOPICAL JOURNAL" is the cheapest periodical in the United States devoted to this branch of science. No biologist should do without it. Price, \$1.00 per year; 12 cents per copy.

Box 630, WASHINGTON, D. C.

Secular Thought

A Journal of Liberal Thought.

The Official Organ of the Canadian Secular Union.

\$2 a Year. Published Weekly. Single Copy, 5c.

CHARLES WATTS, EDITOR.

31 Adelaide Street East, Toronto, Ont., Canada.
Read what Colonel Ingersoll says:

"I am greatly pleased with 'Secular Thought'—with its form, arrangement, and contents—above all, with its spirit. It is splendid. I don't see how it could be better. I read it with the greatest of pleasure." Col. ROBT. G. INGERSOLL.

Read what Helen H. Gardener says:

"Permit me to congratulate you on the fine appearance and tone of 'Secular Thought.' I heartily congratulate our Canadian friends upon the fact that they are represented by a paper of which they can be justly proud, and which they need never hesitate to hand to their most delicate-minded friends, however religious they may be." HELEN H. GARDENER.

Scientific Pamphlets.

THE OPEN COURT is in receipt of a number of the latest re-publications of the

Naturwissenschaftliche Wochenschrift,

in pamphlet form, which will be sent postpaid to any address for the price marked.

DR. V. SCHLEGEL. Ueber den sogenannten vierdimensionalen Raum. 20 Cents.

PROF. DR. A. SCHUBERT. Das Rechnen an den Fingern und Maschinen. 20 Cents.

PROF. DR. KARL KRAEPELIN. Die Bedeutung der naturhistorischen, insbesondere der Zoologischen Museen. 20 Cents.

PROF. DR. E. LOEW. Anleitung zu blütenbiologischen Beobachtungen. 20 Cents.

DR. F. M. STAPFF. Das "glaziale" Dwykakonglomerat Südafrikas. 30 Cents.

DR. ROBERT MITTMANN. Die Bakterien und die Art ihrer Untersuchung. 30 Cents.

SHELLS, MINERALS & FOSSILS

—Also—

SEEDS and PLANTS.

C. R. ORCUTT, Publisher,

The West American Scientist,
SAN DIEGO, CALIFORNIA.

PUBLICATIONS OF "THE OPEN COURT."

DREAMS, SLEEP, and CONSCIOUSNESS.

By GEORGE M. GOULD, M. D.

PRICE 15 CENTS.

The researches of Dr. Gould upon the nature of consciousness, as studied from the facts of sleep and dreams, are highly interesting, not only as affording suggestions of scientific value, but as exhibiting marks of an exact and cultivated introspective talent.

The Idea of God.

By DR. PAUL CARUS.

PRICE 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing:

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Entheism, the Monistic Conception of God.

THE MARRIAGE PROBLEM.

By E. D. COPE, Ph.D.

PRICE 15 CENTS.

A scientific discussion, from a practical standpoint, of a question now engrossing the public attention. Prof. Cope's propositions have evoked much comment and criticism.

Principles of Art.

From the Standpoint of Monism and Meliorism.

By DR. PAUL CARUS.

PRICE 10 CENTS.

Being a critical dissertation upon the principles of art in every phase of human expression.

MONISM and MELIORISM.

By DR. PAUL CARUS.

PRICE 50 CENTS.

Monism is defined as that unitary conception of the world which attempts to explain all problems from one principle, and Meliorism as that contemplation of life which rejecting optimism as well as pessimism, finds the purpose of life in the aspiration after constant progress to some higher state of existence; in a word, in perpetual labor towards amelioration. Monism represents the scientific, and Meliorism the ethical aspect of this philosophical system.

The author starts from Kant, points out the dualism in Kant's views and ventures to reconcile it in his monism. His own views are based on an inquiry into Hume's problem concerning the law of causation.

The appendix of Definitions and Explanations will be of special value to students of philosophical topics.

THE

Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects

1. The Psychology of the Cell—Introductory.
2. The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.
3. The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition: Predatory Habits of Certain Animalcula.
4. Colonies of Unicellular Organisms.
5. Fecundation of Proto-Organisms.
6. Fecundation of Higher Animals and Plants.
7. The Physiological Function of the Nucleus.
8. Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instanced, apart from the author's original investigations, the researches of *Balthazar, Clobartole and Lechmann, Meunier, Ribot, Heckel, Engelmann, Espinas, Pouchet, Weber, Pfeffer, Kent, Dujardin, Gruber, Nussbaum, Bütschli, Lieberkühn.*

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Dr. C. F. Romanes, that the first appearance of the various psychical and intellectual faculties is assignable to different stages in the scale of zoological development.

16 mo, 135 pages. Cloth, 75 Cts, Paper, 50 Cts.

PSYCHOLOGY AND PHILOSOPHY.

SENSATION AND THE OUTER WORLD...A. BINET....No. 83.

IDEALISM AND REALISM. EDITOR.....No. 84.

DREAMS, SLEEP AND CONSCIOUSNESS.

M. Binet, after having animadverted upon the impropriety of excluding metaphysical questions from the domain of science, proceeds in the above-mentioned essay to discuss the interesting question of the relation between human sensation and its normal excitant, the external world. No resemblance is predicable, maintains M. Binet, between the perceptions of consciousness and the bodies that exist beyond us. Doctrines enunciating such resemblance, the author declares fallacious, and terms them "crude and naive realisms." This fallacy, however, is widely prevalent in science. Physicists and philosophers still hold that the definitive explanation of natural phenomena is a mechanical explanation, wherein the concepts of mass and force are the ultimate and fundamental data. They fail to recognize, in this, the purely subjective character of sensations. They translate, merely, sensations of one kind into sensations of another kind, which seem to us more precise; thus, they explain the phenomenon of sound by the phenomenon of a vibration; merely substituting, thereby, a visual sensation for an auditory sensation. This leads the author to discuss the supreme importance of the visual sense in the investigation of phenomena; the possibility of a purely auricular science is held forth; the author shows that the ear, by noting the *qualities* of sound, can solve *numerical* problems. Thus, the progression of human knowledge is accompanied by a progression of human capabilities. The future will transform our sciences; it may transform our senses.

Sensation and the phenomena of the external world, it is granted, *are* different. But does it follow that knowledge of external objects is therefore impossible? The electrical phenomenon traversing the wire of a telephone bears no resemblance to the spoken words thrown against the mouth-piece in the shape of air-waves; no more so than does sensation the external object. Yet is communication by means of a telephone impossible? *Are* not the spoken words reproduced at the other end of the line in substantially the form in which they were received? *Preservation of form* is all that is necessary; and this is possible even where there is no superficial resemblance. It is a contradiction to demand that knowledge should be other than it is. Cognition does not, and need not, go beyond sensation.

In Numbers 82 and 83 two interesting letters appear, discussing questions raised by the articles of Dr. G. M. Gould upon Dreams, Sleep, and Consciousness—practical studies upon the psychology of consciousness.

ETHICS AND SCIENCE.

ETHICAL EVOLUTION. PROF. E. D. COPE.....No. 82.

The utilitarian theory of morals, says the distinguished author has found in the law of evolution a permanent substantiation. Yet does that doctrine embrace the *whole* truth, does it embody exclusively the law of human ethical progress? Ethical conduct, it is true, is an outgrowth of natural mental constitution; it differs among individuals, among families, among races; physical necessities, and conditions of environment direct it. But the knowledge of right is an intellectual faculty. Ethical life expresses, further, the highest development of humanity. Accordingly, moral conduct has *various* phrases of evolution: the rational as well as the natural, the individual as well as the social; 40 which corresponding motives of utility, egoism, and altruism belong. We find these motives interacting, each predominant in their respective spheres. The rational element has found its expression in generalization, in the formation by far seeing men of ethical codes; the affectional element, the element of Love, has found its expression in beneficent altruism, wherein the filial relation to God forms an abiding motive to action. The faculty of reason and the sentiment of love ensure ethical perfection.

PASSIONS AND MANIAS. FELIX L. OSWALD, M.D. Nos. 81, 84.

Interesting essays in moral physiology, abounding in citations from history and science in support of the positions taken.

NEWS ABOUT THE PLANETS AND THE MOON.....No. 80.

This constitutes a survey of the latest astronomical observations. It includes a brief account of the canals on the surface of Mars, with their various attendant phenomena; the rotation of Jupiter; the temperature of the moon; and the strange light-phenomena recently observed in the neighborhood of Saturn.

SOCIOLOGY AND ECONOMICS.

HENRY GEORGE AND LAND TAXATION. WHEEL-
BARROW.....No. 73CORRESPONDENCE UPON THE DOCTRINE OF HENRY
GEORGE.....Nos. 79, 80, 82, 84.

The criticisms by Wheelbarrow, touching the doctrines of Henry George, have evoked much comment and discussion. The main bulk of the correspondence relative to this question, remains still unpublished; showing the wide-spread interest taken in the subject, and the undoubted popularity of Mr. George's theories. The main endeavor of our correspondents seems directed towards demonstrating Wheelbarrows ignorance and misunderstanding of the great economist's position. This Wheelbarrow seeks to refute in a letter in No. 82.

HISTORICAL AND CRITICAL.

THE DILEMMA OF DOUBLE ALLEGIANCE. GEN M. M
TRUMBULL.....No. 81.

The article by Gen. Trumbull is opportune. Its tone and position is commendable. Amid the chauvinistic fanfaronade of demagogic statesmen and bellicose newspapers, evoked by petty irritations over Samoa coal-stations and bait for cod-fish, the thoughtful citizen of foreign birth must often feel the appalling meaning that the problem of double allegiance embodies. "What is the ethics of patriotism that must guide us in case of actual war?" "The duty of men embarrassed by the ties of double allegiance," says Gen. Trumbull, "is to stand bravely by the republic whatever comes, but they ought to unite their moral and political influence to promote the settlement of all international disputes by peaceful arbitration." The question has excited much comment from the press throughout the country.

MAKING BREAD DEAR.

A CRITICISM OF WHEELBARROW, BY A SYMPATHIZER.

IN Number 78 of your paper, I read an article signed "Wheelbarrow." Too easily affected perhaps by the unfortunate condition of my fellow-men, I was greatly moved by the description given by Wheelbarrow of the hard lines in which his life is set. To be forever pushing a wheelbarrow at the meagre remuneration of \$1.25 per day, with a hard taskmaster standing near (at much higher wages per diem), forever crying, "Fill up the barrow," is indeed an unhappy lot. But this is only part of the picture he drew. While he secures for his toil only the small wages attaching to this most common kind of human labor, there is, according to him, a wicked design on the part of those superior to him in position, to render his pittance the most inadequate for his numerous wants, by artificially raising the prices of those things which his necessity demands.

My heart burned with indignation as I read his eloquent, if somewhat ambiguous, indictment of society; for he is truly eloquent, and when I read his glowing words, I wondered why he did not turn his attention to the Bar, the Pulpit, or the Press, because in either of these his mental gifts give promise of success; and by his own confession, pushing a wheelbarrow is hard, monotonous, and unprofitable work. But this reflection made the contrast between what he might have been, and what he is, the more painful, and served only to aggravate the wickedness of those who try to oppress him. With these thoughts in mind I read again his pungent article. On the second reading, doubts arose in my mind. I asked myself the question, "Is this the statement of real fact, or is it a sketch in which a fervid imagination has outrun sober fact and reasonable judgment?" This I determined to ascertain if possible. I took the following extracts as fairly representative of his chief grievances, and said: "If I find this true, I will take his statement for the other specifications."

"All through the summer time, Nature, the bounteous mother, covers our share of the earth with a carpet of grain, resplendent in green and gold, while bands of criminals are permitted by the law to discount it and corner it, to bewitch it, and bedevil it, that it may become costly and scarce to the workingman. The

guilty profit goes to them, and with it they corrupt our laws in the very capitol where they are made.

"While one gang of food gamblers raises the price of bread, another gang raises the price of meat. * * * As making bread dear is morally a crime, let us make it a crime by law; let us build new penitentiaries to accommodate those vermin of trade who make dear the food of the poor. They are the lineal descendants of the sordid Egyptian speculators who tried to corner all the corn in Egypt, because there was a famine in the land of Canaan."

Determined to be thorough in my examination of the matter, I called upon a farmer friend, showed him the article, and asked if the farmers were engaged in the wicked combination. He replied: "I know of no combination to make wheat or flour high. I do know that the price is very low—so low as to afford the farmer but little remuneration for his toil. Statistics prove that the average pay to the farmer is about 82 cents per day, or about two-thirds of what Wheelbarrow earns, and the truth is that many from the country are moving into the city to secure, if possible, a more remunerative job, such as Wheelbarrow enjoys." I then called upon a miller who I know is honest. He said: "There is no combination among millers. On the contrary, competition is very fierce. If we get 25 cents per barrel for the use of our mill, and the risk we take, we are satisfied. In fact we do not average so much."

I had anticipated about this form of reply from facts already within my knowledge, and therefore was not much disappointed that in these two places—the farm and the mill—Wheelbarrow's trouble did not originate.

I then went to the Board of Trade. I visited a man, not an operator himself, but well acquainted with all the course of trade and speculation in the form of cereal and other product dealt in in this market.

He read the accusation of Wheelbarrow and said: "This kind of loose talk is hard to answer. It has no real foundation in fact. The only reply possible, is to set forth the real facts; and that requires a great many more words than it is necessary to use in accusing a man of murder, conspiracy, or other crime. No one wants to make bread dear; no one wants to make it cheap. The speculator operates to make money. He

buys hoping for a *rise*, or he sells for future delivery hoping for a *decline*. There can be no buyer without a seller, and no seller without a buyer. If the short seller was too numerous, grain would go down, and bread would be cheap; but the agriculturalist would suffer, and if this influence continued long enough, he would cease to raise wheat, when a reaction would ensue, wheat would be scarce and high, and bread would become dear.

"Against this influence, the speculative buyer offers the only barrier. He is handicapped at the beginning by charges and expenses from which the short seller is free, *i. e.*, if he buys and carries wheat or other property, he is subjected to the cost of storage, interest, insurance, and the risk of deterioration in quality. Both the buyer and the seller are governed by their conclusions, reached from the best examination they can make of the present and prospective quantity of grain, as compared with the present and prospective demand for it, whether for home consumption or foreign exportation.

"One immediate effect of the operations described is to make a continuous cash market for all products so dealt in, and the two forces, it may be safely asserted, operate to bring the average price of wheat to a fair equilibrium under the law of supply and demand. At least it is true that in an open market such as usually exists, the current price is an expression of the agreed opinion of the world as to the fair value of the article. I say world, because the world trades in our market. If the price is for a moment higher than any individual trader's opinion of the real price he will offer for sale, and thus affect the price downward. If he thinks it too low, he will buy in the market, and thus influence the market upward. The opinions thus backed by monied risk, are much superior to the *ex parte* notion of Wheelbarrow, or any other person who merely stands off and looks on.

"I might go on and speak about 'corners' so-called," my informant continued, "but perhaps I have said enough."

No, I replied, it is about corners that I especially want to hear, for I suspect that there, if anywhere, will be found the true occasion for Wheelbarrow's severe strictures.

"Well," he said, "I will tell you all I know about them. I have already spoken about an open market, meaning by that a market which is under no individual's or syndicate's control. Now, it occasionally happens, at infrequent intervals, that some one man, or a small group acting together, will take advantage of a moment when the actual stock of wheat or provisions in store is small, and secretly buy it all. With the actual property thus in possession, they will make contracts of purchase with the unsuspecting seller for

future delivery. When the contract is due, the seller must buy in what he had previously sold, but as the stock is already in his adversary's hands, he can buy only of him, and at his price. The short seller is thus occasionally caught and put in chancery by the wily, and perhaps unscrupulous, dealer, who has thus cornered the market.

"But in the nature of things, such a condition must be of short duration. The operator who has cornered the market must buy all that comes. The advancing price, which is its inseparable feature, brings into the market the reserve from all points, and under the rapidly increasing load, the cornerer usually finds himself unable to continue to buy, and is at last obliged to let go of his holdings, suffers enormous losses, and frequently involves himself in ruin.

"Some years ago, Jim Keene, of New York, tried the game. He lost two millions of dollars or more. Afterward McGeoch tried it. His losses amounted to millions, and he retired a ruined man. Ten years ago, a Cincinnati clique tried it. They lost enormously, and some of those interested are now in the penitentiary, where Wheelbarrow says they belong. But those are episodes. They are like raids in the rear of an army, or piratical excursions over ordinary peaceful seas. Their influence is so brief they seldom affect the price of the product to the actual consumer.

"As an illustration; in a celebrated pork corner some three years ago, the price for regular delivery on change rose to \$35 per barrel, but the consumer could buy for use or shipment to other parts of the country for \$14 per barrel in any quantity he desired. This is a brief, but substantial statement of the fact. They cannot be said to make bread dear as Wheelbarrow alleges, for in a swing of months or years, their influence is next to nil in that direction."

Having thus exhausted the chief specification of Wheelbarrow, I did not pursue the question into other fields. My own mind was greatly relieved, and I have thought others among your sympathizing readers might be similarly affected by this perusal.

Part of Wheelbarrow's unhappiness arises from the alleged fact that since "I first worked with the wheelbarrow * * * wealth has multiplied fourfold or more. Of that multiplied wealth I get no share at all." Now, he might be asked in what way he has contributed to increase wealth fourfold. As a wheeler of earth, has his power increased fourfold, or even doubled, over his predecessor in the same line a thousand years ago? He can walk no faster, he is no stronger, and he works fewer hours than his brother laborer of a century ago. By what right then can he demand that he share in an increase which he did not contribute to produce? As a matter of fact, however, he *has* shared in the larger productivity which society as a whole has

brought about. When he went to railroading, "my wages was a dollar a day; it is now from a dollar and a quarter to a dollar and a half." This itself is a gain of from 25 to 50 per cent., and if he will take note of the table of prices for the things which he consumes, he will find the purchasing power of his dollars has increased.

I dislike to characterize his essay in unfriendly terms, but it is that kind of writing, now so much in vogue from labor agitators and would-be reformers, which hurts the cause it would help, confuses the true issues, obscures sound judgment, and helps to paralyze the efforts of those who would gladly aid the humbler members of society to attain a better hold on life.

THE INTERPRETATION OF THE VEDA, AND THE HINDU EPIC.

BY H. OLDENBERG.

WE may say, that the greatest undertakings planned and the most important results achieved in the field of Sanskrit research, are linked with the names of German investigators. If we add that this could not easily be otherwise, it is not from national vanity; we should but express the actual facts of the case, based upon the development of the science. It was natural that the first movements toward the founding of Hindu research, the first attempts to grasp the vastly accumulated material and find provisional forms for it, should have been the work of Englishmen, men who spent a good part of their lives in India, and were there brought in constant contact with native Sanskrit scholars. But not less natural was it that the honor of instituting further progress and gaining a deeper insight should be accorded to Germans. The two fields of knowledge by which, especially, life and power were imparted to Hindu investigations were and are essentially German. These are comparative grammar, which we may say was founded by Bopp, and that profound and potent science, or perhaps more correctly expressed art, of philology, which was practiced by Gottfried Hermann, and likewise by Karl Lachmann, the enthusiastic follower of Lessing—an art full of acute and purposeful ability, exact and truthful in small matters as in great. Representatives of this philology, moved to antipathy by many characteristic features of the Hindu spirit, and not the least influenced by the assertion that Latin and Greek grammar has this or that to learn from the Sanskrit, might meet the new science of India with reserve or more than reserve. Still this could in no wise alter the truth that the study of Hindu texts, the investigation of Hindu literary remains, could be learned from no better teachers than from those masters who had succeeded in improving and interpreting the classical texts with unerring certainty and excellence of method.

It was a Leipsic disciple of Hermann and Haupt who, at the instigation of Burnouf, in 1845, in Paris, conceived the plan of publishing the Rig Veda with the commentary of its Hindu expounder, the abbot Sayana, who flourished in the 14th century after Christ. This was the great work of Max Müller, the first of those fundamental undertakings on which Vedic philology rests. It was necessary above all to know how the Brahmins themselves translated the hymns of their forefathers, which were preserved in the Rig Veda, from the Vedic language into current Sanskrit, and how they solved the problems which the grammar of the Veda presented, by the means their own grammatical system offers. Herein lay the indispensable foundation of all further investigation. It was necessary to weigh the Hindu *traditions* concerning the explanation of the Veda, which erred in underestimation as well as overestimation, and to test the consequences of both errors, in order finally to learn the art of scientifically estimating them. This constitutes the great importance of Max Müller's work extending through a quarter of a century (1849-1874). To complete was easy, but to begin was exceedingly difficult; for most of the grammatical and theological texts which formed the basis for Sayana's deductions, were, when Max Müller began the work, books sealed with seven seals.

A few years after the first volume of Max Müller's Rig Veda appeared, two other scholars united in a work of still greater magnitude. It has long since become to all Sanskritists the most indispensable tool for their labors. I refer to the Sanskrit dictionary, compiled under the commission of the Academy of St. Petersburg, Russia, by Roth and Böhtlingk. It was intended to make a dictionary for a language the greatest and most important part of whose texts were still not in print. The work was similar to that which the Grimm Brothers began at the same time for the German language. Roth undertook the Vedic literature, the foundation of the whole; Böhtlingk the later periods. Friendly investigators, and especially Weber, helped them by bringing into use the known and accessible texts or manuscripts that were serviceable to them. The most important thing was, that the Veda had now for the first time—setting aside a few previous studies—to be gone through with a view to lexicography. The explanations which the Hindus themselves were wont to give of the words of the Vedic language were regarded as a valuable aid for understanding it. But the matter did not rest here. "We do not hold it," said the two compilers in their preface, "to be our task to acquire that understanding of the Veda which was current in India some centuries ago; but we seek the sense which the poets themselves gave to their hymns and maxims." They undertook "to get

at the sense from the texts themselves, by collating all the passages related in word or meaning." In this way they hoped to re-establish the meaning of each word, not as a colorless conception, but in its separateness and therefore in its strength and beauty. The Veda was thus to re-acquire its living sense, the full wealth of its expression. The thought of the earliest antiquity was to appear to us in new forms full of life and reality.

The execution of this work, carried on with tenacious industry and brilliant success for four and twenty years (1852-1875), did not fall short of the magnitude of the plan originally conceived. In minor points we find it easy to point out numerous deficiencies and errors. The two compilers well knew that without that spirit of boldness which does not stand in fear of unavoidable errors, it were better never to undertake their task. In face, however, of the great value of that which they have accomplished, all faults sink into insignificance.

What a chasm separates their work from that of their predecessor, Wilson!* In Wilson's work there is little more than a fair enumeration of the meanings which Hindu traditions assigned to the words; for his dictionary the Veda scarcely exists, if it does so at all. Here in the work of Roth and Böhtlingk on the other hand, is brought to light the immense wealth, replete with oriental splendor, of the richest of all languages; the history of each word, and likewise the fortunes that have befallen it in the different periods of the literature and have determined its meaning, are brought before our eyes. The difference between the two great periods in which the development of Hindu research falls, could not be incorporated more clearly than in these two dictionaries. In the one instance are found the beginnings, which English science, resting immediately on the shoulders of the Indian pandits, has made; in the other is the continuation of English work conducted by strict philological methods to a breadth and depth incomparably beyond those beginnings, and at the head of this undertaking stand German scholars.

To Müller's great edition of the Rig Veda and to the St. Petersburg Dictionary further investigations have been added in great abundance, and these have more and more extended the limits of our knowledge of the Veda. Already a new generation of laborers have taken their places beside the original pioneers in these once so impassable regions. As a whole, or in its separate parts, the Rig Veda has been repeatedly translated. Its equipment of words and forms has been studied from ever new points of view and with ever new questions in mind. To many a picturesque

word of the strong, harsh Vedic language its full weight has thus been given back.

The principles and practices according to which the old collectors and revisers of the Veda text proceeded, have been examined by us; and consequently we are able to decide what they have received as remains and what they themselves have incorporated into those remains. The readings of the passages quoted from the Rig Veda in the other Vedas have been collected in order to find in them the remains of the genuine and oldest textual form. The religion and mythology of the Veda have been described; the national lives of the Vedic tribes has been portrayed in all its phases. The texts afford the data for such a portraiture of these features that it has justly been said that the description given surpasses in clearness and accuracy Tacitus's account of the national life of the Germans.* Finally an attempt has been made—or rather an attempt will have to be made, for even at this time the work is in its beginnings—to discover amid the masses of Vedic prayers and sacrificial hymns something which must be an especially welcome find to scientific curiosity—the beginning of the Indian Epic.†

In a time so rich in poetry and reverence for poetry as the epoch of the Rig Veda was, the pleasure of romancing must also have produced its blossom of poetic fancy. Undoubtedly this was so. Short narratives, short hymns must then have existed, enclosed, as it were, in narrow frames. Thus, in general, are the beginnings of epic poetry shaped, before poetic ability rises and ventures to narrate in wider scope and with more complicated structure the fate of men and heroes. It seemed as though those beginnings of the Indian epic were lost. And still they were preserved, though to be sure in a peculiarly fragmentary form. In the Rig Veda there is many a medley of apparently disconnected verses in which we have thought to discover the accumulated sweepings of poetic workshops. In fact they are fragmentary remains of epic narratives, verses, which were once couched in prose form—narratives in prose, and speeches and counter-speeches in verse, just as, often, in Grimm's fairy-tales when the poor daughter of the king or the powerful dwarf has to speak an especially weighty or touching word, a rhyme or two appears.

Now, the Vedic tale-tellers impressed in their memory only the verses having a fixed form. Each new narrator would repeat the prose with new words, and finally its subject-matter would pass almost wholly

* H. Zimmer: *Altindisches Leben: die Cultur der vedischen Arier*. (Ancient Indian Life; the Civilization of the Vedic Aryans.) Berlin: 1879, p. vii.

† The remarks here made on the beginnings of the Indian Epic, rest on conceptions which I have before briefly sought to establish. *V. Zeitschrift der Deutschen Morgenländ. Gesellsch.*, 1885, p. 52, et seq.

* Wilson's dictionary appeared in 1819; a second edition in 1832.

into forgetfulness, so that only the verses would survive, sometimes as a series of dialogues, long and copious enough for us to understand their connection with the whole, and sometimes as unrecognizable fragments, which supply as little respecting their antecedents and connections in which they belong as—to keep the same comparison as above—a couple of rhymes in one of Grimm's fairy-tales would represent of the whole tale.

It may be permitted, for the sake of making clear what has been said, to cite here a passage from one of those old narratives whose connection, at least as a whole, may be conjecturally determined.* The scene is between gods and demons, its subject is the great battle which was fought in heaven, the thunder fight, which for the strife-loving spirit of that age was the pattern of their own victories. Vritra, the envious fiend, kept the waters of the clouds in captivity, that they might not pour down upon the earth; but God Indra smote the demon with his thunderbolt and let the liberated waters flow. Indra—this must have been said in the lost prose introduction to the narrative—felt, as he entered the battle, too weak for his terrible opponent. The gods, faint-hearted, withdrew from his side. Only one offered himself as an ally, Vāyu (the wind),† the swiftest of the gods, but he demanded as a reward for his fidelity, part of the sacrificial draught of Soma, which men offer to Indra. Vāyu speaks:

"Tis I. I come to thee the foremost, as is meet;
Behind me march in full array, the Gods.
Givest thou me, O Indra, but a share of sacrifice,
And thou shalt do, with my alliance, valiant deeds of might."

Indra accepted the alliance:

"Of the honied draught I give thee the first portion;
Thine shall it be; for thee shall be pressed the Soma.
Thou shalt stand as friend at my right hand;
Then shall we slay the serried hosts of our foe."

Then a new person appears, a human singer. We know not whether a definite one among the great saints of that early time, the prophets of the later generation of singers, was thought of or not. He wished to praise Indra; but can Indra now be praised? The hostile demon is not yet conquered; doubts as to Indra and his might come to the singer. He says to his people:

"A song of praise bring ye who long for a blessing,
If truth be truth, sing ye the praise of Indra."
"There is no Indra," then said many a one,
"Who saw him? Who is he whom we shall praise?"

Then Indra himself gives answer to the weak-hearted:

"Here stand I before thee, look hither, O Singer;
In lofty strength I tower above all beings.
The laws of sacred order make me strong;
I, the smiter, smite the worlds."

* Rig Veda 8, 100. I omit a few verses of obscure meaning, and say nothing of difficulties, for which this is not the place to give a solution.

† He is also called Vāta. This name has been identified—though the correctness of this is highly questionable—with the German name Woden.

The confidence of the pious in their God is restored, his hymn of praise is sounded. And now Indra enters the conflict. The falcon has brought him the Soma, and in the intoxication of the ambrosial drink, the victorious one hurls his thunderbolt at the demon. Like a tree smitten by lightning, falls the enemy. Now the waters may flow forth from their prisons:

"Now hasten forth! Scatter thyself freely!
He who detained thee is no more.
Deep into the side of Vitra has been hurled
The dreaded thunderbolt of Indra.

"Swift as thought sped Indra along;
Pierced into the citadel, the brazen.
And up to heaven, to the thunderer,
The soaring falcon bore the Soma.

"In the sea the thunderbolt rests,
Deep engulfed in the watery billows.
The flowing and ever-constant waters
To him bring generous gifts."

I pass over the difficult conclusion of the poem—the creation of language by Indra after the battle with Vitra. One fourth of the languages that exist on earth, Indra formed into clear and intelligible speech; these are the languages of men. The other three fourths, however, have remained indistinct and incomprehensible; these are the languages that quadrupeds and birds and all insects speak.

This is one of the early narratives of the Hindus concerning the deeds of their gods and heroes. We must not endeavor here, to restore the lost portions written in prose which served to connect the strophes. To make the modern reader clear as to the connection of the verses, another method of expression must be chosen than that peculiar to the narrators of the Vedic epoch. As it appears, they were content with recounting the facts they came across, or rather with recalling them to their hearers, in short and scanty sentences. The poems incorporated in the narrative—which has been shown by the poem of Indra's battle—are not wanting in flights of poetic eloquence. Without the finer shades of human life, it is true, yet in earnest, simple power, like mountains or old giant trees, stand the productions of that poetry. What took place in them, is similar, nay more than similar, to the occurrences taking place in nature. For as yet the primitive *natural* significance of those gods has not been veiled by the human vesture which they wore; and in the narratives of their deeds the great pictures of nature's life with its wonders and its terrors are generally projected. The duty of bringing together and interpreting such fragments of this the oldest epic, Vedic research must regard as its most fruitful, though perhaps not its easiest, task.

ETHICS AND NATURAL SCIENCE.

THE beginning of ethics is *thought*. The animal who cannot think or reason cannot be called an ethical being. When man begins to think, he commences to

understand his relations to others and thus learns his duties. He formulates his duties in general principles and regulates his actions according to maxims of universal application. In this way only can he place himself and his life in harmony with the order of All-existence.

When we reflect a moment upon what we owe our ancestors, we shall soon find that we owe them all we have and even more: we owe them all we *are*. What are we but the accumulated activity of all our ancestors from the very beginnings of life, the monad and the monad's struggles for existence included? Our nineteenth century civilization is not a revolution which has introduced any new idea that inverts or destroys the thoughts, ideas, or aspirations of former centuries. The most advanced view, however different from the old views, is a further evolution of the past.

The recognition of this truth is the essence of historical research, and those who are most advanced in the culture of true progress, who acknowledge the principle of scientific investigation in ethics and religion, those who are decided to modernize their morals and adapt themselves to the spirit of the dawning future, should be the first to understand this truth. Yet many radical thinkers overlook it. Through their opposition to the errors of the past they become blind to its merits. Only by understanding the connection of the present with the past will they be able to do justice to the cause which they defend, for they can gain justice for themselves only by doing justice to others, and the just claims of the present can only be established by showing that they are the logical outcome of the past.

Ethics is not, as some modern philosophers try to make us believe, an arithmetical example by which to calculate how we can purchase, at least sacrifice, the greatest amount of happiness. This barter morality of hedonism is a pseudo-ethics which indeed would make true ethics impossible.

The pseudo-ethics of hedonism starts from the wrong idea that man lives solely for being or becoming happy. If this were true, the great pessimist Schopenhauer would be right in saying that life is a failure and that existence is not desirable because a life without trouble and pain, a victory without battle, a conquest without wounds and anxiety, are impossible. Ethics is so much at variance with man's craving for happiness that if man lived merely to be happy there would be no ethics whatever. Ethics indeed is taught to counteract the dangerous, although perhaps inborn and natural, craving for happiness.

The beginning of ethics is to reflect upon ourselves, our surroundings, and our actions. Before we act we must stop to think. The brute animal follows his impulses; so does the savage. The thoughtful man

takes into consideration all possible results of his action; and however dimly at first, he soon learns that his person is intimately connected with his surroundings, with his fellow-beings, and with nature.

Even a savage knows that he is no absolute entity, no unit by himself. His very existence is the product of his parents, and his life is sustained through certain natural conditions by a constant struggle in which he is aided or hindered by his fellow-men. His relation to his fellow-men, and his dependence upon nature which yields to him substance that maintains his life, teaches man that he has some duties to perform, which if neglected will prove disastrous to himself and his fellow-beings. The *relations* in which man stands to others imply *duties*; and the man who attends to these duties is moral.

When man earnestly attends to what he recognizes as his duties, he will progress and in consequence thereof his comfort and prosperity will increase. His pleasures will be more refined; his happiness, his enjoyments, and recreations will be better and nobler.

The increase, or rather refinement of happiness, however, cannot be considered as the ultimate aim of ethics, for pain and affliction increase at the same rate, because man's irritability, his susceptibility to pain, grows with the growth of his intellectuality.

The pain of a more civilized man will be more intense than that of a savage, and it is an undeniable fact that people of a lower degree of culture are as a rule merrier than the more educated classes. There is sufficient occasion in this country to observe the glad and hearty happiness of the negro, who is so easily satisfied. In comparison with the African the more cultured American of European ancestry must appear morose.

If all the advancement of our civilization had no other object than to produce a greater amount of happiness, the anthropoids would have better remained in their forests and have lived upon the tropical trees, subsisting on their fruit. They would thereby have better attained this end. Therefore we maintain that the elevation of all human emotions, whether they are painful or happy, the elevation of man's whole existence, of his actions and aspirations, is the constant aim of ethics.

* * *

THE hostility which prevails between scientists on the one side and moral teachers on the other is produced through a misunderstanding. The moral teacher, and especially the clergyman, is afraid lest science undermine the principles of ethics. The doctrine of the survival of the fittest appears to contradict the principle of morality. And the scientist in his turn does not find the moral law as it is commonly preached in the pulpit, justified in nature.

Professor Huxley says :

"From the point of view of the moralist the animal world is on about the same level as a gladiator's show. The creatures are fairly well treated, and set to fight—whereby the strongest, the swiftest, and the cunningest live to fight another day. * * *

"In the cycle of phenomena presented by the life of man, no more moral end is discernible than in that presented by the lives of the wolf and of the deer. * * *

"As among these, so among primitive men, the weakest and stupidest went to the wall, while the toughest and shrewdest, those who were best fitted to cope with their circumstances, but not the best in any other sense, survived. * * *

"The history of civilization—that is, of society—on the other hand, is the record of the attempts which the human race has made to escape from this position. * * *

"But the effort of ethical man to work toward a moral end by no means abolished, perhaps has hardly modified, the deep-seated impulses which impel the natural man to follow his non-moral course." * * *

Professor Huxley adds with special reference to the civilization of the English nation of to-day :

"We not only are, but, under penalty of starvation, we are bound to be, a nation of shopkeepers. But other nations also lie under the same necessity of keeping shop, and some of them deal in the same goods as ourselves. Our customers naturally seek to get the most and the best in exchange for their produce. If our goods are inferior to those of our competitors, there is no ground compatible with the sanity of the buyers, which can be alleged, why they should not prefer the latter. And, if that result should ever take place on a large and general scale, five or six millions of us would soon have nothing to eat. We know what the cotton famine was ; and we can therefore form some notion of what a death of customers would be.

"Judged, by an ethical standard, nothing can be less satisfactory than the position in which we find ourselves. In a real, though incomplete, degree we have attained the condition of peace which is the main object of social organization (and it may, for argument's sake, be assumed that we desire nothing but that which is in itself innocent and praiseworthy—namely, the enjoyment of the fruits of honest industry). And lo ! in spite of ourselves, we are in reality engaged in an internecine struggle for existence with our presumably no less peaceful and well-meaning neighbors. We seek peace and we do not ensue it. The moral nature in us asks for no more than is compatible with the general good ; the non-moral nature proclaims and acts upon that fine old Scottish family motto, 'Thou shalt starve ere I want.' Let us be under no illusion, then."

If the unitary conception of the world is true, that all existence is but one great continuous whole ; that all difference is but variety in unity ; that one truth is in harmony with all other truths as every part of existence is related to the whole existence of the One and All :—if this is true, how can there be a difference between the moralist's and the naturalist's views? Should we not declare *a priori* that there can be no contradictory truths? Either the naturalist or the moralist, perhaps both, are wrong.

With all due respect to the facts presented by Professor Huxley, we must object to the conclusion at which he arrives. Professor Huxley's view of morals

is based on the error that the wolf is immoral while the sheep is moral. The strong one is supposed to be an evil-doer, simply on account of his strength, while the weak one is supposed to be *good* simply on account of his weakness. Not the hero is glorified that "fights the good fight of faith," but the martyr that allows himself to be slaughtered without resistance.

This ethics has long been fostered by Christian moralists, because unfortunately Christ was compared to a lamb that is sacrificed, and because, in one of his allegories, Christ compares the good to sheep whom he will place at the right hand. The allegory is misinterpreted. It is not the weakness, not the inactivity, but the purity of the sheep that is approved by Christ. How much is blamed, in another parable, the inactive and cowardly servant who buried the talent that was entrusted to him !

This ovine morality has detracted much of the pith and strength from Christian ethics. It has made it tame and weak and even despicable. Morality is not as many lamb-souled moralists pretend, the negative quality of suffering ; morality according to modern ethics is the positive virtue of energetic activity. Ours is, as the scientist correctly states, a struggle for existence ; and those who consider it meritorious to succumb to injustice and violence justly go to the wall. Their enemies, unjust though they may be, are comparatively more moral, for they are their superiors in the virtue of courage which gives them strength and power.

Prof. Huxley describes how the moralist, in the effort to restore harmony, tries to account for the iniquities in this world. He says :

"From the theological side, we are told that this is a state of probation, and that the seeming injustices and immoralities of Nature will be compensated by and by. But how this compensation is to be effected, in the case of the great majority of sentient things, is not clear. I apprehend that no one is seriously prepared to maintain that the ghosts of all the myriads of generations of herbivorous animals which lived during the millions of years of the earth's duration before the appearance of man, and which have all that time been tormented and devoured by carnivores, are to be compensated by a perennial existence in clover ; while the ghosts of carnivores are to go to some kennel where there is neither a pan of water nor a bone with any meat on it." * * *

This would indeed be a consistent consequence of a soft-brained and weak-hearted system of ethics, which praises the innocence and meritoriousness of mere suffering, and depicts as the ideal of morality a millennium of eternal peace, where the struggle for existence is unknown, where no labor or painstaking is necessary and all time is spent in the glorification of an all-wise Creator.

Such a state of absolute perfection is impossible and we must smile at the ingenuousness of those philosophers who pretend to teach modern ethics and still

adhere to the old millennium idea of a life of perfect adaptation where universal happiness will prevail.

The error in this Utopian idea is easily seen if we understand that the struggle for existence is inherent in nature. The struggle for existence is not only not in contradiction to ethics, it is on the contrary its most important factor, which must be taken into consideration and *is* taken into consideration by the monistic view of ethics. The old ethical view demands that man shall not resist evil; that he shall leave off fighting and humbly allow himself to be trodden under foot. But the ethics of monism does not make man unfit for life, it renders him fitter in the struggle for existence. It teaches that so long as we are in harmony with the One and All of nature, so long as we remain in accord with natural laws, we shall be best able to resist evil. And this we can only do by constantly exercising our faculties and strengthening brawn and brain for the continued struggle,—which will cause us, it is true, much trouble and uneasiness, but at the same time will raise us to a higher level; it educates us and enhances the work of our existence.

The moral law is a natural law, it may be contrasted to, but does not stand in contradiction with, the other natural laws of a lower order. The deeper we investigate the more we shall be convinced that benefits acquired by injustice will prove to be injurious in the end: very often they are even the beginning of ruin. Truth and justice are the most powerful weapons in the struggle for existence. Truth and justice will always conquer in the end. It often takes more time than the life of a single individual to see the triumph of truth; but we can be sure, even if the defenders of truth and justice die, if they succumb to their immoral enemies, that truth and justice will survive.

It is the belief in truth and justice which lies at the bottom of the old religious and ethical views. This belief was a faith, but took the shape of a creed. The moral quality of a religious virtue soon ossified as a system of dogmas. It was mixed with superstitious notions, with anthropomorphic ideas, and with unwarranted phantastical expectations of a compensation in a supernatural Utopia. It grew powerful because, after all, it was more in harmony with truth than the views of those who saw only the surface of natural facts and could detect no order and no moral law in nature. But it became intolerable through the errors taught and the wrongs committed.

If, now, new ideas triumphantly break their way, let us remember that the new ethics and the religion of the future do not come 'to destroy, but to fulfil.' The present is the product of the past and the future will be the product of the present. A Latin proverb says, *Sic nos non nobis!* It is we who stand here as the rep-

resentatives of humanity, but it is not for ourselves, nor for the gratification of personal vanity. It is we of the nineteenth century, but not by the wisdom of the nineteenth century, which would not exceed the wisdom of former ages if it were not benefited by their experience. Nor do we work and struggle to benefit ourselves. As our ancestors worked and struggled for us, so we have to struggle and fight for future generations.

Sic vos non vobis! Bear in mind it is you who work for the advancement and elevation of the human mind. But it is not you or you alone that you aspire for; it is humanity which is represented in you.

All life on earth forms one great, unbroken chain, one continuous whole, the unity and law of which we comprise in the formula of evolution. Let us regard ourselves as the representatives of this great whole, let us faithfully act according to this view and we need not trouble for the rest. Our actions will be moral and we shall at the same time be allied to those powers of nature which grant the strength of survival and represent advancement, progress, and the elevation of humanity. This ethics is in harmony, not at variance with natural science, and this is not the destruction but the fulfilment of the old religious faiths and their ethical aspirations.

P. C.

CORRESPONDENCE.

GROUND-RENT AND LAND-VALUES.

To the Editor of THE OPEN COURT:—

WHEELBARROW says in his article in THE OPEN COURT of March 21, on "Who makes the 'Land Values' of a Farm?" in speaking of the farm of his old acquaintance Tom Clark:

"Now, which of the ingredients of this farm shall bear the single tax? Is it the breaking of the wild sod? Is it the fence, the barn, or the apple-trees? This is a fair question, and it ought to be fairly answered. It is never answered. It is evaded thus: 'We do not propose to tax any of these improvements nor the land itself; we only propose to tax the *land-value* of the whole farm.' In that evasion the single tax on values' theory vanishes 'like the feverish dream of a summer's night.'"

The answer to this question is exceedingly simple and is never evaded by any intelligent Single-taxer. Neither "the breaking of the sod," nor "the fence, the barn, nor the apple-trees" will bear any of the single tax.

1. If Tom Clark's farm is worth *nothing*, as Wheelbarrow says, without Tom Clark's improvements it will be taxed *nothing* under the Single-tax regime.

2. If it is worth the dollar and a quarter an acre which Tom Clark paid for it, without his improvements, it will be taxed upon that much value.

What Tom Clark has done to make the farm more *useful* does not enter into the question of what renting *value* the bare, unimproved land has. The farm will be taxed upon its bare rental value without improvements.

If Wheelbarrow cannot separate the idea of "the value of land from the land," as he confesses, he certainly ought to understand that one piece of land has more renting value than another, and he ought to be able to understand so simple a proposition as having *ground-rent* and nothing else paid into the public treasury. That is all there is to the "George theory." It is simply to pay *ground-*

rent and nothing else into the public treasury. Wheelbarrow does not understand that : if he does he would not have written as he did about Tom Clark's farm. But why should Wheelbarrow or any one else find any difficulty in understanding what it means to pay *ground-rent* and nothing else into the public treasury ? Why should Wheelbarrow ask whether the single-tax would fall on Tom Clark's fence, or barn, or orchard ? Tom Clark would simply have to pay *ground-rent* no matter how *useful* his farm was to him, if it had no selling or renting *value* over and above the value of his improvements Tom Clark would pay *no taxes*. The single-tax means simply *ground-rent*. If a man does not know what *ground-rent* is he cannot understand the single-tax.

Wheelbarrow may have studied "Progress and Poverty" a great deal but he certainly does not understand Mr. George. And yet why should he find the least difficulty in understanding him ? Is it so hard to understand what *ground-rent* is ?

Respectfully Yours,

NEW YORK.

HUGH O. PENTECOST.

A FARMER ON HENRY GEORGE.

To the Editor of THE OPEN COURT.

SIR:—A word about the "George Theory." If the object be to increase the number of land holders it *almost* atones for the utter lack of judgment in the method designed to bring it about. I am not speaking of cities ; my objections only apply to farming communities. Land owners are "pirates, robbers, and parasites," are they ? It does look so, perhaps, to Mr. George, but my opinion is that intelligent farmers owning their own land are guardian angels. The rural "greeny" is often made the material of a joke in the "funny papers," but the intelligent farmer often has occasion to smile at the ignorance of the "smart" city people concerning rural economy. James Malcolm (p. 1507 of THE OPEN COURT) hints that the producing capacity of nature—meaning the soil—is infinite. If this is true it is true in the same sense that nature in man is capable of resisting disease. Let man fail to conserve his vitality he soon falls a prey to disease. Just so with land. This may seem to be false as regards the rich prairie soil of the west, but wait. Ohio was said to have inexhaustible soil and where is it now ? About here, unless a very slow rotation of crops is employed, pound for pound of potash and phosphoric acid taken from the soil must be restored to the soil to retain its fertility. Even when rotation *is* employed large quantities must be used. And also of our land—not very hilly—five sixths at least cannot be tilled more than one half the time for it would wash away. Instances are all about us of *temporary* farmers—not through ignorance but by *greed*—bringing farmers down to sterility in a very few years. The true farmer "improves" his holidays in quite a different line from that which is generally called "improvements," and the single tax *cannot* be adjusted to meet this contingency. The Desert of Sahara is a notable example of failure to conserve the soil's fertility.

No ! If you take away land ownership you pull down the foundation—the fertility of the soil—on which the whole country rests. You will be unjust to farmers but your injustice will not be confined to them. When the foundation falls, not only the sills of the house—the farmers—but the whole house falls. It would be different at the equator where bread and fruit grow without ploughing up the soil, and I advise Mr. George and his followers to go there for I think his theory would suit there to perfection. Again no ! Limit ownership to 100 acres, to 10 acres, even to one acre, if it must be done, but let us *own* that acre and if you tax that, tax our *buildings* too.

Yours Truly,

ONE OF THE LAW'S "INFANTS."

MILL GREEN, Md.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXVII.

OLD ACQUAINTANCES.

SINCE the conversation upon the Roman emperors, the Sovereign had withdrawn for a few days from his Court. He was ill. His nervous prostration, as the physicians declared, was the usual consequence of a cold. Only a few privileged persons—among them Master Knips—had access to him during this time, and they had no cause to rejoice in their confidential position, for it was difficult to deal with the princely invalid.

To-day the Sovereign was sitting in his study ; before him stood an old official, with a weazen face, reporting the daily occurrences of the capital, opinions which were expressed in public places concerning the Sovereign and his illustrious house, small scandalous family anecdotes, also observations that had been made in the palace to which the Princess had gone within the last few days, and the persons she had seen there. Prince Victor paid daily visits to the Baroness Hallstein, and passed the evening with the officers of his former regiment ; he had returned unexpectedly that morning.

"How do things go on in the Pavilion ?" asked the Sovereign.

"According to the account of the lackey, there have been no visitors from the city, nor any letters ; everything as usual in the afternoon. When the strangers were sitting in front of the door, the lady had spoken of a journey to Switzerland, but her husband replied that there could be no thought of it until he had finished his business. Then there had been an uncomfortable silence. In the evening both attended the theatre."

The Sovereign nodded, and dismissed the official. As he sat alone, he pushed his chair against the wall, and listened to the sound of a small bell which, from the further end of the room, was scarcely audible ; he hastily opened the door of a niche in the wall, and took out the letters which a confidential secretary had sent up through a tube from the lower story. There were various handwritings : he passed quickly through the contents. At last he held a bundle of children's letters in his hand. Again he laughed. "So the great ball has burst already." His countenance became serious. "A genuine peasant, he has no sense for the honor of having the top-boots of a prince among his fields." He took another letter. "The Hereditary Prince to his sister. It is the first letter of the pious John Patmos, saying nothing, as if it had been written for me. That may possibly be so. The con-

* Translation copyrighted.

tents are scanty and cold. He expresses the wish that his sister also may pass a pleasant time in the country. We wish the same," he continued, with good humor; "she may pluck flowers and talk with scholars about the virtues of Roman ladies. This wish shall be fulfilled by all parties." He laid the letters back in the niche, and pressed a spring in the floor with his foot; there was a slight rustling in the wall, and the packet glided down.

The Sovereign raised himself from his chair and walked about the room.

"My thoughts hover restlessly about this man. I have received him with complaisance; I have even treated his insane hopes with the greatest consideration, and yet this unpractical dreamer mocks at me. Why did he make this insidious attack on me? He did it with the malicious penetration of a diseased person, who knows better than a sound one what is deficient in another. His prating was half vague reflection and half the silly cunning of a fool who also carries about him a worm in his brain. It does not matter: we know one another, as the Augur knew his colleagues. Between us a family hatred burns, such as can only exist between relations—an enduring, thorough hatred, which conceals itself beneath smiles and polite bows. Trick for trick, my Roman cousin. You seek a manuscript which lies concealed with me, but I something else, which you would withhold from me."

He sank back in his chair, and looked timidly towards the door; then put his hand into a pile of books, and drew out a translation of Tacitus. He tapped the book with his finger.

"He who wrote this was also diseased. He spied incessantly into the souls of his masters; their pictures so filled his fancy, that the Roman people and the millions of other men appeared unimportant to him; he suspected every step of his rulers, yet neither he nor his generation could do without them. He gazed at them as on suns, the eclipse of which he investigated, and which reflected their light on him, the little planet. He began to doubt the wisdom of the order of things; and that to every human mind is the beginning of the end. But he had wit enough to see that his masters became diseased through the miserable meanness of those like himself, and his best policy was that of the old High Steward, to bear all with a silent obeisance."

He opened the leaves.

"Only one, whom he has included in his book," he began again, "was a man, whom it moves one to read about. This was the gloomy majesty of Tiberius: he knew the rabble, and despised them, till the miserable slaves at last placed him among the madmen. Do you know, Professor Tacitus, why the great Emperor be-

came a weak fool? No one knows it—no one on earth but me, and those like me. He went mad because he could not cease to be a man of feeling. He despised many and hated many, and yet he could not do without the childish feeling of loving and trusting. A common youth, who had once shown him personal devotion, caught hold of this fancy of his earthly life, and dragged the powerful mind down with him into the dirt. A miserable weakness of heart converted the stern politician of Imperial Rome into a fool. The weak feelings that rise up in lonely hours are the undoing of us all; indestructible is this longing for a pure heart and a true spirit—undying the seeking after the ideal condition of man, which is described by the poet and believed in by the pedant." He sighed deeply; his head sank on the table between his hands.

There was a slight sound at the door. The Sovereign started. The servant announced—"The Grand Marshal von Bergau." The Grand Marshal entered.

"The Princess inquired at what hour your Highness will take leave of her."

"Take leave?" asked the Sovereign, reflecting. "Why?"

"Your Highness has been pleased to order that the Princess shall this morning go to her summer castle for a few days."

"It is true," replied the Sovereign. "I am well to-day, dear Bergau, and will breakfast with the Princess. Will it be agreeable to you to accompany her?" he asked, kindly.

"I am very grateful to my gracious master for this favor," replied the Grand Marshal, honestly.

"What lady has the Princess chosen as her attendant?"

"As your Highness has given her the choice, she has decided upon Lady Gottlinde."

"I agree to that," said the Sovereign graciously. "The good Lady Gottlinde may be invited to breakfast, and you yourself may come also, that I may see you all once more about me before the journey. I have one more thing to say. Mr Werner will follow you; he wishes to examine the rooms and chests of the castle for his scientific purposes. Render him assistance in every way, and show him the greatest attention. I have also a confidential commission for you."

The Grand Marshal made a piteous face, which plainly indicated a protest.

"I wish to win for us this distinguished man," continued the Sovereign. "Sound him as to what place or distinction would be acceptable to him. I wish you to observe that I am most anxious to keep him."

The Grand Marshal, much discomposed, answered: "I assure your Highness, with the greatest respect,

that I know how to value your confidence, yet this commission fills me with consternation; for it exposes me to the danger of exciting the displeasure of my gracious master. I have had opportunities of remarking that one cannot count upon gratitude from these people."

"You must not offer him anything; only endeavor to make him express some wish," replied the Sovereign dryly."

"But if this wish should exceed the bounds of moderation?" asked the Marshal hesitatingly.

"Take care not to object to it; leave it to me to decide whether I consider it immoderate. Send me a report immediately."

The Sovereign gave the signal of dismissal; watched sharply his bow and departure, and looked after the departing gentleman and gravely shook his head.

"He is not old, and yet the curse has overtaken him; he becomes grotesque. Here is another riddle of human nature for you learned gentlemen: the person who has every hour to control his countenance and manner, to whom the most rigid tact and correct forms are necessary in his daily intercourse, should, just when he becomes older, lose this best acquisition of his life, and become troublesome by his weak chattering and unrestrained egotism. You know how to answer, Emperor Tiberius, why your service, clever man, gradually made your servants caricatures of your own character? Now they have revenged themselves on you; it is all right. There is a desperate rationality in the links of the world. O misery, misery, that we should both have so little cause to rejoice at it!"

He groaned, and again buried his head in his hands.

* * *

Shortly after Ilse received the latest letters from home.

"How can the four-leaved clover be lost out of a well closed letter?" she asked her husband. "Luise, on her birthday, found some clover leaves and sent them in her former letter, to bring you good luck. The child is just at the age in which such nonsense gives pleasure. The dried clover was not in her letter, and as she is careless, I scolded her for it in my answer. To-day she assures me that she put them into the envelope the last thing."

"It may have fallen out when you opened the letter," said the Professor consolingly.

"My father is not contented with us," continued Ilse, discomposed; "he does not like it that the Prince has come into the vicinity; he fears distraction in the farm and gossip. Yet why should people gossip? Clara is still half a child, and the prince does not live upon our estate. There is a dark cloud over everything," she said; "the light of the dear sun has ceased

to shine. Nothing but disturbances, the Sovereign ill, and our Hereditary Prince vanishes as if swept away by a storm. How could he go away without bidding us good-bye? I cannot set my mind to rest as to that; for we have not deserved it of him, nor of his courtly Chamberlain. I fear he does not go into the country willingly; and he is angry with me, Felix, because I said something about it. No good will come of it, and it makes me heavy at heart."

"If this trouble leaves you any thought for the affairs of other people," began the Professor, gaily, "you must allow me a small share. I think I have found the hidden castle which I have so long sought. I see from this chronicle that in the last century the country seat to which the Princess is going was surrounded by a forest. I hear that in this remote place much old household rubbish is preserved. I feel like a child on the eve of its birthday. I have made known my wishes to fate, and when I think of the hour when the present shall come to me, I feel the same heart-beating expectation which scares away sleep from the boy. It is childish, Ilse," he continued, holding out his hand to his wife, "I know it is; but have patience with me; I have long wearied you with my dreams, but now it will come to an end. The hope indeed will not come to an end, but this is the last place I have any reason to search for it."

"But if it should again happen that you do not find the book?" asked Ilse, sorrowfully, holding his hand.

A gloomy expression came over the Professor's face; he turned around abruptly, and said, harshly:

"Then I shall seek further. If Fritz had but come!"

"Was he to come?" asked Ilse, with surprise.

"I have requested him to do so," replied her husband. "He answered that his father's business and his relations with Laura prevented him. To him also it appears that a crisis is impending; he has suspicions with respect to the specification that I found here, which I consider unfounded."

"Oh, that he were with us!" said Ilse; "I long for a friendly face, like one who has for many days been traveling through a desert wilderness."

The Professor pointed towards the window.

"This wilderness looks tolerably humanized, and a visitor, such as you desire, seems already coming up to the house."

Ilse heard the rumble of wheels coming along the gravel of the castle road. A carriage stopped before the Pavilion, and the country coachman cracked his whip. The servants hastened to the door; Gabriel opened the carriage door; a little lady descended, gave a parcel to the lackey and a bandbox to Gabriel, and called out to the coachman to inquire about put-

ting up the horses. She hastily ascended the steps, and, as she did so, gazed on the paintings and carved scrolls.

"This is a great pleasure, Mrs. Rollmaus," exclaimed Ilse, delighted, meeting her at the door.

The Professor hastened to the stranger

"My dear Ilse," cried the little lady; "revered and highly honored Professor, here I am. As Rollmaus has been charged with the superintendence of an estate in the neighborhood, in trust for a nephew, and as he has had to travel into this country to put things in order, and will stop only a short time, I thought I would take the pleasure of paying you a visit. Your father, brothers, and sisters wish to be remembered to you. Clara is growing up the very image of you."

"Come in, come in," said Ilse; you yourself are the best greeting from home."

Mrs. Rollmaus stopped at the door.

"Only a moment," she said, pointing to the bandbox.

"You come to old friends."

"You must allow me however, that I may not disgrace this princely house."

Mrs. Rollmaus was taken into an adjoining room, the bandbox opened, and, after the best cap was put on, as well as white collar and cuffs, the learned lady floated into the sitting-room with Ilse.

"Magnificent," she exclaimed, looking with admiration at the ceiling, where the god of love held out to her his bunches of poppies. "One can see at once by the cross-bow that it is a Cupid; one frequently sees them on gingerbread figures, where they stand between two burning hearts. Dear Professor, the pleasure of meeting again, and in such surroundings, is truly very great. I have long looked forward with pleasure to this hour, when I could express to you my thanks for the last book you sent me, in which I have gotten as far as the Reformation. Rollmaus would gladly have come with me, but he has business to attend to in the distillery on account of the old boiler, which must be removed."

During this speech the eye of Mrs. Rollmaus wandered inquisitively into every corner of the room.

"Who would have thought, dear Ilse, that you and the Professor would have come into friendly relations with our princely personages? I must confess to you that I have already looked about me in driving here for the princely court-yard, which, however, probably lies on the other side, as I see only gardens here."

"There are no offices at the castle," explained Ilse, "only the stable and the large kitchen have remained."

"They say there are six cooks," rejoined Mrs. Rollmaus, "who are all great head-cooks; although I do not know for what other part of the human body they could be cooking. But the originalities of a Court are very great,—amongst which are the silver-cleaners, who, I verily believe, do not do their duty; at least,

the small coin in our country is very dirty, and a great scouring day would be necessary for them. They say that the young Prince has now gone to the Chief Forester's lodge. Our Chief Forester is fully occupied; he grumbles over this royal quartering, and has ordered himself a new uniform."

She became serious and thoughtful, and there ensued an awkward pause, during which she rubbed her nose, looked at Ilse good-humoredly, and pressed her hand.

"There appears to be a storm coming," she continued, in a low tone, "and the country gentlemen complain that the spring grub has eaten the rapeseed. Here, indeed, it seems like a paradise, although I hope that no wild beasts rove about here, and it is not the season to pluck the apples from the trees with pleasure. Something seems to have turned up in the capital which is very remarkable; for as I came to the estate with Rollmaus, the Inspector told me of a fortune-teller who prophesied wonderful things of the people of this city. Do you know anything certain about her?"

"We have few acquaintances," answered Ilse; "we only get news from the papers."

"I should be glad to hear something about that person, for I have latterly begun the study of phrenology; and I hear, dear Professor, that these investigations are much combated. I do not myself feel sure about them. I have examined the head of Rollmaus, and am surprised to see how much the bump of destruction is developed behind his ear, though he is annoyed at every cup-handle the maid servants break. Nevertheless, dear Professor, I find the powers of thought shown upon your brow. The bumps are very large, by which I do not mean to say that they are unbecoming to you. But to return to the fortune-teller. She told the Inspector that he was married, and had two children, and that his wife was dead, and that he wished to take another, who would add two more. This is all correct, for he is again courting. Now, I ask you, how could this person know it?"

"Perhaps she knows the Inspector?" replied the Professor, rummaging among his papers. "I advise you not to confide in her art, and I do not recommend to you the study of phrenology. But now let us know how long you can remain with us. I am obliged to go to the Museum, and hope to find you on my return."

"I can remain a few hours," said Mrs. Rollmaus. "I have three miles to go, but the roads here are better than with us. Although now our highway is being built, and the road commissioners already go along it to the town of Rossau. Only think, dear Ilse, the stone bridge between your estate and the town is already pulled down, but they have put up a temporary one in its stead. For a few hours, then, I beg of you to be satisfied with my company."

(To be continued.)

BOOK REVIEWS.

TIMES AND DAYS: BEING ESSAYS IN ROMANCE AND HISTORY.
London and New York: Longman's, Green, & Co. Chicago:
A. C. McClurg & Co.

This neat and dainty volume presents us with a collection of studies in life and character. Their form is that of designedly unfinished portraits; reflections, it appears, mainly suggested by incidents and experiences of the writer's life. Many—though we cannot say it of all—are rich in delicate fancies, witty conceits, and touches of consummate irony and sarcasm. We quote the following, entitled "Rivers," as representative:

"There is a quiet beauty in the upper reaches of the river. Here it is only a small musical stream. There it laughs over a little weir, or puts its white shoulder to the old wheel of a small flour mill. Here it slips through green bowers, peeped at through thick leaves by the high sun. Here it passes by smooth lawns which trail their fringes of willows in the water. Here a great market boat lolls along, lazily propelled by long sweeps, and bearing down garden products to the city.

"But see the stream after it has washed foully through the town. Water? It is ink, and bad at that. It has passed by high towering wharves crowned by warehouses, under stately bridges thunderous with traffic. It has reflected in its greasiness palaces and high-domed churches. And now it has come out of its burrow, the town, into the country again—a flat bare country. But how different it is now. Its banks are slime. It no longer laughs, but from its depths, when it is disturbed, patches rise, like leprous spots on its surface. Its quiet is all gone. Its surface is crowded with journeying craft. Here with a hayboat piled high. There with great silent-going screw-steamers moving grimly out of and in the busy port. Its sky is full of the trailing serpents which these leave. Here, too, trains of towed barges burden the tide. It is a great highway carrying fleets of commerce this way and that. It is no longer the pleasant stream that whispered comfort to the soul; this only suggests comfort to the pocket. And man's life, as has often been said, is not unlike such a stream. Pure in childhood, given to business in the haunts of men—and it issues therefrom smudged and befouled, and withal richly prosperous—but ugly, unwholesome, slimy, until it is lost in the great pure sea of death."

HIS BROKEN SWORD. *Winnie Louise Taylor.* Chicago: A. C. McClurg & Co.

The above is a novel combining a very beautiful and stirring love-story with a description of modern methods of criminal legislation and punishment. It is a book of unusual merit and interest throughout, written with an evident, but very noble purpose, a little "preachy" in its style now and then, but devoid of all cant and sentimentality, and a worthy contribution to modern fiction. Miss Taylor is a resident of Illinois, who for several years has devoted herself to a study of the problem of prison-reform. She locates the story, in which she illustrates her views on this subject in Wisconsin, a state far in advance of our own in its general system of pauper and criminal legislation. Thus she does not prejudice her critics in advance, with a picture of old-time methods and results. On the contrary her spirit seems most fair and just throughout. She brings a clear mind and warm heart, sound judgment and loving sympathy to the solution of her problem, and the result is given in the history of the strange but not impossible fortunes of Robert Allston. *His Broken Sword* is, like most novels of the day, without a plot; but the interest increases with every page, and this is a high compliment to pay to the writer's fitness for her task, and the worthy purpose which led her to its undertaking. The main motive of the work is not fully developed until near the middle of the book, which is thus relieved of a too severe didacticism of tone and intent. It dates back to the early sixties,

and the opening of the Civil War, and to the older reader revives many mingled sad and pleasant memories of that time. We purposely refrain from giving the outline of the story in the hope of more successfully arousing interest in a work which cannot but create a new enthusiasm for humanity in every one who reads it.

C. P. W.

The Humboldt Publishing Co., No. 24 East Fourth Street, New York, have issued in pamphlet form, an essay by William Nelson Black, *Ultimate Finance; a True Theory of Wealth*. It is the merit of this series of publications to have brought within the public reach, numerous works of scientific excellence, and the character of Mr. Black's treatise justifies the present selection. The first two chapters treat of the origin of property and the evolution of wealth, the third and fourth discuss the principles and possibilities of banking and insurance, and the fifth, sixth, and seventh are devoted to a correction of the many misconceptions that abound on the nature of accumulation, and the administration of property. The main purpose is an exposition of the theory of bonded insurance. Our readers will find it a clear and concise exposition of the principles of finance.

The Art Amateur for April has many good things, but we are a little staggered by the first sentence that meets our eyes in a notice of the Whistler Exhibition. "Every artist is of necessity an *abstractor of quintessence*." Surely Concord School never produced anything more delightfully abstract and absurd. The rest of the article is written in simple English but surely the art of writing should be respected by the amateur as well as those of painting and sculpture.

"The Atelier" is filled with good matter and good illustrations. The best method of work in pen and ink sketching is clearly described and very good examples are given from Liphart's works. A "rapid sketch of a passing object" by Vierge shows how such action may be given in the slightest work by one who knows how to seize the characteristic points and lines of his subject.

A very peculiar drawing by Bontet de Monvel has much the effect of a negative photograph or a Chinese embellishment of a fan—there is such a strong and unexpected contrast of large lights and black shadows in it. The Crayon drawings by Clausen, by Jean Aubert, and Leon Perrault, are all spirited and pleasing.

The season for flower painting is just approaching. Those who love the beauty of flowers as well as their scientific meaning—will find it a great pleasure in traveling in summer to be able to paint the rare flowers they find as well as to preserve them for the herbarium. A good representation in water colors may be made very quickly, even while the train is stopping at way stations, by one skilled in the art. *The Amateur* has many good suggestions for such work.

NOTES.

We have received great quantities of letters relative to the Henry George discussion. Our limited time has alone prevented us from considering them. We shall, however, select the best for publication.

In 1749, says *Life Lore*, in a charming little essay, Beguelin bethought himself of the Columbus joke and cut a window in a egg. Prof. Gerlach has now constructed, practically upon this idea, a contrivance styled the embryoscope. The professor's application of glazery to embryology has not been without success. It is "particularly instructive for those who are interested in the influence of outside upon inside to look through this window, to see how one chemical acts as a brake, and another as a stimulus, to observe how under pressure the chick does not lose heart but forms a double one; to notice how, disgusted with its uncovering, it sometimes neglects altogether to draw over it one of its orthodox birth-robes, which students call the amnion. Like a disturbed infant, it kicks off its clothes."

"The Week, one of the ablest papers on the continent."—*Descriptive America.*

ENLARGED AND IMPROVED.

"THE WEEK,"

A Canadian Journal of Politics, Literature, Science, and Art.

Published every Friday. \$3.00 per year.
 \$1.00 for Four Months.

THE WEEK has entered on its SIXTH year of publication, greatly enlarged and improved in every respect, rendering it still more worthy the cordial support of every one interested in the maintenance of a first class literary journal.

The independence in politics and criticism which has characterized THE WEEK ever since its first issue will be rigidly maintained; and unceasing efforts will be made to improve its literary character and increase its attractiveness as a journal for the cultured home. Many new and able writers are now, or have promised to become, contributors to its columns, and the constant aim of the Publisher will be to make THE WEEK fully equal to the best literary journals in Britain and the United States.

As heretofore, PROF. GOLDWIN SMITH will, from time to time, contribute articles. London, Paris, Washington, and Montreal letters from accomplished correspondents will appear at regular intervals. Special Ottawa Letters will appear during the sessions of Parliament.

THE WEEK in its enlarged form will be the same size as "Harper's Weekly," and the largest paper of its class on the continent.

Send for Free Sample Copy.

SENSIBLE LOW-COST HOUSES.—HOW TO BUILD THEM.

Our new ATLAS, entitled, "SENSIBLE LOW-COST HOUSES—HOW TO BUILD THEM," now ready. This contains plans, illustrations, and complete descriptions of 58 New, Beautiful, and Cheap Country Houses, costing from \$800 to \$7500. Shows how you can build a \$2000 house for \$1750, and how to make them handsome, convenient, healthy, light, cool, and airy in summer, and snugly heated in winter. Tells intending builders of homes what to do, and warns them what not to do. Describes houses adapted to all climates. NATIONAL ARCHITECTURAL UNION, 927 Chestnut Street, Philadelphia, Pa. \$1.00 by mail.

THE TEACHER'S OUTLOOK.

Published by The Teacher's Publishing Company, Des Moines, Iowa. A monthly magazine devoted to the interests of teachers and advanced pupils and intended to supplement the good work done by other school journals rather than to occupy the same field. Instead of filling its columns with school methods, school aids, and the details of school work, it will aim to interest the teachers in matters outside of the atmosphere of the school room, and its columns will furnish the teacher with upon affairs of life, facts in science and nature which illustrate and test the theories of the schools. In this work it will hope to furnish the teacher with a natural source of inspiration and mental energy, quicken thought and make the school room a place joyous with buoyant spirits that offer a responsive greeting to the inquiring minds of youth, rather than heavy with that gloom and dullness which often surrounds the daily toil.

A leading feature of the magazine will be a monthly review of current events, civil and industrial problems, scientific inventions, discoveries, etc.

Another feature will be a very complete Review of current Literature, especially of all books and magazines coming within the sphere of its labor. We have entered into arrangements with all the leading publishers to keep us informed of all their new and prospective publications, and the Reviews will be made by competent critics.

Still another feature, and a very important one as giving a practical value to the Outlook, offered will be the formation of a circle of writers out of its subscribers, from which it hopes to draw its corps of contributors. This plan is original as applied to a magazine, and is based on the idea of co-operation or mutual helpfulness. If met with that appreciation necessary to its full execution it will be the means of introducing many new writers to the public, and of aiding many who now lack the training in the expression of thought necessary to a kindly reception in the field of literature into which their tastes would lead them. For further particulars send four cents for Prospectus, or fifty cents for magazine eight months. 112

Scientific Pamphlets.

THE OPEN COURT is in receipt of a number of the latest re-publications of the

Naturwissenschaftliche Wochenschrift,

in pamphlet form, which will be sent postpaid to any address for the price marked.

Secular Thought

A Journal of Liberal Thought.

The Official Organ of the Canadian Secular Union.

\$2 a Year. Published Weekly. Single Copy, 5c.
 CHARLES WATTS, EDITOR.

31 Adelaide Street East, Toronto, Ont., Canada.
 Read what Colonel Ingersoll says:

"I am greatly pleased with 'Secular Thought'—with its form, arrangement, and contents—above all, with its spirit. It is splendid. I don't see how it could be better. I read it with the greatest of pleasure."
 Col. ROBT. G. INGERSOLL.

Read what Helen H. Gardner says:

"Permit me to congratulate you on the fine appearance and tone of 'Secular Thought.' I heartily congratulate our Canadian friends upon the fact that they are represented by a paper of which they can be justly proud, and which they need never hesitate to hand to their most delicately-minded friends, however religious they may be."
 HELEN H. GARDNER.

"THE MICROSCOPE,"

FOR 1889.

The leading exponent of Microscopy in the United States.

The representative of what is best, most instructive, and progressive in American Microscopy.

An enterprising and liberal purveyor of Microscopical News selected from the most reliable scientific journals of Europe and America.

A reliable teacher for the beginner, and a medium through which advanced workers publish to the world the results of their labors.

Among the contributors to this journal are:

PROF. CHAS. E. BESSEY, University of Nebraska.

Prof. T. J. BURRILL, University of Illinois.

Prof. M. D. EWELL, Northwestern University.

Prof. J. WALTER FEWKES, Harvard University.

Prof. C. H. STOWELL, University of Michigan.

Prof. S. H. GAGE, Cornell University.

Prof. H. L. SMITH, Hobart College.

Dr. ALFRED C. STOKES.

Prof. JOHN A. BRASHEAR.

Prof. HENRY MILLS.

Dr. F. H. WHEPLEY.

Dr. F. L. JAMES.

E. H. GRIFFITH, Esq.

C. M. VORCE, Esq.

And many other well-known writers on microscopy.

Each number is replete with information valuable to educated Americans who desire to acquire a scientific knowledge in its broadest sense.

THE Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects

1. The Psychology of the Cell—Introductory.
2. The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.
3. The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition: Predatory Habits of Certain Animalcula.
4. Colonies of Unicellular Organisms.
5. Fecundation of Proto-Organisms.
6. Fecundation of Higher Animals and Plants.
7. The Physiological Function of the Nucleus.
8. Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instanced, apart from the author's original investigations, the researches of *Balbani, Claparède and Lachmann, Mowbray, Ribot, Hackett, Engelmann, Espinas, Pouchet, Weber, Pfeffer, Kent, Dujardin, Gruber, Nussbaum, Bälzschli, Lieberkühn.*

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Dr. G. J. Romanes, that the first appearance of the various psychical and intellectual faculties is assignable to different stages in the scale of zoological development.

16 mo, 135 pages. Cloth, 75 Cts, Paper, 50 Cts.

PSYCHOLOGY AND PHILOSOPHY.

SENSATION AND THE OUTER WORLD...A. BINET...No. 83.

IDEALISM AND REALISM. EDITOR.....No. 84.

DREAMS, SLEEP AND CONSCIOUSNESS.

M. Binet, after having animadverted upon the impropriety of excluding metaphysical questions from the domain of science, proceeds in the above-mentioned essay to discuss the interesting question of the relation between human sensation and its normal excitant, the external world. No resemblance is predicable, maintains M. Binet, between the perceptions of consciousness and the bodies that exist beyond us. Doctrines enunciating such resemblance, the author declares fallacious, and terms them "crude and naïve realisms." This fallacy, however, is widely prevalent in science. Physicists and philosophers still hold that the definitive explanation of natural phenomena is a mechanical explanation, wherein the concepts of mass and force are the ultimate and fundamental data. They fail to recognize, in this, the purely subjective character of sensations. They translate, merely, sensations of one kind into sensations of another kind, which seem to us more precise; thus, they explain the phenomenon of sound by the phenomenon of a vibration; merely substituting, thereby, a visual sensation for an auditory sensation. This leads the author to discuss the supreme importance of the visual sense in the investigation of phenomena; and the possibility of a purely auricular science is held forth; the author shows that the ear, by noting the *qualities* of sound, can solve *numerical* problems. Thus, the progression of human knowledge is accompanied by a progression of human capabilities. The future will transform our sciences; it may transform our senses.

Sensation and the phenomena of the external world, it is granted, *are* different. But does it follow that knowledge of external objects is therefore impossible? The electrical phenomenon traversing the wire of a telephone bears no resemblance to the spoken words thrown against the mouth-piece in the shape of air-waves; no more so than does sensation the external object. Yet is communication by means of a telephone impossible? *Are* not the spoken words reproduced at the other end of the line in substantially the form in which they were received? *Preservation of form* is all that is necessary; and this is possible even where there is no superficial resemblance. It is a contradiction to demand that knowledge should be other than it is. Cognition does not, and *need* not, go beyond sensation.

In Numbers 82 and 83 two interesting letters appear, discussing questions raised by the articles of Dr. G. M. Gould upon Dreams, Sleep, and Consciousness—practical studies upon the psychology of consciousness.

ETHICS AND SCIENCE.

ETHICAL EVOLUTION. PROF. E. D. COPE.....No. 82.

The utilitarian theory of morals, says the distinguished author has found in the law of evolution a permanent substantiation. Yet does that doctrine embrace the *whole* truth, does it embody exclusively the law of human ethical progress? Ethical conduct, it is true, is an outgrowth of natural mental constitution; it differs among individuals, among families, among races; physical necessities, and conditions of environment direct it. But the knowledge of right is an intellectual faculty. Ethical life expresses, further, the highest development of humanity. Accordingly, moral conduct has *various* phrases of evolution: the rational as well as the natural, the individual as well as the social; to which corresponding motives of utility, egoism, and altruism belong. We find these motives interacting, each predominant in their respective spheres. The rational element has found its expression in generalization, in the formation by far seeing men of ethical codes; the affectional element, the element of Love, has found its expression in beneficent altruism, wherein the filial relation to God forms an abiding motive to action. The faculty of reason and the sentiment of love ensure ethical perfection.

PASSIONS AND MANIAS. FELIX L. OSWALD, M.D. Nos. 81, 84.

Interesting essays in moral physiology, abounding in citations from history and science in support of the positions taken.

NEWS ABOUT THE PLANETS AND THE MOON.....No. 80.

This constitutes a survey of the latest astronomical observations. It includes a brief account of the canals on the surface of Mars, with their various attendant phenomena; the rotation of Jupiter; the temperature of the moon; and the strange light-phenomena recently observed in the neighborhood of Saturn.

SOCIOLOGY AND ECONOMICS.

HENRY GEORGE AND LAND TAXATION. WHEELBARROW.....No. 73

CORRESPONDENCE UPON THE DOCTRINE OF HENRY GEORGE.....Nos. 79, 80, 82, 84.

The criticisms by Wheelbarrow, touching the doctrines of Henry George, have evoked much comment and discussion. The main bulk of the correspondence relative to this question, remains still unpublished; showing the wide-spread interest taken in the subject, and the undoubted popularity of Mr. George's theories. The main endeavor of our correspondents seems directed towards demonstrating Wheelbarrows ignorance and misunderstanding of the great economist's position. This Wheelbarrow seeks to refute in a letter in No. 82.

HISTORICAL AND CRITICAL.

THE DILEMMA OF DOUBLE ALLEGIANCE. GEN. M. M. TRUMBULL.....No. 81.

The article by Gen. Trumbull is opportune. Its tone and position is commendable. Amid the chauvinistic fanfare of demagogic statesmen and bellicose newspapers, evoked by petty irritations over Samoa coal-stations and bait for cod-fish, the thoughtful citizen of foreign birth must often feel the appalling meaning that the problem of double allegiance embodies. "What is the ethics of patriotism that must guide us in case of actual war?" "The duty of men embarrassed by the ties of double allegiance," says Gen. Trumbull, "is to stand bravely by the republic whatever comes, but they ought to unite their moral and political influence to promote the settlement of all international disputes by peaceful arbitration." The question has excited much comment from the press throughout the country.

MAKING BREAD DEAR.

AN ANSWER TO THE CRITICISM OF "A SYMPATHIZER"

BY WHEELBARROW.

In the last number of THE OPEN COURT I find a formidable criticism by a "Sympathizer" who reproves me as a "would be reformer," "paralyzing the efforts of those who would gladly aid the humbler members of society to attain a better hold on life."

At first I was disposed to regret my article "Making Bread Dear" if the tendency of it was to such a mischievous result; but on reflection I saw that it had worked the other way; and I felt rather proud that it had not been without a good effect on Sympathizer. It did not paralyze him. It aroused him. It moved him so strongly that he investigated the evils I denounced. He examined my accusations and answered them.

The first witness offered by Sympathizer for the defense is a farmer, who did not know of "any combination to make wheat or flour high." Sympathizer went to the wrong farmer. He should have gone to one of those grateful farmers who sent a memorial to the very forestaller I complained of, thanking him for raising the price of wheat by working a "corner" in which hundreds of men were "squeezed" into poverty, the prime article of life bewitched, and the hunger of the poor increased. I assert that any agency is immoral which obstructs the natural ebb and flow of the tide running up and down between the producer and the consumer, that healthy, navigable stream which is called "supply and demand." It is an immoral agency that by conspiracy or cunning raises the price of bread to the hod-carrier, or lowers the price of wheat to the farmer.

It is a mistake that the farmer's pay is only 82 cents per day. Statistics may say that, but they cannot prove it because it is not true. Sympathizer's friend, I suppose, meant a net income of 82 cents a day over and above all expenses. It must also be a mistake that farmers are moving into the city to compete with shovelers. I have not yet seen any farmers who desire to trade ploughs for wheelbarrows. If the statement were true it would prove that agriculture had become the weak, attenuated base of American existence, and our social fabric would topple over, splitting itself to pieces in the fall like an iceberg in

the sea. I admit that the farmer is much poorer than he ought to be; I admit that he is the victim of numerous legalized extortions, but as he seems to enjoy them, and fears that they may be lifted from him, I will try to bear *his* poverty with resignation, although I have no patience with my own.

The next witness is a miller who testified as follows, "There is no combination among millers. On the contrary, if we get twenty-five cents per barrel for the use of our mill and the risk we take we are satisfied." The honesty of millers is proverbial, but I think this testimony will not stand the test of cross-examination. Did the witness mean that he made a barrel of flour for twenty-five cents, paying his workmen out of that, and also his taxes, and insurance?" Or did he mean that his profit was twenty-five cents a barrel? As to the "combination," I fear that Sympathizer's miller has not yet got the key to it. According to the journals published in the milling interest, negotiations have been for several months in progress looking to a combination of the big millers to freeze out the little ones, and abolish that "fierce competition." I have no doubt that the conspiracy will eventually succeed.

The next witness was a man who testified for the Board of Trade. He was not himself a member of the Board but he knew all about its machinery and methods. He was one of those exasperating witnesses who know too much, and hoodoo the side that calls them. It will be necessary now to bring on a real member of the Board to contradict or explain the testimony of Sympathizer's friend. His evidence verified my complaint, and showed that the price of bread *can* be artificially raised by "operations" on the Board of Trade. Nothing can be more cold-hearted and selfish than the following testimony: "The speculator operates to make *money*. He buys hoping for a *rise*, or he sells for future delivery hoping for a *decline*." Let Sympathizer read that sentence carefully and he will see that it springs from the ethics of the "pit" where conscience is drugged and stupefied. Let him bear in mind that the "speculator" spoken of "operates" on the bread of the poor; I say the bread of the poor because bread is literally the staff of life to the working man, while it is a trifling element in the rich man's bill of fare.

What is it that the speculator buys "hoping for a

rise? Wheat! Just think of a man wasting his religion in praying for a *rise* in the price of wheat! This, too, in a prayer sometimes three months long. 'Or to sell for future delivery hoping for a *decline*!' What a perverted moral instinct it must be that prompts a man to hope that the value of an article will diminish after he has sold it to his neighbor. Is it really true that no man can prosper unless at the expense of others?

The defense is as bad as the offense. Here is the explanation: The speculator sold at a stated price for future delivery that which he did not have, but which he must buy before the day agreed on to deliver it. For instance, on the first day of May, Peter sold Paul one hundred thousand bushels of wheat at one dollar per bushel to be delivered on the 30th day of June. Peter doesn't own a bushel of wheat but has two months in which to buy it. He spends the two months in praying that wheat may fall to seventy-five cents a bushel. His prayers are granted, and he buys the hundred thousand bushels of wheat for seventy-five thousand dollars. He delivers them to Paul and demands and receives from him a hundred thousand dollars for the wheat. He cares nothing for the fact that the wheat is not worth what he takes for it, nor for the further fact that the twenty-five thousand dollars won by Peter may be the measure of Paul's ruin.

Not only do the "operators" pray for those unnatural prices, but they also work for them, and effect them. Here is the confession of sympathizer's witness: "If the price is for the moment higher than any individual trader's opinion of the real price, he will offer for sale, and thus effect the price *downward*. If he thinks it too low, he will buy in the market, and thus influence the market *upward*. The opinions thus backed by monied risk, are much superior to the *ex parte* notion of Wheelbarrow, or any other person who merely stands off and looks on."

I do not see the superiority of those opinions to mine, for they are the very same opinions that I myself expressed. I complained that rich operators *could* affect the market, and effect the rise or fall of wheat by the aid of money. What is gambling but "opinions backed by monied risk?" That expression is a plagiarism from the invitation of the man who runs the wheel of fortune at the races. "Step forward, gentlemen, and back your own opinions."

Manufacturing or Commercial industry "backed by monied risk" is a very different thing to the speculation on the prices of things which the seller does not own and the buyer does not want; things which are not now and never will be in the possession of either party, and which perhaps are not yet in existence. This kind of speculation does not equalize the temperature of prices, and make a fair average one month with another between the producer and the consumer. In

a market subject to artificial derangement, the poor man must always pay for a speculative margin which the baker must keep on the price of bread to protect him from a possible rise in flour. Every man who handles the wheat from the time it leaves the farm until it is sold in the form of bread, is compelled to insure himself against a possible speculative inflation of its price, and the consumer pays the insurance.

The witness did not deny that "corners" were operated by rich men on the Board of Trade. He not only admitted it but gave examples of its vicious and gambling character. I submit my case on the testimony of Sympathizer's witness. The details of his testimony reveal commercial business in its most heartless form, where the measure of one man's gain is the measure of another man's loss. In reply to the apology that "their influence is so brief, they seldom affect the price of the product to the actual consumer," I offer the fact that the great "corner" of three months ago did actually raise the price of bread in the city of Chicago. The coal barons of New York who levied a tax on all consumers of coal, are well remembered still. Answer that, explain it, or excuse it if you can.

Sympathiser's witness tells us that "corners" are merely "episodes." He says: "They are like raids in the rear of an army or piratical excursions over ordinary peaceful seas." What further testimony is necessary to their amiable and benevolent character? Fancy Captain Kidd on trial for scuttling ships. Sympathiser's friend is called in as a witness to character. He testifies that he is well acquainted with the defendant, and that he is merely an inoffensive pirate; that he did not scuttle all the ships on the ocean "as he sailed, as he sailed," but only a few of them; and that his "influence was so brief as to not affect the price of the product to the actual consumer."

Suppose a gang of pirates should raid Lake Michigan for a few days, plunder ships, and destroy them, swoop down upon Chicago and carry off rich booty, would Synnathiser comfort the victims of the raid by the assurance that the influence of the pirates "is next to nil"?

Sympathizer says that I have no right to claim an interest in the increase of my country's wealth, nor, I suppose, in the expansion of its glory. He says that as a wheeler of earth I can do no more "in that line" than my predecessor did a thousand years ago. That is true, and I only ask wages in proportion to the rank of my wheelbarrow in the scale of productive activities.

The wealth of a country is the product of all its industrial forces working together. Let us suppose that of this product the wheelbarrow contributes one part, the jackplane two parts, the trowel three, the plough four, the yardstick five, and so on up to the

banker's ready reckoner, which we represent as ten. In twenty years the product of them all has doubled; shall the banker's share be twenty, the merchant's ten, the farmer's eight, the trowel's six, the jackplane's four, and the wheelbarrow's only one. I insist that in proportion to my rank in the scale of production I am entitled to my share of the increase. I am a stockholder in the Bank of Industry, and I am entitled to my dividends in proportion to the stock I hold. If I did not wheel earth somebody else would have to do it, perhaps the bricklayer, or the clerk, or the merchant, or the banker, for wheeling of earth must be done. When in the great lottery of life the duty of doing it, fell to me, I bore upon my shoulders men of greater skill to work at higher trades than mine. Without me to stand on, they must have worked upon a lower plane. I am willing that the man who contributes five talents to the capital stock shall receive another five over and above. I envy not the hundred per cent. reward to him who has contributed four, or three, or two talents, but I insist that my one talent, if I bury it not in the ground, but throw it into the common fund, shall be doubled in honor like the rest.

While other men grow up with the country what I stand still? As I cannot release myself from duty to my country, neither can any other man justly deprive me of my share in its greatness and its growth. You can no more justly deprive me of my share in the increase of national riches than of my share in the increase of national freedom, for which I fought in many battles. Have I no inheritance in the legacy of the past? Did the great inventors and discoverers leave me nothing when they died? As well tell me that Shakespere, Goethe, Plato, Newton, Bacon, left me nothing. I am heir of all the men whose genius has multiplied the moral and material riches of the world. Every other man is co-heir with me in the great inheritance, and every woman too.

Sympathizer kindly advises that if my Wheelbarrow wages is too low, I turn my attention to the Bar, the Pulpit, or the Press. This is like the physician who advertised advice gratis to the poor, and when they came for it, recommended them to try the climate and the waters of Baden-Baden. Does Sympathizer know of any wealthy congregation in want of a preacher of my peculiar faith?

Let it not be thought that my censures were aimed at the Board of Trade as a corporation, or at its members as a class. They were aimed at certain methods practiced by certain men within the privileges and opportunities of the Board, methods which are confessed and condemned by Sympathizer and his witnesses. Many of the most honorable, generous, and useful men in this community are members of the Board of Trade; men whose friendship any man may be proud to enjoy.

When I demand cheap bread, I do not wish to deprive the farmer, the miller, or the Board of Trade man, or anybody who contributes to its production and distribution, of his deserved reward. Everybody who does work for the benefit of society is employed in his own way to make bread cheap. Bread, it is true, under special conditions, with a given amount of labor and its machinery, cannot be cheaper than the legitimate wages of its producers. But its price is often increased by additional taxes levied upon it by industrial "pirates" that intervene between the legitimate distributors. Theirs is that making bread dear of which I spoke.

Let us unite against the common enemies of society. Every honest calling is productive of some good. It makes life easier and better. The honest business of the Board of Trade, as Sympathizer explains, is to equalize the price of wheat and facilitate its journey from the farm to the laborer in the city. That appears to me to be a useful work and I can see how it may tend toward "making bread cheap. From what I had heard of Sympathizer's article, I expected a complete refutation, but I think he strengthens my position. I see clearer than ever that "making bread dear" is a crime.

THE HISTORY OF THE VEDIC EPOCH.

BY PROF. H. OLDENBERG.

CONCERNING the Vedic poems, the question arises, what do we know of the history of India in the age which produced them? Where does the possibility here begin of fixing events chronologically? In that part of the province of history in which this precision is lacking, can any determinate lines of another sort be drawn?

Of a history of ancient India in the sense in which we speak of the history of Rome, or in the manner in which the history of the Israelitic nation is recounted in the Old Testament, the Vedas afford us no testimony. A succession of events clearly united with one another, the presence of energetic personalities, whose aspirations and achievements we can understand, momentous struggles for the institution and security of civil government—these are things of which nothing is told to us. We may add that there are things which seem to have existed in Ancient India less than in any other civilized nation. The more we know of the history of this people the more it appears like an incoherent mass of chance occurrences. These occurrences are wanting in that firm bearing and significant sense which the power of a willing and conscious national purpose imparts to its doings. Only in the history of thought, and especially of religious thought, do we tread, in India, upon solid ground. Of a history in any other sense we can here scarcely speak. And a peo-

ple who has no history, has of course no written historical works.

In those eras in which, among soundly organized nations, interest in the past and its connection with the struggles and sufferings of the present awakes, when the Herodotuses and Fabiuses, the narrators of that which has happened, are wont to arise, the literary activity of India was absorbed in theological and philosophical speculation. In all occurrences was seen but one aspect, namely, that they were transitory; and everything transitory was recognized, we may not say as a simile, yet as something absolutely worthless, an unfortunate nothing, from which the sage was bound to divert his thoughts.

We can thus easily see how fully we must renounce our hopes of an exact result, when the question is raised as to the time to which the little we know of the outer vicissitudes of the ancient Hindu tribes must be assigned, and, especially, as to the time in which the great literary remains of the Veda and the changes which it wrought in the Hindu world of thought belong. The basis that might serve toward definitely answering these questions of chronology—lists of kings with statements of the duration of each reign—is wholly wanting for the Vedic period. Of early times at least no such lists have been handed down to us; there are no traces indeed that such ever existed. The later catalogues, however, which have been fabricated in the shops of the Indian compilers, can today no more be taken into consideration as the basis of earnest research, than the statements of the Roman chroniclers as to how many years King Romulus and King Numa reigned. How unusual it was in the Vedic times for the Hindus to ask the "when" of events, is shown very clearly by the fact, that no expression was in current use by which any year but the present was distinguishable from any other year.

The result of this for us, and likewise, of course, for the science of Ancient India, is that those long centuries were and are practically synonymous with immeasurable time. The standard by which we are accustomed to compute the distance of historical antecedence in our thoughts or imaginations, fail us in this richly developed civilization as completely as in the prehistoric domains of the stone age, or in the first feeble glimmerings of human existence. In fact, as prehistoric research tries to compute the duration of the past ages which have given to the earth's surface its form, so as to determine approximately the age of the human remains embedded in the strata of the earth; so, in a similar way, the investigation of the Hindu poetry, in its attempts to compute the age of the Veda, has sought refuge in the gradual changes that have imperceptibly taken place in the course of

centuries, in that great time-measurer, the starry heavens.

There was found in a work, classed as one of the Vedas, an astronomical statement which has served as a basis for such computations. The result attained was that this particular poem dated from the year 1181 B. C. (according to another reckoning 1391 B. C.). Unfortunately, the belief that in this way certain data are to be acquired had to vanish quickly enough. It was soon found out that the Vedic statement is not sufficient to afford any tenable basis for astronomical computations. Thus it remains that for the times of the Vedas there is no fixed chronological date. And to any one who knows of what things the Hindu authors were wont to speak, and of what not, it will be tolerably certain, that even the richest and most unexpected discoveries of new texts, though they may vastly extend our knowledge in other respects, will in this respect make no changes whatever.

There are two great events in the history of India with which this darkness begins to be dispelled—the one approximately, and the other accurately, referable to an ascertainable point of time. These are the advent of Buddha and the contact of the Hindus with the Greeks under Alexander the Great and his successors.

That it was the old Buddhistic communities in India that first began the work of gathering up the connected traditions within historical memory, seems certain. At least this corresponds with the apparent and accepted course of events. To Vedic and Brahmanical philosophy all earthly fortunes were absolutely worthless—a vanity of vanities; and over against them stood the significant stillness of the Eternal, undisturbed by any change. But for the followers of Buddha, there was a point at which this Eternal entered the world of temporal things, and thus there was for them a piece of history which maintained its place beside or rather directly within their religious teachings. This was the history of the advent of Buddha and the life of the communities founded by him.

There is a firm recollection of the assemblies in which the most honored and learned leaders of the communities, and great bands of monks coming together from far and wide, determined weighty points of doctrine and ritual. The kings under whom these councils were held are named, and the predecessors of these kings are mentioned even as far back as the pious King Bimbisara, the contemporary and zealous protector of Buddha. Of the series of kings which in this way have been fixed by the chronicles of the Buddhistic order, two figures are especially prominent—*Tschandragupta* (i. e., the one pro-

ted by the Moon) and his grandson *Asoka* (the Painless). *Tschandragupta* is a personality well known to Greek and Roman historians. They call him *Sandrokypptos*, and relate that after the death of Alexander the Great (in the year 323 B. C.), he successfully opposed the power of the Greeks on their invasion into India, and lifted himself from a humble position to that of ruler of a wide kingdom. *Asoka*, on the other hand, is not mentioned by the Greeks; but in one of his inscriptions—by him were made the oldest inscriptions discovered in India, and these have been found on walls and pillars in the most distant parts of the peninsula—he himself speaks of Antijoka, king of the Iona (Ionians, *i. e.*, Greeks), Antikina, Alikasandara, and other Greek monarchs.*

Here at last a place is reached where the historical investigator of India reaches firm ground. Events whose years and centuries—as though they occurred on another planet—are not commensurable with those of the earth, meet at this point with spheres of events which we know and are able to measure. If we reckon back from the fixed dates of *Tschandragupta* and *Asoka* to *Buddha*—and we have no grounds for regarding the statements of time which we find respecting Buddhistic chronology as not at least approximately correct—we find the year of the great teacher's death to be about 480 B. C. His work therefore falls in the time at which the Greeks fought their battles for freedom from Persian rule, and the fundamental lines of a republican constitution were drawn in Rome.

Buddha's life, however, marks the extreme limit at which we may find even approximate dates. Beyond this, through the long centuries which must have elapsed from the beginning of the Rig Veda epoch to that of *Buddha*, the question still remains: What was the succession of events—the few events of which we may speak? What the order in which the great strata of literary remains were formed? We observe the relation which one text bears to the others which appear to have previously existed; we follow the gradual changes which the language has suffered, the blotting out of old words and forms and the appearance of new ones; we count the long and short syllables of the verses so as to learn the imperceptible but strictly regular course by which their rhythms have been freed from old laws of construction and subjected to new forms; moving in a parallel direction with these linguistic and metrical changes we note the changes of external ideas, and of the contents as well as the external forms of intellectual and spiritual life. Thus we

learn in the chaos of this literature ever more surely to distinguish the old from the new, and understand the course of development which has run through both.

Many a path, it is true, in which research hoped to press forward, has been shown to be delusive and worthless; problems have had to be given up, changed, and presented in different forms. But in its last results the work has not been in vain. For, in respect to the Veda in particular, and the antiquities of India in general, we have learned to recognize the principal directions in which the tendencies of historical growth are to be traced.

From the second century of Hindu research we can scarcely expect discoveries similar to those which the first has brought: such a sudden uprising of unusual, broad, fruitful fields of historical knowledge. But we may still hope that the future of our science will bring results of another sort no less rich—the explanation of hitherto inexplicable phenomena, the transformation of that which is half known into that which is fully known.

NO CREED BUT FAITH.

By creed we understand a summary of the articles of religious belief, and by faith a trustful confidence in something or some one that we are convinced is good and true. Creed is dogmatic; faith is moral. The creeds of the world are contained in the many Credos, in the doctrines of the different religions; faith is enshrined in human hearts. Creeds are dead letters; faith is the quickening spirit.

The religious problem of to-day will find its simple solution in the sentence: No creed, but faith. Let us have faith in the moral order of the world, the faith of a grain of mustard seed, and without swerving live and grow accordingly. Let us have faith in our ideals of Truth and Beauty and Goodness. If we have no faith, how can our ideals be realized? How can the tree grow if the seed be dead?

Faith in Hebrew is *amunah*, which means firmness. No credulity is wanted, but steadiness of character. Faith in Greek is *πίστις*, which is etymologically the same word as the Latin *fides* and the English *faith*. The verb *πιστεύειν* does not signify to believe, but to trust. So long and in so far as Christianity was a living faith, it was truly human and progressive. But as soon as priestcraft prevailed and identified creed with faith, the religious spirit lost its life; it became a reactionary power, for it was fossilized into the letter that killeth; and instead of faith credulity was enthroned as the basic virtue of a religious life. Not truth ascertainable and verifiable by scientific investigation was accepted as the basis of religion, but certain unverified and even absurd doctrines, which were established as self-evident axioms. Science was pooh-poohed like

* Antijoka is Antiochus Theos; Antikina, Antigonos Gonatos; Alikasandara, of course, not Alexander the Great, but Alexander of Epirus, son of Pyrrhus, the enemy of the Romans. All these princes reigned about the middle of the third century B. C. Of Alexander the Great in India no traces have been found, with the exception of a coin which bears his picture and his name.

Cinderella as worldly and ungodly, whereas by rights it should hold the torch to faith lest it walk in the path of superstition or other errors.

Three days after the crusaders had taken Antioch (June 3, 1098), Kerbogha, the Emir of Mosul, arrived with an army which was in almost every respect, and especially in numbers, superior to the Christians. He invested the city and cut off all supplies. Famine and sickness caused great havoc, and many goodly knights, among them even prominent leaders, such as Count Stephen of Blois, deserted in great despair. The whole army seemed to be doomed to die by the sword of the Moslem or to be starved. In this plight Peter Bartholomew, a Provençal of low birth, came to Count Raymond and declared that St. Andrew had shown him the holy lance that had pierced the side of Christ, and that it lay buried in St. Peter's Church of Antioch. The search began at once; twelve men dug a whole day, and in the evening a lance was really found not far from the altar. The lance being found, the crusaders began to have confidence again. Under the command of the circumspect and brave Boemund, they went out to do battle. Although worn out by fatigue and famine, they were confident that the holy lance would lead them to victory, and full of enthusiasm they beat the Emir so that his great army was soon scattered to the winds.

The story of the holy lance, it was soon discovered by the more sober Normans, was an imposture, but among the sanguine-minded Provençals the belief in it had worked wonders of prowess and made the apparently impossible an actual fact.

There may be a living faith concealed in a foolish superstition. It is not the error, not the superstition that works wonders, but the faith that lives in it. No victory, no virtue, no strength, without at least a grain of faith, be it ever so much mixed with false notions. False notions are a disastrous ingredient in faith, and unless in time discarded, they will and must lead into danger. For weak souls, an alloy of truth and error may serve as a substitute for pure truth; but it is truth alone that can make us strong and free.

Creed rarely can stand criticism, but faith can not only endure and survive criticism, it should even invite it. Criticism may destroy all creeds, but it will never destroy faith, and if it could, it would take out of life that which alone gives value to it. It would take away our ideals, our hopes, our aspirations, and the purpose of life. Life would be empty and meaningless.

Christ said :

"Verily I say unto you: If you have faith as a grain of mustard seed, you shall say unto this mountain, Remove hence to yonder place and it shall remove; and nothing shall be impossible unto you."

The instance of the crusaders' victory over Kerbogha is an example of how powerful faith can be, even though closely interwoven with superstition. It was not the superstition, however, that gave strength to the crusaders, but the moral faculty of confidence closely connected in this case with superstition. Great minds can exercise the same self-control and perform the same deeds, even greater deeds, without the assistance of superstition. It can be said of weak minds only, that superstition serves as a support to faith. It is true, that if well directed, it can give to a child the self-confident strength of a man. But woe unto us if we mistake superstition as genuine faith.

Our faith must not be blind, but rational; it must be based on exact knowledge, and it is our duty to purify it by critique and to harmonize it with science.

The reconciliation of moral ideals to knowledge, of religious faith to science is not of to-day nor of yesterday. Ever since humanity has aspired to progress and to increase in wisdom as well as in power, there has been a constant readjustment of the relation of these two factors. The prophet Hosea says :

"Hear the word of the Lord, ye children of Israel: * * * My people are destroyed for lack of knowledge. Because thou hast rejected knowledge, I will also reject thee."

It is lack of knowledge, or as we would now say, of science, that threatens to be destructive. If our clergy do not cease to preach creed, if they oppose science because it is in conflict with their creed, they will no longer remain priests of the Almighty, *i. e.*, of the moral power that leads humanity onward on the path of progress. They will deteriorate into a caste of time-servers and hypocrites, for they are lacking in the faith of the grain of mustard seed, which is the power of growth and progress.

Superstitions have under exceptional conditions, in the days of man's childhood, served as substitutes for faith; but we should learn that they are not the living faith itself nor do they add to the strength of faith. They rather detract from its vigor, its purity, and its nobility. Superstitions and the lack of knowledge will ultimately lead to perdition. On the other hand we should learn that our faith, our confidence in the truth of moral ideals, is by no means subverted if the superstitions incidentally connected therewith are recognized as illusions. Science of late has done away with many errors which had grown dear to us, but it has not and never will do away with our ideals of Truth, Beauty, and Goodness. It has rather taught us the laws according to which they can more and more be realized. Ideals evolve and change and, upon the whole, they progress and are improved.

If the grain rots in the earth we no longer fear that it is lost. We now know that the transformation is no sign of decay but of growth and as the husks of our

superstitious notions are breaking, a new faith bursts forth which will be wider and broader, purer and greater than all the old creeds with their narrow sectarian convictions. Dogmas will be forgotten, but Religion will remain. All the creeds will die away, but Faith will live forever.

P. C.

THE FRIAR.

BY * * *

A friar, still in youth,
Enters the abbot's cell ;
He modestly begins
His misery to tell,
In hope confession may
The pain of heart dispel :
" In spite of all my prayer
With me no peace doth dwell."

The old man kindly looks
In his repentant face,
And says, " Thou must believe
In God and in His grace!"
" O father, that I could
These doubts of mine efface,
And simple as a child
The hope of Christ embrace.

My conscience never can
Find from my sin release.
The more I ponder them,
The more my doubts increase.
Oh, to believe in God!
Oh, that this pain would cease.
I fear, there is no truth,
There is in life no peace!"

Old volumes in that cell
On shelves were placed around.
The authors of them had
In past times tried to sound
The very depth of truth,
And found it too profound.
Now, through the books, methinks,
Compassion did respond.

The abbot wistfully
Gazed at him in his pain.
A silence long and sad
Did all his heart explain ;
But in his thoughtful eyes
Was writ this doleful strain :
" Thou look'st for peace and truth
In this, our world, in vain."

SONNET.

BY LOUIS BELROSE, JR.

SAD is the flower, O Sun, that decks the way
Too soon ; while yet the wind of winter blows,
And blissful are the blossoms that unclose
Their tender petals to the warmth of May.

Sad is the soul, O Truth, that sees thy ray
Too soon ; and blest, ah, doubly blest are those
Who linger dreaming till their sweet repose
Is broken by the warmer beam of day.

Now joyous nature holds the vernal rite
And worships thee beneath the cloudless sky,
O Sun, from whom is life and all delight :

Yet one that loves thy bounty breathes a sigh :—
Ah, wherefore whisper, seeing all so bright,
O Truth, that e'en by this the Sun shall die ?

TO JOHN BRIGHT.

BY LOUIS BELROSE, JR.

WELL named, for all his valliant life was bright
With noble deeds. He rent the cloud that hung
Heavy on England. Words upon his tongue
Took wings of fire that made the darkness light.

His love was large. In days that worship might
He stood for justice, and with justice wrung
The prey from might itself. He died too young
To lose the faith that leans upon the right.

When England laughed to see the blood we let,
And hoped our nation dead, he held alone
For union. Brothers all, must we forget ?

Though waning senates groveled at the throne
Of vile expedience, the world knew yet
One statesman that durst call his soul his own.

CORRESPONDENCE.

THROW OPEN NATURAL OPPORTUNITIES.

To the Editor of THE OPEN COURT:—

NO DOUBT THE OPEN COURT has received a surfeit of letters defending or explaining the " Henry George doctrine," but I desire to notice a phase of the question which has not received the attention it deserves, *viz.*, " That poverty is the result of man's inherent vices."

" In man's obedience to moral laws (?) he finds the *only* magic wherewith to change the face of society."

This Calvinistic doctrine clashes with my sense of justice. As I apprehend Wheelbarrow's " morality," it is a compound of foresight, economy, thrift, and industry.

If prosperity is the result of superior moral qualities, then the morality of Jay Gould must be far greater than that of Wheelbarrow, and before Wheelbarrow presumes to teach morality, he must prove—by showing his vast possessions—that he himself is moral. Jay Gould, not Wheelbarrow, ought to teach morality; for is not his wealth the result of foresight, economy, thrift, and industry? Does this then not prove that he possesses in large degree, morality? To answer in the negative at once overthrows Wheelbarrow's philosophy, for then it is readily perceived that prosperity, and its attendant possibilities, is not necessarily the result of moral virtue.

" Ah, but we should be contented with our conditions, simply striving to do right."

No sir, contentment is ignorance; is conservatism; a progress-blighting philosophy. Who dares preach contentment to the father of a starving child? Tell poverty to be shrewd, to gamble upon what the *morrow* will bring forth? Advise it to be economical when its pressing necessities demand consumption? To be thrifty when it is bending every energy to relieve the hunger of yesterday? To be industrious when work at any price is looked upon as a boon?

We cannot teach morality, and I mean *morality*, to dead men; as a first condition they *must* be alive, and the less energy there is devoted to the struggle for mere existence, the more can be expended in developing moral character.

The spirit of the Henry George doctrine is expressed in the

following excerpt from THE OPEN COURT, page 1479: "So far as our knowledge reaches, thus far do we intellectually own nature, and can hope to rule its course in the interest of humanity by accommodating ourselves and natural events to nature's unalterable laws."

We aim at this, that is all, and as a primary and yet vital step in that direction, we seek to open up natural opportunities, confident that if we start right we are sure to follow up the advantage. Will not Wheelbarrow drop his pre-conceived ideas or theories long enough to study what it is we aim at, and then join us in this great struggle for the rights of man?

Fraternally yours,

NEW YORK CITY.

BENJ. DOBLIN.

NATURAL OPPORTUNITIES AND TOM'S BOOT.*

To the Editor of THE OPEN COURT:—

"I THINK there be six Richmonds in the field." I have answered five, and now comes Mr. Doblin with new arguments. He charges at an effigy of me made out of his own head, as the school-boy made the ship. I merely call upon him to direct his lance at me, and not at my "Counterfeit presentment." Mr. Doblin makes phrases, puts them into quotation marks, and then refutes their argument. This in itself is innocent enough, but people who do not understand it may infer from the quotation marks that the phrases and their sentiments are mine.

I never said "morality is a compound of foresight, economy, thrift, and industry." These are useful ingredients of character, but they are chiefly duties to ourselves. They are in the moral code indeed, but its more important parts prescribe the duties which we owe to others, the higher obligations of "morality."

Mr. Doblin cuts, clips, shortens, plaits, and takes in fold after fold of the spiritual garment called "morality" until it is diminished to the stature of a man whom he calls Jay Gould. Then he insinuates that "Wheelbarrow" did the tailoring, and that the diminished robe exactly fits my pattern of morality. I may exclaim with Cassius in the play, "You wrong me every way, you wrong me Brutus;" you charge to me a superstructure which I never built, for contrasts and comparisons I never thought of.

Is it not presumptuous to sit in judgment on our fellow men, and tell the world that we are holier than they? Is it not self-righteous to contrast the vices of his 'Jay Gould' with the shining virtues of ourselves? Our moralizers would become insolvent if that "awful warning" should be called to his reward. He serves the purpose of a dummy block whereon reformers may display their neighbor's fault for public reprobation. When they have it fitted on the image to the worst advantage they advertise it and exclaim, "Here is a choice article of social wickedness; see how it fits this dummy." Not one of them will try it on himself and say, "Behold, how closely it fits me." So handy is that Wall Street curiosity to "point a moral, and adorn a tale," that I sometimes think the odium cast upon him springs from envy at his vices and his luck. I fear to weigh my own righteousness against the sins of any man, lest when I gaze into my looking glass I see reflected there the features of that man.

The ironical sentiment about contentment is put within quotation marks as if it came from me. I am innocent of it; but it furnishes a text for high grade moral reprobation, which I heartily approve. All I ask is that the indignant "No Sir!" be addressed to the guilty person, and not to me. I am on record against contentment, if by that is meant the end of aspiration for myself, or the end of work for others. Neither have I ever told poverty to gamble upon what the *tomorrow* will bring forth. The odds against poverty are too great.

If I ever advised poverty to be thrifty in order to "relieve the

hunger of yesterday," I did a foolish thing. I think I am innocent of that also, although I plead guilty of advising thrift against the hunger of to-morrow. I never grieved over the "hunger of yesterday" but once, and that was when I was a little boy. I was asked if I would have a bit of meat pie; I said "No," when I meant "Yes," and was taken at my word. Next day I was tortured by the vision of that lost meat pie. Towards night it occurred to me that it was useless to weep over the hunger of yesterday and I have never done so since. It is the hunger of to-day that worries me.

I fully agree with Mr. Doblin that we cannot teach morality to dead men. I think with him that as a "first condition" of success in teaching, the pupils "must be alive."

As to the "spirit of the Henry George doctrine" I have no quarrel with it; "the letter killeth." It is not Mr. George's motives, but his measures that I question. I am as anxious as he is to "open up the natural opportunities," although I think the phrase is vague, uncertain, and misleading. We differ as to the means by which to "open up." Tom Kennedy and I were shovellers in the same gang. We were working on a bit of railroad not far from Chambly in Canada, and lodged in the house of a little Frenchman there. Tom was an Irishman, who reached conclusions by the most illogical means. One night he woke up complaining of the closeness of the room. "We must have some fresh air," he said, "I'll open up the windy." Instead of doing so in a Christian manner, he picked up one of my boots and flung it through the glass into the street, where I found it in the morning. Tom's conclusions were all right, but his way of reaching them was defective. Fresh air was a "natural opportunity" to which he was entitled, but he had no right to obtain it by throwing another man's boot through a third man's window. Neither has Mr. George nor Mr. Doblin.

If I should ask Mr. Doblin to "drop his pre-conceived ideas" in favor of Mr. George's theory, long enough to study my objections to it, he would rightly consider my demand unreasonable. It is not necessary to the candid study of any subject that a man should drop his pre-conceived ideas concerning it; yet Mr. Doblin, with complacent self-esteem, demands that I drop my pre-conceived ideas of his particular faith before I study it. This is a concession which no disputant has a right to ask of his antagonist. A man who denied the efficacy of prayer was requested by the preacher to give the matter "prayerful consideration."

My pre-conceived ideas of taxation leaned very much toward the scheme of Henry George. I am dropping some of them because the study of the question leads me to doubt their wisdom and their justice. For instance in the case of Thomas Clark, the farmer whom I spoke of lately. I think that society has no right to confiscate his farm because some other man holds land for speculative purposes. To tax it away from him by Mr. George's plan is to confiscate it.

"The Rights of Man." What man? What are the rights of Thomas Clark to the farm which he has literally planted in the wilderness? To tax the value of that farm to its full amount, the whole of which value has been made by the hard labor of Clark, would be a wrong for which the only excuse would be a plea of political insanity.

NOTES.

We have received an interesting lecture by W. Lymington Brown, M. D., upon *Benjamin Franklin*. It is an instructive sketch of the life of our great countryman, full of many salutary lessons.

Charles Eliot Norton, of Harvard, will contribute to *Scribner's* for May, a paper upon "The Lack of Old Homes in America," and the associations and sentiments of which we are thereby deprived.

* When I wrote this I had not yet seen the letter of Rev. Hugh O. Pentecost in No. 85 of THE OPEN COURT.

We read with great pleasure and satisfaction the articles by Pericles, in *The Independent Pulpit*.

We have received a number of *Tracts for Christians* from Mr. R. Randolph, of Philadelphia, the author of "Aspects of Humanity." Among them also a little brochure entitled "Stages of Faith, or Traces of Divine Mediation in Human Intelligence."

Miss Mary Morgan (Gowan Lea) will contribute to THE OPEN COURT a series of translations from Goethe, Rinkert, Chamisso, Platen, Eichendorf, Ernst Schultze, Hoffmann von Hattersleben and Paul Fleming, under the title "Gems from the German."

A new magazine for teachers, outside of the usual line of school journals, will be commenced May 1, 1889. It will endeavor to interest teachers and older pupils in the work of the scientific and literary world, and present an "outlook" upon current events, etc. It will be called the *Teacher's Outlook*, and published by the Teachers' Publishing Co., Des Moines, Iowa.

In a pamphlet styled *Unitarians as Congregationalists*, Mr. J. H. Crooker, of Madison, Wis., after sketching the rise and extension of Unitarian doctrines, refers to "the issue in the West." "The only way out of our so-called Western difficulties," says Mr. Crooker, "is in loyalty to Congregational Polity. . . . Western Unitarianism must be left free to grow and to define itself by the work of its several churches."

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXIV.—Continued.

The Professor went away; the ladies talked confidentially over the family at home, during which Mrs. Rollmaus could not entirely give up her scientific investigations; for, in the middle of the conversation, she put her fingers on Ilse's temples, and begged permission to feel the crown of her head; whereupon she said, with much delight, "There is much sincerity there, as I should have supposed." She then looked significantly at Ilse. She was loquacious and flippant, but she showed a degree of restraint which Ilse attributed to the strangeness of the place.

After Mrs. Rollmaus had admired the dwelling, criticized the pictures, and felt the texture of the furniture coverings, Ilse pointed to the sun, which was breaking through the clouds, and proposed that they should walk out into the park. Mrs. Rollmaus assented with pleasure, and Ilse had much to do to answer the questions of the excitable lady. Then they came to a part of the grounds which served as a promenade at this hour for the ladies and people of the city. "What a surprise," exclaimed Mrs. Rollmaus, suddenly seizing Ilse's arm, "the princely livery." At a turn in the path, the hat of a lackey became visible; the Princess, accompanied by Lady Gottlinde and Prince Victor, came directly towards them. Amidst the respectful greetings of the promenaders, the princely party approached. Ilse stepped aside, and curtsied. The Princess stopped. "We were on the point of calling on you," she began, kindly;

"my brother was obliged to leave suddenly; he will have told your father how sorry he was that he could not take any messages from you to your family." She gave a passing look at Mrs. Rollmaus, who was supporting herself with both her hands on her umbrella, bending her head forward, not to lose a syllable that fell from the lips of the princely lady. Ilse mentioned her name.

"A kind friend from the neighborhood of Rossau, who is spending a few days near here."

Mrs. Rollmaus ducked down very low, and, almost unconscious from terror, said: "It is only three miles from here, in Toadville; although, if I may, by your Highness's permission, be graciously allowed to say so, there are no more toads there than in any other respectable place."

"You are taking a walk," said the Princess, to Ilse, "will you accompany me a little way?" She beckoned Ilse to her side, placing herself between her and the lady in waiting. Prince Victor remained behind with Mrs. Rollmaus.

"So toads are not pastured on your estate?" began the Prince.

"No, my gracious —," replied Mrs. Rollmaus, embarrassed, supporting herself on her umbrella. "I do not really know what is the right title to address you with."

"Prince Victor," replied the young gentleman, carelessly.

"I beg your pardon; but this honorable name does not satisfy me. May I beg to know the other title, similar to what, in the case of pastors, would be expressed by Very Reverend? For to offend princely persons would not be pleasant, and I am not conversant with these forms of address."

"High and honorable lady, you may call me Highness; thus we shall both have our rights."

"It shall be as you command," exclaimed Mrs. Rollmaus, delighted.

"You have long known the Professor's wife?"

"From her childhood," explained Mrs. Rollmaus; "I was a friend of her deceased mother, and I can truly say that I have shared both happiness and sorrow with our dear Ilse. Prince Victor, it is impossible for your Highness to know her true heart as well as we do. Latterly, through her learned acquaintances, she has come into another atmosphere; but long before her betrothal it was clear to me that it would be a match."

"Good," said the Prince. "How long do you remain in the neighborhood?"

"Only until the end of the week; for Rollmaus prefers the country to the city, which is not to be wondered at; he has not the inclination for intellectual pursuits by which I am inspired. For this there is

* Translation copyrighted.

more opportunity in the city, although one, even in the country, can make one's observations on heads and other natural objects."

"The weather is changeable; is your carriage closed?" interrupted the Prince.

"It is a britscka, with a leather top to it," replied Mrs. Rollmaus. "I must honestly avow to you that it has been quite an unexpected pleasure to me that this visit has afforded the opportunity of seeing your Highness, for I have heard very much of you."

"I should be very grateful to you," replied the Prince, "if you would kindly tell me what you have heard. I have hitherto believed that my reputation was not by any means so bad as it might be."

"No one, however noble he may be, can escape calumny," exclaimed Mrs. Rollmaus, eagerly; "they talk of tricks. I fear your Highness will take it amiss if I mention this gossip."

"Tell me something of it," replied the Prince, "whatever it may be."

"They maintain that your Highness is convivial and lives quite boisterously, and other things which it would be unpleasant for me to repeat."

"Go on," said the Prince, cheerfully.

"That your Highness makes fools of other people."

"That is grievous," replied the Prince. "Is your coachman a courageous man?"

"He is somewhat surly even with Rollmaus, who indulges him much."

"Believe me Mrs. Rollmaus," continued the Prince, "it is a sorrowful business to be a prince. Disquiet from morning to evening. Every one will have something, and no one brings anything except bills. Thus all gaiety is sacrificed, one becomes sad, and slinks about through the bushes. My favorite recreation is a little quiet conversation in the evening with my old nurse and instructress, the widowed Cliquot, and to play a little 'patience.' Then one counts the good works that one has done during the day, sighs that they are so few, and looks for one's boot-jack. We are the victims of our position. If there is anything I envy the Professor's wife, it is her servant Gabriel, a trustworthy man, whom I recommend to your favorable attention."

"I know him," replied Mrs. Rollmaus; "I must acknowledge that the autobiography which you have given me agrees with all that I have discovered from the structure of your Highness's head, so far as your hat does not deprive one of the sight of it, which indeed is very much the case."

"I would be thankful to my cranium," muttered the Prince, "if it would lead everyone to believe my words as easily as you do."

"As long as I live, it will be a pleasure as well as a souvenir to me," continued Mrs. Rollmaus, with an

ambulatory curtsy, "to have been brought by accident to this intimate intercourse with your Highness, the remembrance of which I will, if I may be allowed to say so, recall to myself by your Highness's picture, which I hope may be had in the shops. I shall place myself before it when I am in the singular number, as now my son Karl does with his grammar, and think of past hours."

Prince Victor gave Mrs. Rollmaus a look of friendly benevolence.

"I will never allow you to buy my portrait. I beg permission to send you a copy as a remembrance. It is, unfortunately, not so true as I could wish. The painter has made me too large, and I am not quite content with the costume: it looks like a clergyman's gown. Meanwhile I beg you kindly to imagine it without this superfluity. Has the Chief Inspector Rollmaus good horses? Does he raise them himself?"

"Always, your Highness, he is famed for it among the neighbors."

The Prince turned with fresh interest towards the little lady.

"Perhaps one could transact some business with him. I am looking out for some strong saddle-horses. What kind of a man is he to deal with?" he asked, frankly.

"He is a very sharp tradesman," replied Mrs. Rollmaus, hesitatingly, and looking at the Prince with secret pity. "He is considered by his acquaintances as an expert in horses, and—and, if I may say so—is rather knowing."

The Prince pursed up his lips, bringing out a sound almost like a suppressed whistle.

"Then he is very unlike the highly honored lady, and I shall hardly be able to do business with him. Would it not give the Professor's wife pleasure to visit you for a few days in the village of toads?"

"It would be the greatest pleasure to us," exclaimed Mrs. Rollmaus, "but the house is empty, and is not furnished, and we must manage as best we can, and the victuals, too, as a rule, are cold."

"Only in case of extreme necessity, I mean."

Meanwhile Ilse was walking by the side of the Princess through the groups of citizens making their obeisances, but her heart was not so light as that of Mrs. Rollmaus. The Princess spoke kindly to her, but upon indifferent subjects, and she turned frequently to the other side to her lady. It was clearly not her wish to enter into more conversation with Ilse than was absolutely necessary. Ilse saw clearly that it was a show of favor before the world; she felt the intention of it, and asked herself secretly why it was necessary, and her pride revolted at this graciousness, which did not come from the heart. The Princess kept Ilse for some time in the most crowded part of the promenade.

"I leave the palace to-day," said the Princess, "and go for a few days or weeks into the country. Perhaps I shall have the pleasure of seeing you there."

At parting Prince Victor took off his hat politely, but only said: "The air is becoming sultry."

Ilse brooded over this little incident as she returned with her companion to the Pavillion. She answered the animated questions of Mrs. Rollmaus absent-mindedly, and only gave a half-look at the promenaders, many of whom now took off their hats to her.

Gabriel had prepared some coffee in honor of Mrs. Rollmaus, and had set the table in front of the door. There the ladies sat down. Mrs. Rollmaus looked enchanted at the blooming azaleas, praised the cake of the palace, and still more the princely personages, and chatted away in her best humor, whilst Ilse looked seriously down.

"I have seen some of the princely personages, and I should now like to see the fortune-teller. It is remarkable, dear Ilse, that my valuable connection with the Professor always brings in question the power of soothsaying. It is really not from inconsiderate curiosity that I wish to question this person. It is no object to me to learn about my future. I know sufficiently how this will all be. For to a certain extent we live under natural conditions; first the children come, then they grow up, one becomes older, and if one does not die too young, one lives a little longer. That has never been inscrutable to me, and I do not know what a person could now discover for me. It would, therefore, be some misfortune that would come to pass, and I do not wish to have that prophesied. I wish it only for the sake of instruction, to find out whether such a person knows more than we others. For in our days there are doubts about the powers of soothsaying, and I myself have never had a presentiment, except once, when I had the toothache, and dreamt that I smoked a pipe, which took place and had a nauseous effect; but this cannot be called wonderful."

"Perhaps the fortune-teller knows more than others," replied Ilse, absently, "because she has somehow made herself acquainted with their history."

"I have thought of something," cried Mrs. Rollmaus; "I would ask her about the silver soup-ladle, which, in an inexplicable way, disappeared from our kitchen."

"What will the lady give me if I tell her?" asked a hollow voice.

Mrs. Rollmaus started. At the corner of the house stood a large woman behind the flower-pots; from her shoulders hung a ragged cloak, her head was covered with a dark handkerchief, from under which two flashing eyes were fixed upon the ladies. Mrs. Rollmaus

seized Ilse's arm, and cried out, terrified: "There is the fortune-teller herself, dear Ilse. I beg your advice; shall I ask her?"

The woman stepped cautiously from behind the plants, placed herself in front of Ilse, and raised her handkerchief. Ilse rose and looked annoyed on the sharp features of the withered face.

"The gipsy!" she exclaimed, stepping back.

"A tinkering woman!" exclaimed Mrs. Rollmaus, displeased; "the secret knowledge of such as she is, is connected with poultry-stealing, and worse things. First they steal and conceal, and then tell where the stolen property is."

The stranger paid no attention to the attack of Mrs. Rollmaus.

"You have hunted my people like the foxes in the wood; the frost has killed them; your watchmen have imprisoned them, and those that still live lie within walls, clinking their chains; I rove alone through the country. Do not think of what was done by the men that night, think only of what I predicted. Has it not come to pass? You look on the stone house opposite, and you see how slowly he comes along the gravel-path, to the room in which the naked boy hangs on the ceiling."

Ilse's countenance changed.

"I do not understand what you mean. Only one thing I see, that you are no stranger here."

"Many years have my feet glided through the snow," continued the gipsy, "since I passed through the doors of these black creatures."

She pointed to the angels holding tulip wreaths.

"Now disease has come upon me."

She stretched out her hand:

"Give to the sick woman of the high road, who once went on the same path that you are now treading."

The color rose in Ilse's cheeks; she gazed fixedly on the beggar woman, and shook her head.

"It is not money that I want from you," continued the gipsy. "Entreat the spirit of this house for me, if he should appear to you. I am weary, and seek rest for my head. Tell him that the strange woman on whom he hung this token," she pointed to her neck, "begs for his help."

Ilse stood motionless; her cheeks glowed and her eyes flashed angrily on the woman.

"What will you give to find your silver again?" asked the beggar, in an altered tone, turning to Mrs. Rollmaus.

"So you are the fortune-teller?" said Mrs. Rollmaus, angrily, "and not a penny will I give you. Any one who examined your head would find a fine organism there. I have often heard such gibberish. Away with you before the police come. One of your

people prophesied to my head-maid that she would marry a landed proprietor, and I was obliged to dismiss her, though she had been very useful. She began to attack even Rollmaus himself, although he only laughed at her. Go, we will have nothing to do with you."

"Think of my request," cried the stranger to Ilse. "I shall return."

The gipsy turned away and disappeared behind the house.

"They are scamps," said Mrs. Rollmaus, deeply irritated. "Believe nothing of what they say to you. This one talks worse nonsense than the others. I really believe, dear Ilse, you take to heart what this beggar woman has said."

"She knows this house, she knew well what she says," said Ilse, faintly.

"Naturally," exclaimed Mrs. Rollmaus; "they rove about and peep through all the crevices, they have a good memory for other people's business, but do not remember their own thievish tricks. I have a great suspicion of her as regards my soup-ladle. If this is the famous fortune-teller I am so disgusted as not to care to make any further inquiries. Ah! and you also, I see."

"I know the woman," replied Ilse; "she belongs to the band who stole our children, and wounded the arm of my Felix. Now her uncanny figure comes before me like a spirit, and her dark words excite horror in me. She threatens to return, and terror seizes me lest this woman should once more come upon me unawares. I must away from here."

Ilse hastened into the house, Mrs. Rollmaus followed her, and said, kindly:

"If she comes again, she shall be sent away. The best way of dealing with these prognosticators is to imprison them with bread and water."

Ilse stood in the sitting-room looking timidly about her.

"He who hung the cross upon her was the master of this castle; and when she spoke those wild words to me at the gate of the farm yard, she did not mean my Felix."

"She meant eight shillings, and nothing more," said Mrs. Rollmaus, scoldingly.

"How dare she compare my life with hers? How does she know whether the lord of this house attends to my words?"

Mrs. Rollmaus endeavored in vain to tranquillize her, by sensible observations upon the worthlessness of these female vagabonds. Ilse looked down, with her hands folded, and the consolatory speeches of her worthy friend were spoken in vain.

Strange voices were heard in the house; Gabriel opened the door, and announced the Intendant. The

old man entered the room officiously and begged to be excused for the interruption.

"My most gracious master has commanded me to inquire whether a strolling woman has been begging here. She has slipped into the castle, obtained access to the Princess, and frightened her, just when her Highness was departing for the country. His Highness wishes to warn you against the stranger—she is a dangerous person."

"She was here," replied Ilse, "and talked wildly; she showed that she knew the house."

The Intendant looked disturbed, as he continued:

"A long time ago, her Highness, the deceased Princess, took compassion on a gipsy girl whose mother had died on the high road. She had the creature instructed, and, as she was amusing, and seemed to promise well, she was at last taken into the castle and employed in small services; but she has badly repaid this generous treatment. At a time of heavy affliction in the castle, this person fell back into the habits of her childhood; she took to stealing, and disappeared. To-day, one of the servants recognized the maiden in this strange woman. His Highness, the gracious Prince, who is ailing, was informed of this by his valet and was much excited by it. Search is being made through all the streets and roads for the stranger."

The old man took leave. He looked gloomily after him; but she said with more composure to Mrs. Rollmaus:

"This accounts for the language of the stroller, which sounded different to that of begging people in general, and it accounts for her wish to receive the pardon of the Prince."

But now Mrs. Rollmaus in her turn became depressed and sad.

"Ah, dear Ilse! if the witch has really lived here among these distinguished people, she may know many things that have happened in this house; for people do not speak well of it, and they say that in former times princely mistresses lived here. The house is not to blame, nor are we; it is only because the Hereditary Prince has gone to your father, and you knew him at the University, that people shake their heads at it; it is idle gossip."

"What gossip?" exclaimed Ilse, in a hoarse voice, seizing the hand of Mrs. Rollmaus.

"They say that you are the cause of the Hereditary Prince coming into our country. We should all rejoice if you were to visit your father before you journey, as was intended; but I really believe, as long as the Prince is there, it would be better for you to remain here, or anywhere else. It is only for the sake of prudence," she continued, soothingly, "and you must not take it to heart."

(To be continued.)

BOOK REVIEWS.

PROCEEDINGS OF THE DAVENPORT ACADEMY OF NATURAL SCIENCES. Vol. IV, (1882-84), Vol. V, part I (1884-89). Davenport, Iowa. Published by the Academy.

Before coming to Davenport a few weeks ago we were unaware of the value of its Museum. Having been asked by an acquaintance to visit the place we were fortunate enough to find in the venerable curator, Mr. W. H. Pratt, a friendly and enthusiastic guide, who is ever willing to show and explain the collections under his care to interested visitors. In some departments the Davenport Museum of Natural Sciences is undoubtedly the richest west of Chicago; as to the number of mound builder's pipes,—among them the much disputed elephant pipes,—it takes first rank, having not less than sixty, while the next largest collection extant contains but forty. We cannot repeat here the interesting remarks of our Mentor concerning this collection and the noteworthy tablets but would refer students to the extensive and apparently thorough vindication of the same, prepared by the late Mr. C. E. Putnam, in the latter part of Vol. IV, of the proceedings.

The collection of skulls, taken from mounds and from more recent burial places, is a study in itself. The entomological department, the herbarium, and the great mass of archaeological relics would be attractive to any specialist, not to speak of other treasures hoarded together in that snug little building. There is a sort of scientific air about it, which makes itself especially felt in the library room; it is just the place for lectures on scientific subjects to a select circle; and the student who may have leisure to go there in the morning or afternoon, will find the much needed quiet as well as the material for profitable study. The Academy exchanges periodicals with many scientific institutions all over the world, and we find reports and proceedings in fourteen different languages, the contents of which will be easily accessible when the well advanced card-catalogue is finished.

From what we have seen we can conclude that geology, archaeology, and ornithology are favorite branches of study among the members of the Davenport Academy; and a glance at the above named volumes of proceedings shows the two most extensive articles to be one on ancient pottery (illustrated) by Wm. H. Holmes in Vol. IV, and one on the birds of Iowa by Chas. R. Keyes and H. S. Williams in Vol. V. It is almost unnecessary to add that it will pay any scientist who happens to come to Davenport, to inspect the "Academy of Sciences" on Brady street.

THE LIMITATIONS OF TOLERATION. A Discussion between Col.

Robert G. Ingersoll, Hon Frederic R. Coudert, Ex-Gov. Stewart L. Woodford. New York: The Truth Seeker Co.

This discussion was held before the Nineteenth Century Club of New York, at the Metropolitan Opera House. It is now printed in pamphlet form from a stenographical report, and comprises forty-four pages. The remarks of the late Mr. Courtlandt Palmer, who presided at the meeting, are likewise included. The debate between these three gentlemen, for such it was, is well worth reading, and although from the colloquial form in which it is cast, it has not the literary charm that marks the written compositions of either of the eminent speakers, its dash and general impromptu character afford a pleasing substitute.

The Root of the Temperance Problem—a lecture by J. H. Crooker, Madison, Wis.—is now circulated in pamphlet form. Mr. Crooker's remarks embrace a brief survey of the temperance problem. The writer advocates that there can be no genuine temperance reform apart from the general advance of society. "Substantial progress must come, can only come, from that regeneration of man's nature which consists in that spiritual emancipation where reason and conscience prevail over appetite and which will be brought about by all those educational influences which add to Inner Life."

Universalism, What it is and What it is good for, is a prize essay by Rev. O. Cone, D. D., president of Buchtel College. It is an exposition of "the Christian doctrine known as universalism," which is now preached in "one thousand parishes," and taught in "four colleges" and "three Theological Seminaries." (Philadelphia: Universalist Convention.)

PUBLICATIONS OF "THE OPEN COURT."

DREAMS, SLEEP, and CONSCIOUSNESS.

By GEORGE M. GOULD, M. D.

PRICE 15 CENTS.

The researches of Dr. Gould upon the nature of consciousness, as studied from the facts of sleep and dreams, are highly interesting, not only as affording suggestions of scientific value, but as exhibiting marks of an exact and cultivated introspective talent.

The Idea of God.

By Dr. PAUL CARUS.

PRICE 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing:

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Entheism, the Monistic Conception of God.

THE MARRIAGE PROBLEM.

By E. D. COPE, Ph.D.

PRICE 15 CENTS.

A scientific discussion, from a practical standpoint of a question now engrossing the public attention. Prof. Cope's propositions have evoked much comment and criticism.

Principles of Art.

From the Standpoint of Monism and Meliorism.

By Dr. PAUL CARUS.

PRICE 10 CENTS.

Being a critical dissertation upon the principles of art in every phase of human expression.

MONISM AND MELIORISM.

By Dr. PAUL CARUS.

PRICE 50 CENTS.

Monism is defined as that unitary conception of the world which attempts to explain all problems from one principle, and Meliorism as that contemplation of life which rejects optimism as well as pessimism, finds the purpose of life in the aspiration after constant progress to some higher state of existence, in a word, in perpetual labor towards amelioration. Monism represents the scientific, and Meliorism the ethical aspect of this philosophical system.

The author starts from Kant, points out the dualism in Kant's views and ventures to reconcile it in his monism. His own views are based on an inquiry into Hume's problem concerning the law of causation.

The appendix of Definitions and Explanations will be of special value to students of philosophical topics.

Review of Recent Work of THE OPEN COURT.
PSYCHOLOGY AND PHILOSOPHY.

SENSATION AND THE OUTER WORLD...A. BINET....No. 83.

IDEALISM AND REALISM. EDITOR.....No. 84.

DREAMS, SLEEP AND CONSCIOUSNESS.

M. Binet, after having animadverted upon the impropriety of excluding metaphysical questions from the domain of science, proceeds in the above-mentioned essay to discuss the interesting question of the relation between human sensation and its normal excitant, the external world. No resemblance is predicable, maintains M. Binet, between the perceptions of consciousness and the bodies that exist beyond us. Doctrines enunciating such resemblance, the author declares fallacious, and terms them "crude and naïve realisms." This fallacy, however, is widely prevalent in science. Physicists and philosophers still hold that the definitive explanation of natural phenomena is a mechanical explanation, wherein the concepts of mass and force are the ultimate and fundamental data. They fail to recognize, in this, the purely subjective character of sensations. They translate, merely, sensations of one kind into sensations of another kind, which seem to us more precise; thus, they explain the phenomenon of sound by the phenomenon of a vibration; merely substituting, thereby, a visual sensation for an auditory sensation. This leads the author to discuss the supreme importance of the visual sense in the investigation of phenomena; the possibility of a purely auricular science is held forth; the author shows that the ear, by noting the *qualities* of sound, can solve *numerical* problems. Thus, the progression of human knowledge is accompanied by a progression of human capabilities. The future will transform our sciences; it may transform our senses.

Sensation and the phenomena of the external world, it is granted, are different. But does it follow that knowledge of external objects is therefore impossible? The electrical phenomenon traversing the wire of a telephone bears no resemblance to the spoken words thrown against the mouth-piece in the shape of air-waves; no more so than does sensation the external object. Yet is communication by means of a telephone impossible? Are not the spoken words reproduced at the other end of the line in substantially the form in which they were received? *Preservation of form* is all that is necessary; and this is possible even where there is no superficial resemblance. It is a contradiction to demand that knowledge should be other than it is. Cognition does not, and need not, go beyond sensation.

In Numbers 82 and 83 two interesting letters appear, discussing questions raised by the articles of Dr. G. M. Gould upon Dreams, Sleep, and Consciousness—practical studies upon the psychology of consciousness.

ETHICS AND SCIENCE.

ETHICAL EVOLUTION. PROF. E. D. COPE.....No. 82.

The utilitarian theory of morals, says the distinguished author has found in the law of evolution a permanent substantiation. Yet does that doctrine embrace the *whole* truth, does it embody exclusively the law of human ethical progress? Ethical conduct, it is true, is an outgrowth of natural mental constitution; it differs among individuals, among families, among races; physical necessities, and conditions of environment direct it. But the knowledge of right is an intellectual faculty. Ethical life expresses, further, the highest development of humanity. Accordingly, moral conduct has *various* phrases of evolution: the rational as well as the natural, the individual as well as the social; to which corresponding motives of utility, egoism, and altruism belong. We find these motives interacting, each predominant in their respective spheres. The rational element has found its expression in generalization, in the formation by far seeing men of ethical codes; the affectional element, the element of Love, has found its expression in beneficent altruism, wherein the filial relation to God forms an abiding motive to action. The faculty of reason and the sentiment of love ensure ethical perfection.

PASSIONS AND MANIAS. FELIX L. OSWALD, M.D. Nos. 81, 84.

Interesting essays in moral physiology, abounding in citations from history and science in support of the positions taken.

NEWS ABOUT THE PLANETS AND THE MOON.....No. 80.

This constitutes a survey of the latest astronomical observations. It includes a brief account of the canals on the surface of Mars, with their various attendant phenomena; the rotation of Jupiter; the temperature of the moon; and the strange light-phenomena recently observed in the neighborhood of Saturn.

SOCIOLOGY AND ECONOMICS.

HENRY GEORGE AND LAND TAXATION. WHEELBARROW.....No. 73

CORRESPONDENCE UPON THE DOCTRINE OF HENRY GEORGE.....Nos. 79, 80, 82, 84.

The criticisms by Wheelbarrow, touching the doctrines of Henry George, have evoked much comment and discussion. The main bulk of the correspondence relative to this question, remains still unpublished; showing the wide-spread interest taken in the subject, and the undoubted popularity of Mr. George's theories. The main endeavor of our correspondents seems directed towards demonstrating Wheelbarrows ignorance and misunderstanding of the great economist's position. This Wheelbarrow seeks to refute in a letter in No. 82.

HISTORICAL AND CRITICAL.

THE DILEMMA OF DOUBLE ALLEGIANCE. GEN. M. M. TRUMBULL.....No. 81.

The article by Gen. Trumbull is opportune. Its tone and position is commendable. Amid the chauvinistic fanfaronade of demagogic statesmen and bellicose newspapers, evoked by petty irritations over Samoa coal-stations and bait for cod-fish, the thoughtful citizen of foreign birth must often feel the appalling meaning that the problem of double allegiance embodies. "What is the ethics of patriotism that must guide us in case of actual war?" "The duty of men embarrassed by the ties of double allegiance," says Gen. Trumbull, "is to stand bravely by the republic whatever comes, but they ought to unite their moral and political influence to promote the settlement of all international disputes by peaceful arbitration." The question has excited much comment from the press throughout the country.

THE UNIVERSAL FAITH.

A MONISTIC, POSITIVE, HUMAN, CONSTRUCTIVE RELIGION.

BY T. B. WAKEMAN.

IN the remarkable discussion* between Frederick Harrison, the English Headcentre of the Comtists, and Prof. Thomas H. Huxley, the distinguished scientist, and the originator of the happy term "Agnostic," the most noteworthy passage is the following which we may call *Prof. Huxley's Profession of Faith*.

"That a man should determine to devote himself to the service of humanity—including intellectual and moral self-culture under that name; that this should be, in the proper sense of the word, his religion—is not only an intelligible, but, I think, a laudable resolution. And I am greatly disposed to believe that it is the only religion which will prove itself to be unassailably acceptable as long as the human race endures."—PROF. HUXLEY.

This frank and noble statement by the great Scientific Agnostic is indeed a jewel; a prize, to be carefully treasured up out of a discussion otherwise to be regretted, because tending to dis sever and dissipate influences and efforts which might cooperate to realize that self-same religion.

That this statement is true, and that it is the substance of *The Universal Faith* which ought to influence intelligent people, has been for years the solid conviction of a number of those who adhere to the *American Secular Union*, who have been largely influenced by the works of Auguste Comte, and who are known as "Republican or American Positivists," but who have no connection with, and are in no wise recognized (except in their *anathema*) by the Comtist Papacy of which Pierre Lafitte (Peter the First) is grand Pontiff at Paris, and of which Dr. Richard Congreve and Mr. Frederick Harrison are the most distinguished English Hierophants.

One of the best known of this Republican School of Positive Religionists was Mr. Courtlandt Palmer, of New York, whose recent decease has been regarded not only by them, but by the liberal elements of our country generally, as an irreparable loss. THE OPEN COURT gave a friendly and appreciative recognition of the religious views of Mr. Palmer on the occasion of publishing (No. 71, Jan. 31, 1889) my address on that subject at the Memorial Meeting held in his honor

by the Nineteenth Century Club, of New York, of which he was the founder and president. The Statement of the Universal, Monistic, Republican Religion in that address excited an interest which has called for further exposition, and no text could be more timely than the precious words above quoted from the Father of the Agnostics; a text, which we wish to repeat, and to emphasize by a fair explication of some of its implications.

The religion it describes as "devoted to the service of humanity," and "including" as its means "intellectual and moral self-culture," is the religion upon which, as it seems, all sensible people ought to agree as really true and good. Such general agreement added to its general complete and verifiable nature makes it at once synonymous with the general and universal faith or religion to be taught and practiced by man—in a word with the *Positive and Monistic Religion of Science*.

Next, it is evident, and is admitted, that this religion in order to include "intellectual self-culture," must rest upon that which is true, that is, upon *Science*, instead of notions which are unverifiable or unknowable to the intellect. In a word, this religion must, at its first step, satisfy *the head* by its truth.

Again, this religion, in order to "include moral self-culture," must rest upon morals and duty as distinguished from police or forceful laws: that is, moral conduct sanctioned by the intentions, motives, and emotions. This religion must also, therefore, by its culture of the intentions and emotions satisfy, educate, and enable *the heart*.

Lastly, this religion is to determine its believers to devote themselves "to the service of humanity." We may spell the last word with a little *h*, when we consider the dark side of human nature, as the Professor does in the words about "apes" etc., which follow our text; or we may spell it with a capital *H*, when we consider the good in Humanity as a basis of historical and social evolution, as Comte showed us how to do, as Mr. Harrison has done in his "Meaning of History," and as Herbert Spencer (our philosophic Balaam) has proved it the right thing to do, in his *Sociology*.

What is the result? Why, we have "a religion" on hand again, with the same problems and very similar

* Reprinted in *The Truth Seeker*, and *The Popular Science Monthly*, New York City.

solutions, that the terrible, "asphyxiating" Comte gave us when we began to study Positivism 30 years ago: The three *H's* and the three *P's* still confront us, *viz.*:

The *Head* must have a true *Philosophy*.

The *Heart* must have a satisfying *Poesy*.

The *Hand* must have a beneficent *Polity*.

All these *H's* are to be reasonably devoted by "self-culture" to the service of humanity as the evolutionary, social, and moral source, centre, test, aim, object, and joy of all. The clear head; the loving heart; and the helping hand:—Such seems to be the substance of the new religion by whomsoever stated, and under whatever name. How, for instance, does this programme differ from that of the Agnostic Professor? Why may not all Scientists, Agnostics, Positivists, Secularists, Socialists, and Reformers and well-wishers of their kind agree in his statement of the new religion? To so agree in a frank, practical, and honest, instead of a personal and disputatious spirit would certainly be the first step of a great advance towards its realization.

The next step would be to settle the three *P's*, so far at least, as to have a working base and method; and in so doing, we would have that inquiry under an intellectual and moral guide, (*viz.*, the service, that is, the good and glory of humanity,) the effect of which would almost of itself ensure, as to the result, a mighty power of agreement. For, under this scientific human test, the questions to be asked and answered are only two: 1. *Is it true?* 2. *Is it good?* That is, does our subjective agree with the objective order; our thoughts with things and their facts, laws, and processes. If so, do these, our ideas, notions, and feelings, care for and tend towards the good of the individual and the race?

1. If we apply these tests to the first question: *Which is the true Philosophy?* ought the Scientific, and therefore the intelligent world, to differ much about the substantial answer? The scientific method of verification stands firm. There is the Copernican Astronomy with its improvements from Bruno and Galileo to the Lick telescope: there are the immensities of space and time, and within them the "phenomenal" changes which we sense and call "matter": these changes are found to be correlates of each other, and the law of "the equivalence of forces" results. Each change is the centre of changes correlative in its environment and which extend by similar correlations in ever widening circles as we trace them, until they are lost in the infinite. Thus science leaves us only a *Monistic* world.

These things being so, every other philosophy, except the correlative or scientific, is ousted. There is no crack or cranny left between the correlates (which are the "causes" of each other) in which a god, spook, or entity, or miracle of any kind can be found or inserted. But the world, or universe, is conceivable only

as infinite. There is, then, no place or room for causative or creative beings, within, before, or outside of the world. "Miracles do not happen." It follows that all theological and metaphysical philosophies are excluded by the simplest and most general facts and laws of science, and that a scientific classification of scientific knowledge is the only correlative, that is the only scientific, monistic, and positive philosophy possible. To achieve this philosophy, which is the knowable explanation of our world, is the greatest triumph of our race.

It is no answer to this conclusion to say, as Professor Huxley seems to do, that Comte tried to elaborate this philosophy, and that he did not know enough to do it well. To the great scientists who make this reproach the answer falls with crushing force: "It is your duty to supply, as speedily as possible, the defects of his time and his personal limitations, instead of trying to discredit the philosophy itself and the good work he may have done towards it." Even Mr. Spencer thought it well to borrow from Comte the fundamental words "sociology" and "altruism," and it does not appear that "synthetic" or "cosmic," is better than "positive" or "correlative" or "monistic" as a trade mark of the new unitary and scientific philosophy. The trouble with the Spencerian and Fiskian philosophy is that it is essentially dualistic and metaphysical. Comte, insufficient, verbose, and crude as he may be, avoided their capital error: *he no where breaks the back of the world*. His ultimate is *one*, unitary, correlative universe, of which the highest correlate, flower, and outcome, is *human love*, the co-operative unitary power of the human race. Upon this one infinite world, in its two aspects: 1. As *objective* or the "Not I" to man; and 2. As *subjective* or related to the "I," *i. e.*, subservient to man, he founds the future of the human race. All science since his day has confirmed this position. As long as the *extant*, *unity*, and grandeur of the mighty foundation he laid for the future activity of Humanity remains unrecognized, blaming his style and magnifying the defects of his ignorance and of his personality, can justly excite little more than contempt. Just as Kant, and all the thinkers between Hume and Comte, are to be understood, if at all, in relation to that great "sceptic," so Spencer and all of the scientists since Comte must have him and his work as their background to make any solid philosophical and moral sense of their works. For without some unity, some correlative outline, sustaining the true and good, they are only disjointed and incoherent chunks of intellectual and moral anarchy ending in "Administrative Nihilism," as Prof. Huxley has admirably proved in his essay under that title. Since the old divine and spook philosophies went out under the light of correlation, Spencer and the special

scientists have done invaluable work, but its philosophic value seems to be that they have been (often unconsciously) useful commentators upon, and amenders of the unitary positive philosophy which Comte founded, and which still stands as the base of the scientific philosophy upon which any religion satisfactory to the intellectual and moral nature of man must rest. This is so, because it first gave philosophic meaning to the four fundamental corner stones or conceptions of such a philosophy and its consequent religion, *viz.*:

a) *The relativity of human knowledge*, and its consequent limitation to the correlative and phenomenal as the knowable.

b) *The classification of the sciences*, reaching from the distant homogeneous nebulae through the domains of astronomy, physics, chemistry, biology, sociology, and ethics to individual psychology and morals.

c) *The evolution of human history and civilization*, revealing a progressive order through fetichism, sabbatism (astrolatry), polytheism, monotheism, pantheism, to positive monism, with consequent humanism, social and moral.

d) *The conception of humanity as a great social organic being*, acting in continuity (as above stated, in history) and in solidarity under international law and politics, and so ideally and practically becoming a criterion and test of political and moral action to mankind.

e) The superstructure upon these corner stones can be none other than the new religion, the Monistic Universal Faith; the Religion of Science, and Humanity.

After years of consideration of the attacks of "Spencer and Co." upon these corner stones the verdict must be in the words of Mill and Bain in regard to their attacks upon his Classification of the Sciences, that they "have made out no case." Since Comte's day the great laws of correlation and evolution have made these corner stones immovable. Is it not time for the second thought of this generation to end all envious or idle criticisms, and to begin the practical work of constructing, teaching, and living the new religion?

2. If so, we are called to pass from the Philosophy to the *Poesy* or Art of the new Faith, that is, its satisfaction of the emotional nature of man. Under the test questions, 'What is true, What is good,' in this domain, the answers agree generally, that the objects of art are the culture, enjoyment, and education of our heart or emotional nature. All agree further as to the prime importance of this culture, for "out of the heart are the issues of life": the ideal is the permanent, the temporal and transitory only the symbol, as Goethe tells us in closing *Faust*, and in so many other beautiful ways and places. "The imagination, says he, "is indeed a grand faculty, but I like it not

when it plays with facts." That is, the scientific, objective truth must be inviolable. The true in art is the ideally true. The imagination "bodies forth things all compact" and makes by its *poesy* (*ποίησις*) an ideal world for the culture, ennoblement, and pleasure of man. By music he flies to a higher life! Here we have the method by which falsehood, and theosophic and metaphysical fog are ousted out of art, and the whole range of its creative powers is ennobled by the resultant good and joy and glory of man.

Thus, for instance, the grand expansion of our cosmic emotions in natural poetry, in landscape-painting and gardening, by which the feelings lead the intellect in annexing the Cosmos to Man, is but the heart's reading and prophesy of the new monistic and natural philosophy on its æsthetic side.

A similar expansion of art in the human and historical world attends the extension of the theory of the evolution of civilization as we have it scientized in Kant, Herder, Condorcet, Comte, Guizot, and Spencer.

This new cosmic and human feeling, which is the predecessor of the new religion, is so manifestly triumphing in architecture, sculpture, poetry, painting and music, that the new life, the free human life it creates, is demanding a newer and a better polity by ever renewing political agitations, if not revolutions.

3. We are thus brought to the third, the practical and social domain which the new religion will gradually transform. What will be the *Polity* of the future? is the question. Unless we are to stumble on blindly, we are to take such answer as historical and social evolution indicates. The Germanic, Anglo-Saxon, American peoples, and their advanced philosophers and leaders, believe that the future indicated is the Federative Commonwealth, resting upon coöperative democracies enjoying "home rule," of which the Swiss and American Republics are, so far, our best prototypes, but far enough from perfect.

Comte, on the contrary, following the traditions of the Latin races and his own catholic and loyal descent, and influenced largely by De Maistre's powerful book on 'The Pope,' took it for granted at the beginning of his elaboration that its outcome must be a grand revival of the Papacy with science as its creed, a Pope of the civilized world at Paris, and a temporal power divided into countries so small that they could never, like the Princes of the Middle Ages, make any practical resistance to the Pontiff, the Lord of the hearts and minds of his race, and therefore of their lot and fate.

We have pointed out that the laws of correlation and evolution have in substance confirmed the philosophy and poesy that Comte founded; would that the truth could be admitted with equal frankness that those laws have vetoed for ever the *form* of the Positive Polity that

Comte proposed. In a word this papal business in all its letter, spirit, and purpose is wholly wrong: that is, it is *wrong* or twisted out of the true course of human evolution. It is an anachronism, a fossil made to order. Very like the attempt of the Mormons to re-establish the patriarchal polity in Utah is this attempt to recall and reform the Hierarchical Papacy of the Middle Ages. This Mormon illustration of Prof. Huxley, original with him, is an old one with us, but none the less true and instructive. We cannot go over the case at length. Had Comte been of German, English, or American parentage and education his papal polity would never have been dreamt of. As Mill has pointed out in his review of Comte, this polity is reached by defying evolution. It ignores the political meaning of Protestantism and the consequent revival of the temporal powers, with attendant mental, emotional, and religious liberty,—clearly indicating, as theology and metaphysics decline more and more, the rise of the "Federation of Mankind and the Parliament of the World." Comte's polity was *prehistorically* defeated by the victory of Hermann over the Romans, of Luther over the Pope, of Elizabeth over the Armada, and of Wolfe over Montcalm, at Quebec. The sceptre has forever passed from the Latin races and their imperial and papal politics, to the peoples themselves, who are organizing as coöperative, social, democratic, representative republics the world over. The best thing the Latin nations of Europe can do is to fall into the republican line, as their Latin descendants in Central and South America have done, and as France is trying to do. That all clearly indicates that the separation of the temporal and spiritual powers of which Comte writes so approvingly will evolve as a fact—a fact not at all possible under any form of Papacy, which is, and must from its nature ever be, an incubus upon all minds and hearts. The law and the aspirations of mankind are towards universal, mental, and emotional liberty. This can only result from the limiting of government to "home rule" in temporal affairs, administered by democracies, and yet federated so as to form an invincible republic.

The early Christians by their "kingdom not of this world," did for a time sever the two powers and free the heart and soul of man from the Roman temporal empire, but soon Constantine gave them over to the papal empire which, still worse, crushed the very brains and hearts of men. The law of evolution points not back to either of these oppressors, but forward to the "Federated Republic" of the civilized peoples, whose glory it will be to secure the greatest possible freedom of mind and heart and body, and at the same time the most extended and useful administration of human affairs.

All this neither Comte nor his disciples have ever

been able to see. He awarded to the United States a position in history, merely "colonial," and had no evolutionary conception of what the modern world had been about in politics since the Middle Ages. His influence has, therefore, been *nil* or retrograde. Hope there has been that Frederick Harrison would turn the Comtist faces to the future, and not permit evolution to force them into the ideal heaven unwillingly and with their backs to the light; but the conversion (turn-about) has, it seems, yet to be made. The first duty they owe to their great master is to reverse his great evolutionary error. It is that error with its spirit and concomitants, which defeats their good objects, and makes their whole movement disgusting not only to Mr. Spencer and Prof. Huxley but to thousands, who would otherwise gladly aid them the world over. When the Republic takes the place of their Papacy in their programme, they will be the great benefactors of humanity. Until then they can only play, under evolution, the part of Charles Lamb's antiquated friend who never could "keep abreast with his age, but was nevertheless dragged along in the procession."

In the meantime, as James Parton, our biographer of Voltaire, told the Nineteenth Century Club, in his lecture on The Coming Man's Religion, "the proper and practical religion of a citizen of the United States is, in the first instance, The United States of America." For us the new religion takes hold right there. Through their republics the people will regulate, administer, and protect, but without an organization of the new religion, how can they acquire the *motive*, "the intellectual and moral self-culture," to perform those functions wisely?

That question we leave to THE OPEN COURT, as an exponent of the New Faith, to answer, if it can or will.

PERSONALITY—INDIVIDUALITY—CONSCIOUSNESS.

BY TH. RIBOT.

Translated from the French by γηλυ.*

It is above all necessary to explain what in psychological language is understood by the term "person." Person, is the individual clearly conscious of itself, and acting accordingly; it is the highest form of individuality. Metaphysical psychology exclusively reserves this characteristic for man; but while attempting to explain the same, it merely supposes an ego that is a complete unity, simple and identical. This, however, is the mere semblance of a definite solution of the problem. Unless we attribute to this ego a supernatural origin, it will be necessary to explain, how it is born, and from what lower form it proceeds.

Experimental psychology does not propose the problem in the same manner, or treat it according to the same methods. Experimental psychology learns from natural scientists that in many instances it is

* *Les Maladies de la personnalité.* Paris, Félix Alcan.

difficult to determine the characteristics of individuality, even of those creatures that are by far less complex than those of persons. Hence it mistrusts any purely simple solution, and, far from regarding the question as settled, as it were, at the first onset, at the close of its researches, views the very problem itself as rather the result of long and laborious investigations. Therefore, it is but natural that the representatives of the old school, after once having lost their true bearings, should groundlessly accuse the adepts of the new school of actually purloining their ego. But on either side both language and methods have now become so different, that all mutual understanding henceforth will be impossible.

It will be necessary, even at the risk of increasing the already extant confusion, to investigate what teratical, morbid, or simply rare cases can teach us concerning the formation and disorganization of personality, yet without assuming to treat the subject in its totality.

Personality, being the highest form of psychic individuality, there spontaneously arises another preliminary question: what is individual?

In answer to this much debated question it is here sufficient to observe, that careful physiological investigations prove that the psychic individual is the expression of an organism; in conformity with the latter, it is either low, simple, incoherent, or complex and unified. Descending the whole series of animated beings, we see how the psychic individual is always formed through the more or less complete fusion of more simple individuals. "A colonial consciousness" is created through the coöperation of local consciousnesses. The discoveries of modern naturalists, in this respect are of the utmost importance to psychology, because they completely transform the problem of personality. The latter henceforth must be studied from below—from the lowest step of the ladder.

Thus we are prompted to ask, whether the human person itself is not also, *un tout de coalition*—a whole by coalition, the extreme complexity of which veils from us its origin, and whose origin would remain impenetrable, if the existence of elementary forms did not throw a certain light upon the mechanism of this fusion. In fact, the human personality is an aggregated whole, a complex. In order to know it, we must analyze it; but the analysis here is fatally artificial, because it disjoins groups of phenomena, which do not merely stand in juxtaposition, but are really coördinate, their relation being not of simple simultaneousness, but of reciprocal dependance. And yet, this work of analysis is altogether indispensable and we must severally undertake to investigate the *organic*, *emotional*, and *intellectual* conditions of personality, at the same time laying due stress on occurring anomalies and disorders.

Before entering upon the exposition and interpretation of facts, we must clearly understand the nature of consciousness. We are here confronted by two hypotheses, to wit: the old hypothesis, which regards consciousness as the basic property of soul, as the essence of spirit; and the modern hypothesis, that regards consciousness as a phenomenon, superadded to the cerebral activity; as an event, having its own conditions of existence, appearing or disappearing, and at the mercy of circumstances. The old hypothesis, at all times, was radically unable to explain the unconscious life of spirit. For a long while it even entirely overlooked the problem, yet later was compelled to admit so-called "unconscious states," although they were but an ambiguous, half-contradictory expedient.

The modern hypothesis is simpler, clearer, more consistent. It expresses the unconscious in physiological terms, as states of the nervous system, and not in psychological terms, as latent ideas, or non-felt sensations. Yet this is only one side of the hypothesis at issue.

Like all general terms, consciousness must be resolved into concrete data. There does not exist will in general, but volitions, and in a like manner there is no consciousness in general, but only states of consciousness. The latter are the reality.

It would be idle to define consciousness as: "the fact of being conscious," for this is merely a datum of observation, a final fact. Physiology teaches that its production is always associated with some activity of the nervous system, particularly of the brain. The reverse, however, does not take place. All psychic activity certainly implies nervous activity, still, all nervous activity does by no means imply psychic activity—nervous activity being far more extended than psychic activity. Consciousness, accordingly, is something superadded.

In other terms, we have to bear in mind, that every state of consciousness is a complex event, conditioned by a particular state of the nervous system. This nervous process is not an accessory but an essential part of the event, and, moreover, is its basis and fundamental condition. As soon as produced, the event exists *in* itself; as soon as consciousness is added to it, the event exists *by* itself. Consciousness completes and perfects the event, but does not constitute the same.

This hypothesis easily explains how all manifestations of psychic life, sensations, desires, feelings, volitions, memories, reasonings, inventions, etc., may alternately be conscious and unconscious. There is nothing mysterious in these alternations, since in all cases the essential conditions, *i. e.*, the physiological conditions, ever remain the same, and consciousness is but a perfectionment.

Yet, why is this perfectionment sometimes super-added, and at other times lacking?

If in the physiological phenomenon itself there was not something more when consciousness is present than when it is absent, we should indirectly adjudge victory to the adverse hypothesis. Could it be proved that every time certain physiological conditions exist, consciousness will appear; that whenever they disappear, the former disappears; and whenever they vary, also consciousness varies—this would no longer be an hypothesis, but actually a scientific truth. We are still very far from this point.

At all events, we may be sure that consciousness itself will not furnish these revelations. As Maudsley justly observes, consciousness at the same moment cannot be effect and cause,—cannot be itself and its molecular antecedents. It lives but for a moment, and cannot through a direct intuition return backward as far as its own immediate physiological antecedents; and moreover, to go back to its material antecedents, would be to lay hold of, not itself, but its own cause.

At the present moment it would be chimerical to attempt even a broad determination of the necessary and sufficient conditions of the apparition of consciousness. We know, indeed, that the cerebral circulation, in the double relation of the quantity and quality of the blood, is a matter of great importance. A striking proof of this is furnished by experiments, performed upon the heads of recently beheaded animals. Psychometric researches demonstrate every day that the state of consciousness the more it is complex, requires proportionately a greater length of time, and on the contrary, that automatic acts—whether primitive or acquired and the rapidity of which is extreme—do not enter into consciousness. We may, moreover, admit that the apparition of consciousness is attached to the period of disassimilation of the nervous tissue, as Herzen distinctly has shown.* All these results, however, are only partial conquests; but, the scientific knowledge of the genesis of a phenomenon supposes the determination of *all* its essential conditions.

The imminent future, perhaps, will furnish these. In the meantime, in order to corroborate our hypothesis, it will be more profitable to prove, that it alone explains, not purely a condition, but the principal character of consciousness,—its *intermission*. In order from the outset to avoid all equivocation, I may observe that here it is not the question of the discontinuity of the states of consciousness among themselves. Each state of consciousness has its limits which, while allowing it to associate with the others, at the same time will protect their respective individualities. Here

it is not the question of this, but simply of the well-known fact that consciousness has its interruptions, or as is said in, popular parlance: "Man does not always think." It is true that this assertion has been contradicted by the majority of metaphysicians. As a matter of fact they never have furnished any proof for the support of their thesis, and as all appearances are against it, the *onus probandi* would legitimately seem to be incumbent on the former. Their whole argumentation reduces itself to maintaining that since soul is essentially thinking, it is impossible that consciousness should not exist on any degree whatever, even when there remains no trace of it in the memory. But this is simply begging the question, since the hypothesis maintained by us contests precisely their major premise. Their alleged proof is definitively but a deduction drawn from a contested hypothesis. Leaving aside all *a priori* solutions let us examine the question in itself. Let us leave aside the cases of syncope, provoked anæsthesia, epileptic vertigo, coma, etc., and abide by what is more common, more frequent, to wit: the psychic state during sleep.

One has maintained that there is no sleep without dreams; but this is a purely theoretic assertion, and a consequence of the above-mentioned principle, that the soul always thinks. The sole argument of fact that they can plead, is to the effect, that sometimes the sleeper, addressed or questioned, may answer in a sufficiently pertinent manner, and at his waking will have no recollection of the matter. Still, this fact alone does not justify any general conclusion and to the theory of the metaphysicians physiology opposes another. Physiology lays stress on the fact that the life of every organ comprises two periods: the one of relative rest or assimilation, the other of activity or disassimilation; that the brain makes no exception to this law and that experience shows, how the duration of sleep at different times and in the different circumstances of life stands in direct ratio to the craving of assimilation. The cause is the necessity of repairing the losses sustained; of making nutritive circulation follow upon functional circulation. During the state of being awake the brain consumes more of materials than the blood furnishes, so that oxidation soon diminishes and along with it the excitability of the nervous tissue. The experiments of Preyer prove that sleep then will overtake the subject, when through prolonged activity the substance of the brain, like that of a fatigued muscle, is encumbered with a quantity of acid waste material (*detritus*). Even the presence of these products at a given moment will stop the cerebral activity, and the latter does not reappear before rest has allowed the complete elimination of these waste products. It must be admitted, that complete, absolute sleep, without dreams, is the exception; but

* *Revue Philosophique*, Vol. VII, p. 352, and *La Condizione fisica della Coscienza*. Rome, 1879.

that it actually occurs, and not unfrequently, suffices to establish the intermittent character of consciousness.

The last point to be examined is the theory that regards consciousness as a phenomenon. The theory is the offspring of the following basic principle in physiology: "Reflex-action is a type of nervous and the basis of all psychic activity." Those who regard consciousness as a phenomenon, have sometimes defended their theory in a form that has caused them to be called the theorists of pure automatism. They love to compare their "conscious phenomenon" to the flying sparks from a steam-engine, lighting it up for an instant, but having no effect upon its speed. This may sound well enough purely as a metaphor, but would be an exaggerated and inexact view of the real efficacy of consciousness.

Even from the exclusive point of view of the survival of the fittest, the apparition of consciousness upon earth constitutes a fact of the greatest magnitude. Through consciousness experience which is an adaptation of a higher order, became possible. But we have not now to investigate its origin. Very ingenious and clever hypotheses have been advanced on this subject, which all belong to the domain of metaphysics, and which experimental psychology refrains from discussing, while simply accepting consciousness as a *datum*.

It is highly probable that consciousness has been produced, like every other vital manifestation, at first only in a rudimentary form and apparently without great efficiency. But as soon as it left behind a vestige, to constitute in the animal a memory for the psychic sense, to store up its past for the profit of its future, from that moment, undoubtedly, a new chance of survival was effected.

To the unconscious adaptation, blind, incidental, dependent on circumstances, there was superadded a conscious adaptation, dependent upon the animal itself, more certain and more rapid than the former; and in reality this conscious adaptation has shortened the work of selection. Such has been the part played by consciousness in the development of the psychic life.

AGNOSTICISM AND AUGUSTE COMTE'S POSITIVISM.

THE positive philosophy of Auguste Comte has been most severely attacked in England by those who should have hailed the French thinker as their best ally and co-worker, by Mr. J. S. Mill, Mr. Herbert Spencer and Professor Huxley. And yet all three are inspired, like Mr. Comte, with an arduous and holy zeal to free the human mind from traditional dogmatism; all three have devoted their lives to establish a new philosophy of radical free thought. But what is stranger still, all three, especially Mr. Spencer and Prof. Huxley, are entangled in the very same error as

their great French predecessor. They all together believe in the unknowability of absolute existence, of the unconditioned, of that which lies beyond phenomena, and thus failed in their aspirations to present a philosophy of positive science. They did not succeed in liberating us from mysticism. They all are Agnostics.

M. Comte observes* that there are three phases of intellectual evolution, for the individual as well as for the mass: the *Theological* (or *Supernatural*), the *Metaphysical* and the *Positive*.

In the theological phase the mind explains phenomena in a mythological way as the productions of supernatural agents. In the metaphysical phase the supernatural agents are set aside for abstract forces and entities. In the positive phase the mind, convinced of the futility of all enquiry into causes and essences, restricts itself to the observation and classification of phenomena, and to the discovery of the invariable relations of succession and similitude which things bear to each other: in a word, to the discovery of the laws of phenomena. "The metaphysician," M. Comte says, "believes he can penetrate into the causes and essences of the phenomena around him, while the positivist recognizes his incompetency and limits his efforts to the ascertainment of the laws which regulate the succession of these phenomena."

Between the second and third phase, according to M. Comte's definition, there is no other essential difference than the "conviction of the futility of all enquiry into causes and essences." And this conviction is the main doctrine of agnosticism. M. Comte accordingly was truly an agnostic before Prof. Huxley invented the term, and before Mr. Spencer wrote his *First Principles*. All the difference between M. Comte on the one hand and agnostic thinkers on the other are of secondary importance. They are like sectarian divergencies among denominations of the same creed.

We consider as M. August Comte's greatest merit—aside from his ardent enthusiasm for truth in philosophic enquiry, and for reform in our state of society—the invention of the term "positive" which is a very expressive word. But we do not understand by "positive," as does M. Comte, any limitation of the human mind. We understand by "positive" the monistic view of a unitary conception of the world.

Positivism, as we should express ourselves, recognizes that the so-called phenomena are positive facts, that there are neither causes nor essences behind them, that Absolute Existence or the Unconditioned, or the Metaphysical (or by whatever name the Unknowable may be called) are chimerical nonentities, self-contradictory conceptions, and impossibilities.

* Compare "Comte's Philosophy of the Sciences," by G. H. Lewes, pp. 10, 11, and 18.

By experience only man becomes familiar with the facts of existence. The facts of existence are no phenomenal sham; they are real, and knowledge means the systematic arrangement of experiences.

M. Comte erroneously considered Kant as the representative metaphysical philosopher. In truth it was Kant who struck the first vigorous blow at the errors of ontology and the belief in absolute existence, while M. Comte was still as deep entangled in metaphysicism as are his English rivals and opponents, the partisans of agnosticism.

We are little helped if we are told that we can never know anything about the causes and essences of things and that the Unconditioned is an inaccessible province which we should not attempt to enter. This view which is so excellently and adequately called agnosticism, appears from our conception of positivism, as a transition from the metaphysical to a truly positive phase. It is the last remnant of dualism. In the philosophical conception of agnosticism, the metaphysical essences have faded into vague unknowabilities and will disappear entirely as soon as the idea of absolute existence is recognized as untenable ground—as soon as philosophy is conceived as a unitary conception of the facts of reality.

P. C.

PROF. HUXLEY'S CHURCH.

MR. WAKEMAN has referred to Prof. Huxley's Profession of Faith; as to the kind of church appropriate to that faith, the Professor has left us in no doubt, as will be seen from the following passage from his celebrated article on "Administrative Nihilism":

"Again, I suppose, it is universally agreed that it would be useless and absurd for the State to attempt to promote friendship and sympathy between man and man directly. But I see no reason why, if it be otherwise expedient, the State may not do something toward that end indirectly. For example, I can conceive the existence of an established church which should be a blessing to the community—a church in which, week by week, services should be devoted, not to the elevation of abstract propositions in theology, but to the setting before men's minds of an ideal of true, just and pure living; a place in which those who are weary of the burden of daily cares, should find a moment's rest in the contemplation of the higher life which is possible for all, though attained by so few; a place in which the man of strife and of business should have time to think how small, after all, are the rewards he covets compared with peace and charity. Depend upon it, if such a church existed, no one would seek to disestablish it."

CORRESPONDENCE.

EXTRACTS FROM OUR CORRESPONDENCE CONCERNING THE SINGLE TAX QUESTION.

J. G. GALLOWAY, Dayton, Ohio.

"It is not proposed nor inferred by Mr. George to take the whole income of a man's farm who works for his own living. But that part of the income which Tom Clark's children may be able to extort from the children of other men, as rent for the privilege of living on the earth."

A. H. SAWYER, Billings, Montana.

"I should like to ask 'Wheelbarrow' one question and one question only with respect to his article in THE OPEN COURT of March. 21. Should a cyclone strike Tom Clark's farm and entirely destroy the results of Tom Clark's labor even to the turning of the wild sod back in the furrow, and Tom Clark's farm or rather farm site should still retain a value, who or what has produced that value? that being the value which single tax men call land value."

JOHN MILLS, New York.

"Tom Clark will be taxed upon the value of outlying contiguous land; and this you say is one dollar and a quarter the acre. This is just what Tom will be required to pay taxes on; no matter how many barns, houses, fences, and the like he may put up. If, however, a saw-mill is started near by, and this is followed by a wood working factory, and soon a branch railroad comes swooping down upon him erecting a depot, followed by schoolhouses and a town hall, additional manufactories and enterprises leading up to an extensive population until outlying contiguous land is worth one thousand dollars per acre or more, then Tom will be required to pay taxes upon this increased valuation. If this be too great a tax for profitable farming Mr. Clark can sell his property for a sum that will abundantly remunerate him for all his outlay of labor and capital. Cleared from superfluous verbosity this is all there is to land value taxation."

JOHN S. WATTERS, New Orleans, La.

"Land is that great necessity without which men cannot exist. The land trust is the unspoken, unwritten, perhaps unconscious, but nevertheless effective combination among the owners of land, to demand from users the last cent they possess for the privilege of using it. Private, exclusive, individual possession of land is essential. So is private possession of a portion of the atmosphere essential. In winter men heat a portion of the atmosphere in their houses. Possession must be guaranteed; but who would think it possible for a man to own air?"

W. E. BROKAW, Bristol, Dakota.

"Let me give him a little maxim as a touch-stone, which he can easily verify, but which he cannot refute, viz.: Land values rise or fall in proportion to the increase or decrease of population. Where land is monopolized the value rises or falls in proportion to the expectation of increase or decrease of population. This latter is mere speculative value. If 'those who have invested their capital in land,' are 'entitled to be protected in their possession' because of such investment, then the purchaser of a stolen horse is entitled to a similar protection. If not, why not?"

J. G. MALCOLM.

"On the George principle of taxation a man like Mr. Clark living on a farm having no value except the improvements upon it would have no taxes to pay. At present such men have to pay local taxes, and tariff taxes, and are burdened with taxes every time they turn around. Under George's plan, if his land had not increased in value, only to the extent of the improvements upon it, he would not be taxed more than on the purchase price, \$200. This at five per cent. would only be \$10 a year. Mr. Clark probably pays ten times that now every year in tariff taxes alone."

T. W. WITTLER, Chicago.

"Now we single taxers desire to encourage such improvements, and therefore when we apply Mr. George's doctrine of taxation to Tom Clark's farm, we exempt those \$300 (this being the value of the improvements) from all taxation. Therefore all the taxes Tom Clark would pay if the single tax were in force would be on the \$200 which represent the value of the farm before any improvements had been put upon it. His portion of taxes under the single tax system would be (basing my figures on the

present rate of interest) \$8 a year. But what would Tom Clark gain by the change? Let us see; remember all taxes outside of the single tax would be abolished."

W. H. VAN ORNUM.

"The value of the land must still be determined by what it would be worth were it swept clear of all improvements. In other words, the improvements being made by Thomas Clark belong to him and are not considered in determining the value of the land, that equal right of all is satisfied by allowing Thomas Clark to retain his possession and use, on payment into the public treasury of as much as any one of the people would give for such use. But if Thomas Clark cannot afford to pay as much as some one else—cannot put it to as good a use, he simply sells his improvements to the new occupant and goes elsewhere. The rights of Thomas Clark are protected and respected, and the rights of the community are satisfied."

WM. C. WOOD, M. D., Gloversville, N. Y.

"Does not location, *i. e.*, nearness to schoolhouse, factory, mill, railroad station, market, post office, and church make a difference in the value of a farm? Does the erection of buildings and fences, the planting of orchards and the digging of wells as well as other improvements add to the value of that farm? If both questions are answered as they must be in the affirmative I have yet another. Is not the first value described, a value that arises external to and separate from the owner of the farm as an individual, and which he helps create only as a single item of the sum total which makes up the community? Is not the second value, however, an individual creation, the result of the application of his labor, skill, and intelligence to the land? The first value, the single tax would levy upon, the second it would not touch."

MICHAEL CORCORAN, Lincoln, Neb.

"Wheelbarrow" is right. Henry George has clearly promised the millennium to his disciples. It was only the other day that a few young men were discussing the 'Panacea' in a very animated manner. One fine young fellow, a friend of mine, seemed wounded to the heart because I said that Henry George made such ridiculous claims for his pet tax. In point of fact I compared Henry George's claims to a column and a half of all the ills that flesh is heir to, with '—Pills' above and 'Cures 'em all, Sure,' below. A somewhat less sweeping measure, and a somewhat smaller claim for such measure would have more appearance of common sense, than a book full of poetry and intensesness; in fact, a book which is simply one long peroration, with the introduction and the argument promised for some future occasion."

THEODORE P. PERKINS, Lynn, Mass.

"Land value in city and country alike is made by the landed and the landless alike in proportions impossible to determine. That is why 'land owners,' so-called, have no right to take money for it from other men. That is why all the money, men are willing to pay for the use of land, apart from improvements, should go into the public treasury to pay public expenses. As to the abolition of poverty, that is a side-issue. The land reform rests on simple justice, like the other anti-slavery movement. We claim, however, that the chief cause of poverty is legalized robbery, and that the legalized robbery which results from private ownership of land is the most disastrous. We claim that the free conditions resulting from the abolition of our iniquitous taxes and the collection of land-rent by the community will have a very strong tendency to make poverty needless and disgraceful."

C. J. BUELL, Minneapolis, Minn.

"How would it have been with Tom under the single tax? He would have been at liberty to take up any piece of government land he chose, regardless of the amount, without paying anything per acre. He moved on and went to work, no taxes to pay whatever. The first year he broke up *sixty-five* acres, for he had sev-

enty-five dollars more to pay for breaking, as he didn't have to pay that for his land. He raised a bigger crop and made a larger profit. Then he built a better house and barn and put up better fences for he had more means to do it with. The next year he had his entire tract under cultivation, and raised a good crop which found a ready sale at a good price. In exchange he obtained much valuable machinery, furniture, food, clothing, and other things that he and his family needed. He has not yet been visited by the tax assessor and may not be for some years to come. Why not? For the simple reason that he has nothing which the assessor under the single tax has any right to levy a tax upon."

"P." Chicago, Ill.

"In fact, while looking so intently at the little quarter section of land owned by Clark, Wheelbarrow utterly failed to notice the hundreds of unimproved quarter sections owned by speculators and lying, some of them quite near to Clark. Now, I suppose that adjoining Clark's quarter section there was or still is an entire section of land that is held by a resident of some eastern city simply as a speculation. Meanwhile farmers continue to move westward. Why? Is it because there is not enough good land at home? Oh, no! There are in Tom Clark's own county a few thousand untilled acres of as fine soil as ever yielded to the plow. Why is it not cultivated? Because it is controlled by speculators who expect to become wealthy without bestowing honest toil upon it. If Wheelbarrow objects to a tax on farm labor, let him consider the tax that is daily and hourly levied on the farm laborer in the shape of an exorbitant price on farm lands. Wheelbarrow is a good practical joker, but a poor thinker on economic subjects. He should confine himself strictly to handling his one wheeled vehicle."

From a Farmer, (CHARLES M—) Mill Green, Md.

"Although, as C. A. Green rightly says, land in the east can be bought for about what it cost to clear it, yet I will admit that *all* land is originally worth *something*. But it is true, even if single tax men cannot see it, that there *are* improvements that become so incorporated with the original value of land that it *cannot* be separated. Attention! This is the keystone to my objection. Most other objections are small, being only natural conservatism. I will try to make my meaning plain to my city friends by an illustration. A man buys a sloping and rocky town lot. He removes rocks and transports dirt, making a first-class building-site worth double its original value. Years pass, the single tax becomes a law. This man is taxed full rental value because it is then simply impossible to estimate its original value. All this is simplicity itself compared with what goes on at the farm. *W/2* have stumps, stones, and, worst of all, rocks in abundance which also cost in 'abundance' to be removed. If your correspondents express the 'George Theory,' it is a great deal worse than I thought. Friends of the single tax had better stop explaining. Mr. McGill puts the matter very smoothly, sympathizing with farmers, and he says, 'Working farmers like Tom Clark would be benefited.' Beg pardon, but I cannot see it. Farmers would have to pay *nearly all* the tax, for it cannot be truly denied that farmers own most all the best land, and considering its original value, one acre of it is worth, on the average, nearly as much as one acre of city land; for man's gregarious habits made the city land worth so much, and Mr. McGill strongly protests against taxing this. Then remove the protective tariff, making more direct taxation. Verily, would not farming be driven to the wall? Statistics say that farmers wages average eighty-two cents a day; do you want to lower them? If you show no mercy, none shall be shown you. This is natural law. Yet, if given time, this state of things would right itself, but single tax men would, if they could, force it on us all at once: for witness read back numbers of the 'Twentieth Century.' In the light of these remarks, is it not significant that nearly all single tax men are from the large cities?"

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXIV.—Continued.

Ilse stood silent and motionless; Mrs. Rollmaus continuing her comforting words, but Ilse scarcely seeming conscious of them.

It is not safe, Ilse, to teach young princes to use agricultural machines, and to fight duels; the tuition fee will be paid you doubly, and in new coin, as is the custom of the courts.

There was a long and uneasy silence in the room. Ilse looked wildly about; then she took a cane chair, and placed herself opposite to Mrs. Rollmaus, and her fingers flew over her work. "Do not let us talk any more of such calumnies," she said. "What is your son Karl doing? are you satisfied with his progress? and how does he get on with the pianoforte? It would be a good thing for him to understand something about music."

Mrs. Rollmaus recovered her spirits talking over the dances that her son Karl played; she chattered on, and Ilse listened silently, counting over the stitches in her colored wool-work.

The Professor returned, and shortly after the carriage drove up. Mrs. Rollmaus disappeared into the next room to pack up her cap in the band-box, and then took an eloquent leave of her dear friend, the Professor. Her last words to Ilse were:

"It may be long before we meet again; preserve your friendship for me even though I am far from you."

"What is the meaning of these solemn words of parting our neighbor has spoken?" asked the Professor, astonished.

"They mean that we are in a house, to be within the walls of which fills an honest woman with horror and dread," answered Ilse, with flashing eyes; "and they mean that I wish to go away from here, and that it is time for you to take away your wife from unwholesome surroundings."

She told him breathlessly what Mrs. Rollmaus had related, and what the beggar-woman had suggested.

"I am ensnared, Felix," she exclaimed, "by my own fault, I am sorry to say. God knows that in my conduct towards the young Prince I had no thought of bringing your wife into disrepute, but I have been imprudent, and I am suffering for it horribly, horribly! Now I understand the forebodings which have tormented me for weeks past. If you love me take me away quickly from here, the ground burns beneath my feet."

A sharp pang seized the Professor as he saw his wife struggling with agony, bitter enough to stun the strongest soul of woman, and to crush the noblest powers for years.

* Translation copyrighted.

"It is as repugnant and humiliating to me as to you to look openly upon wickedness. I am ready to do all that I can to deliver you from this trouble. Let us calmly consider how this can be done. You cannot, in such a state of passionate feeling, decide what would be good for you, for your judgment is not unbiassed enough to choose your own course. To what old house that a tenant rents or a landlord opens, do not painful recollections attach? Even he who lives a simple life in a strange neighborhood, cannot escape the attacks of idle gossip. Turn away your thoughts from that common woman. It would not become either you or me to depart like fugitives on her account. What have we done, Ilse, to lose our self-respect? There is only one wise method of dealing with the evil work of foolish and perverse accidents, to go forward firmly and to care little for it. Then the dissonance will pass away and perish of itself in the noise of daily life. Those who allow themselves to be disturbed by it, increase it by their own sorrow. Suppose that we were suddenly to leave this house, you would carry away with you the feeling of having left like one who had been conquered, and you would be incessantly pursued by the consciousness of a discordant murmur behind us which would not be silenced."

"You speak coldly and wisely," exclaimed Ilse, deeply incensed; "in spite of what you say, though, you little feel the injury your wife suffers."

"If you now had the self-possession for which I always admired you, you would not allow such unjust complaints to pass your lips," replied her husband, gloomily. "You must know that if I saw you in danger, I would this very hour take you away. Must I now waste words with you to tell you that. But even against the gossip of the weak, this residence is the best defense, for the Prince is away and you remain behind with your husband."

"I know the cause of this indifference," murmured Ilse.

"You know what binds me here," exclaimed the Professor, "and if you were to me what you ought to be, the sharer of my hopes, and if you had the same feeling for the value of the treasure which I seek, you would, like me, feel that I should not needlessly turn away. Bear with this residence, dear Ilse, however irksome it may appear to you," he continued encouragingly, "the longest period is past. I am invited to pursue my quest in the country-chateau of the Princess; there I anticipate that I shall find what will set us free."

"Do not go," exclaimed Ilse, approaching him; "do not leave me in this dreadful insecurity, in a terror that makes me shudder at myself and every strange sound that I hear in these rooms."

"Terror," exclaimed the Professor, displeased, "terror of spirits. Rarely is life among strangers so easy and comfortable as this residence is to us; there may be discord everywhere, and it is our own fault if we allow it to master us."

"Do not go," cried Ilse again. "Yes, there are spirits that pursue me, they hang day and night above my head. Do not go, Felix," she exclaimed, raising her hand; "it is not the manuscript alone that allures you, but the woman who awaits you there. This I have known ever since the first day we came to this town. I see how the magic of her superficial soul ensnares you. I have until to-day struggled against this fear, from the confidence I had in my loved husband. If you go now, Felix, when I would like to cling to you, when I seek every moment for comfort from your voice, I shall begin to doubt you and to have the fearful thought that my trouble is indifferent to you, because you have become cold to me."

"What are you thinking of, Ilse?" cried the scholar, horrified; "is it my wife that speaks thus? when have I ever concealed my feelings from you? and can you not read in my soul as in an open book? Then, was it this that lay so heavy on your mind? Just what I should not have considered possible," he said, frankly and sorrowfully.

"No, no," cried Ilse, beside herself; "I am unjust, I know it; do not attend to my words. I trust you; I cling to you. Oh! Felix, I should be driven to despair if this support breaks under me."

She threw her arms around his neck, and sobbed. Her husband embraced her, and tears came into his eyes as the grief of his wife.

"Remain with me, my Felix," continued Ilse, weeping. "Do not leave me alone just now. I have still a childish, simple heart. Have patience with me. I have been ill at ease here; I do not know why. I cling to you, and I tremble lest you should be alienated from me. I know that you are mine, and I struggle with the fearful foreboding that I shall lose you here. When you go out of the house, it seems to me as if I must take an eternal farewell, and when you return, I look doubtfully at you, as if you had changed towards me in a few hours. I am unhappy, Felix, and unhappiness makes one distrustful. I have become weak and faint-hearted, and I am afraid of telling you, because I fear that you will on that account have less respect for me. Remain here, my beloved; do not go to the Princess—at least, not to-morrow."

"If not to-morrow," he said, cheerfully, "then the next day, or some other day. I cannot forego this short journey. To give it up would be a wrong that we must not take upon ourselves. The longer I delay, Ilse, the longer you will be kept within these walls.

Even from your point of view, is it not prudent to do quickly what would make us free?"

Ilse released herself from his embrace.

"You speak sensibly at a moment when I had hoped for a far different tone from your heart," she said quietly. "I know, Felix, that you do not wish to give me pain, and I hope that you are true in what you now say, and conceal nothing from me. But I feel in the depths of my heart a long-accustomed pang that has often come over me in sorrowful days since I have known you. You think differently from what I do, and you feel differently in many things. The individual and his sufferings signify little to you in comparison to the great thoughts that you carry about with you. You stand on a height, in a clear atmosphere, and have no sympathy with the anguish and trouble in the valley at your feet. Clear is the air, but cold, and a chill seizes me, when I see it."

"It is the nature of a man," said the Professor, more deeply moved by the restrained grief of his wife than by her loud complaints.

"No," answered Ilse, gazing fixedly before her, "it is only the nature of a scholar."

In the night, when the scholar had been long sleeping, his wife rose by his side and gazed, in the subdued light, on the countenance of her loved husband. She got up, and held the night-lamp so that the yellow light fell on his peaceful countenance, and large tears dropped from her eyes on his head. Then she placed herself before him, wringing her hands, and striving to restrain the weeping and convulsions which shook her body.

CHAPTER XXXV.

IN THE PRINCESS'S TOWER.

WHEN the Princess, at the urgent desire of her father, had returned to her home, the illustrious family whose name she now bore made it a condition, not only that she should pass some months of the year at the residence of her deceased husband, but that she should have a special establishment arranged for her in her father's capital. A compact to this effect was concluded, the object of which was undoubtedly to secure to the young Princess a certain degree of independence. In order to fulfil the agreement in appearance, a princely castle in the country was assigned to the Princess for a dwelling, as there was no suitable building in the capital. The castle was half a day's journey from the city, at the foot of a woody hill, surrounded by fields and villages—a pleasant summer residence. The Princess had already spent some of the months of her mourning there.

It was a warm day on which the Professor set off to go to the castle. The air had not yet become cool after the storm of the night. There were fleeting

shadows and bright sunshine on the sky and earth; the thick clouds sometimes cast a grey covering over the straight road along which the learned man passed; but then again it lay before him like a golden path, leading to the longed-for goal.

Thus did dazzling light and dark shadows flit through the soul of our scholar. "The manuscript will be found; it is concealed from us," he said to himself, and his brow became clouded. "If it should not be found, many will read with astonishment how deceptive appearances were, how near the possibility. Many will with regret resign the hope which the words of the monk had inspired, yet none will feel this regret so much as I shall. A thought which has for years occupied my fancy, and directed my eyes to one object, has gained the mastery over me. The free mind of man plays with the thousand impressions of ancient and modern times: he restrains their power by the balance of his reason and strength of his will. But with me a small image of the faded characters of an old book has penetrated so deeply into my soul that the hope of obtaining it makes the blood course through my veins, and the fear of losing it paralyzes my energies. I know that my eagerness is too great; it has hardened me against the childish anguish of my wife, and I myself have not become stronger since I have trodden the uncertain path of the poacher. Every one should be on his guard lest his dreams should diminish the sovereignty of his mind. Even the dreams of the best hours, when a soul innocently devotes itself to a great feeling, may turn a man away from the straight path of duty, that lies nearest to him."

A golden light broke over his countenance. "But if it is found! It is only a small portion of our knowledge of ancient times that lies concealed in it. And yet it is just this discovery that would pour a flood of light upon a landscape hovering in twilight, and several decades of ancient life would become visible to our eyes with as distinct an outline as if they lay in a nearer past. The discovery would solve a hundred doubts, and excite a thousand new ones. Every later generation would rejoice in the great gain, and would seek, with revived energy, for new disclosures. Even for her, who at the castle shares so warm-heartedly in my anxieties, I wish the pleasure of this discovery. To her also it would be forever a great remembrance, that she had taken a kindly interest in the first labors of the searcher."

Higher rose the mountains and more brilliant became the coloring of their masses. The line of hills in the foreground stood forth from the misty distance; blue glimpses of the valley were visible through the openings of the dark wood. The carriage rolled through a well-preserved forest; a thick growth of firs and pines shut out the prospect for a time; when

the road led again into the open country, through grassy meadows and groups of trees, the castle lay straight before the eyes of the scholar. A massive, old-fashioned tower crowned with pinnacles rose out of a low wood; the afternoon sun shone above, its rays forming long streaks in the vaporous atmosphere. The brown walls stood out in the lonely landscape, like the last pillar of a gigantic ruined castle; only by the fresh-looking stone mullions of the well-fitted windows did one perceive that it was a habitable abode. Adjoining the tower rose the small chateau, with steeply-sloped roof and pointed windows; in its moderate dimensions it formed a strange contrast to its massive companion; but in spite of the disproportion of the parts the whole formed a stately relic of the middle ages. One could well see that its walls had afforded shelter and defense to many generations.

The tendrils of the wild vine twined up to the roof of the house and round the windows of the tower, which rose in seven stories, supported by strong buttresses. Thyme and grass grew above in the crevices of the crumbling stone, but the grass which a few days ago had covered the ground had been pulled up and the court and doors festively adorned for the new occupants. Banks of flowers and plants in pots were placed around in profusion. There was only one corner in which the hasty work had not been finished, and the remains of mossy green on the ground, and a swarm of blackbirds that fluttered round the tower, showed that the building had stood uninhabited in a lonely country.

The Professor sprang from the carriage, the Marshal greeted him from the balustrade, and led him into the unpretentious guest-chamber. Shortly after he conducted him through a vaulted passage of the castle to the tower. The Princess, who had just returned from a wall, was standing, with her summer hat in her hand, at the entrance of the tower.

"Welcome to my Solitude," she said; "happy be the hour in which this old mansion opens its doors to you. Here you stand at the entrance of my realm. I have made myself at home in almost every part of the tower; it is our female fortress. When these solid oak doors are closed we ladies can find an Amazonian kingdom, and without danger fire fir-cones upon the whole male world, for this is the fruit that flourishes best here. Come, Mr. Werner, I will take you to the place where your thoughts linger more willingly than with children of the present."

A winding stone staircase connected the stories of the tower, each of which contained rooms and closets; the highest was a loft. The Princess pointed mysteriously to the staircase.

(To be continued.)

A CENTENNIAL PRAYER.

BY LOUIS BELROSE, JR.

O THOU, beneath whose valiant hand
The conquest spreads from land to land,
"Till earth's extremest ends record
Thy victory and own thee lord ;
Thou in whose image gods were fair,
To thee, O man, I raise my prayer !

A hundred years of eager toil
Has turned our wheels and tilled our soil
Since, faithful to their proud decree,
Our fathers made us one and free,
And now we bid the world behold
Our wealth increased a hundred fold.

May memory of the sterner days
When virtue took the place and praise,
Make clear the truth that wealth, apart,
But swells the purse to shrink the heart ;
And leave us like our fathers, strong
To love the right and hate the wrong.

While science with her dawning light
Makes dim the guiding star of night,
And baffled by the break of day
Bewildered millions seek the way,
O keep us on the course begun,
And haste the rising of the sun !

Build us an altar, rock on rock,
Whose time-defying strength shall mock
The winds and floods of doubt, 'till all
Have spent their weary force and fall :
An altar where the true may bring
The true heart's wealth in offering.

Beneath a single flag unite
The scattered bands that waste their might
Against the leagued hosts of vice,
In unavailing sacrifice :
" And, cast in some " more human " mould,
Let the new cycle shame the old ! " *

THE MOTTO ON OUR COINS.

BY LOUIS BELROSE, JR.

*To those by whose influence the Motto, " IN GOD WE TRUST," was put upon the
coins of the United States.*

Is there no shame that thus ye dare disgrace
The fleeting winter of a poor old god ?
That thus ye filch his venerable name
To deck your idol and to cover o'er
Your bestial rites with stale hypocrisy ?
Or has the die, less brazen than yourselves,
Altered your motto, and refused to stamp
" The God we Trust " upon the yielding gold ?

And yet are days not distant when the thought
Of him ye now blaspheme had made you quake
And half forget your plotting in your fear.
But oh, how dimly burns thy smouldering hell !
Poor shadow of a great divinity.
Where is the terror of the mighty hand

Whose infant strength could strangle Hercules,
And shake the lofty throne of thundering Jove ?
Didst thou not bend before thy holy sign
The rabble hordes and yoke their fiery lust ?
Did not thy vicar reign upon the earth
Above the kings ? and make them fear thy wrath
More than the wrath of all their enemies ?
Were not thy altars laden with the deeds
Of fairest virtue and of foulest crime,
While men in every act, or great, or small,
Besought thy help, thy sanction, or thy grace ?
Yea, and though all thy ancestors were dead,
Did they not give thee immortality ?

Alas ! O god, how time has mocked and marred
And wasted thee ! that what is vile should dare
To prostitute thy name, and what is best
Should blush to see the years upon thy brow,
And like a worn jade turn thee out to die
In the lean pastures of the Incognoscible.

How sad a thing it is that when a god
Grows old, as all have done and ever must,
He cannot leave the government of earth
In younger hands, and quietly retire
To some secluded region, far away
From all the strife and tumult of the world.
Thus would the many weaknesses of age
Go unremarked, and thus his waning days
Be peaceful, and his memory remain
Forever cherished in the hearts of men.
But no ; when once his prime is reached and passed,
And each new year brings new infirmities,
His priests begin to tremble lest the herds
They govern in his name should lift their eyes
And mark the dotage of their deity.
The fear that made them valiant in his youth
To work his will is then gone out of them,
And they who served him, then would make his age
The servant of their dear ascendancy.

At first a little fard is judged enough
To hide time's ravage from the vulgar gaze,
But when the faltering step and sightless eye
Foretell the dissolution that must end
Their bloated reign, oh, then begins a farce
To make the heart of honor bleed with shame.
Haggard and wan, but tricked for public show
In hues fantastic like a mountebank,
The god is tortured, and when all his shape
In palsied antics writhes, the priests cry out
" Behold the wondrous power of the Lord ! "
And many who would worship but have eyes.
Seeing these things, forget the glorious past
To scoff, and mock their long credulity.
And so till all have left bim but the blind
And those who lead the blind—and then he dies.
VERSAILLES, 1873.

NOTES.

Symphatizer's rejoinder to Wheelbarrow's answer will appear
in No. 88 of THE OPEN COURT.

Mr. Louis Belrose, Jr., of Washington, is a follower of
Auguste Comte in his first period. The two poems published in
this number may be considered as a poetical expression of his
philosophy. We beg to differ from him concerning the idea of
God and have attempted to conceive it on the basis of positive facts.

* JOHN G. WHITTIER, " Centennial Hymn."

Who wish to preserve the numbers of THE OPEN COURT for binding, may have them mailed weekly in a paper tube at the additional cost of 50 cents a year. In this way they will reach their destination unsold and increased.

TWENTIETH CENTURY

*Devoted to Secular Religion and
Social Regeneration.*

HUGH O. PENTECOST, Editor.

Contains, besides crisp and pointed editorials and contributions from a corps of able writers, the Sunday Addresses of the Editor before Unity Congregation.

It is the only so-called "Liberal" paper that advocates radical social regeneration.

Its columns are open to the absolutely free discussion of all religious and economic theories.

Twelve pages. Issued weekly. Annual subscription, one dollar. Sample Copies free. All subscribers will receive a Copy of Mr. Pentecost's book, "WHAT I BELIEVE."

Address:

Twentieth Century Publishing Company,
No. 4 Warren st., NEW YORK CITY.

Three Introductory Lectures

—on—

The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

Neatly Bound in Cloth. Price, 75 Cts.

NOTICES.

"The lectures are very suggestive, and I think his positions are generally well taken."—*Rev. H. W. Thomas, of Chicago.*

"The absurdity of the theory is manifest."—*New York Science.*

"These lectures are worthy of Max Müller as a philologist and a thinker—full of instruction and philosophic suggestion."—*Prof. Theodore W. Hunt, of Princeton College.*

"The Week, one of the ablest papers on the continent."—*Descriptive America.*

ENLARGED AND IMPROVED.

"THE WEEK,"

A Canadian Journal of Politics, Literature, Science, and Art.

Published every Friday. \$3.00 per year.
\$1.00 for Four Months.

THE WEEK has entered on its SIXTH year of publication, greatly enlarged and improved in every respect, rendering it still more worthy the cordial support of every one interested in the maintenance of a first-class literary journal.

The independence in politics and criticism which has characterized THE WEEK ever since its first issue will be rigidly maintained; and increasing efforts will be made to improve its literary character and increase its attractiveness as a journal for the cultured home. Many new and able writers are now, or have promised to become, contributors to its columns; and the constant aim of the Publisher will be to make THE WEEK fully equal to the best literary journals in Britain and the United States.

As heretofore, PROF. GOLDWIN SMITH will, from time to time, contribute articles. London, Paris, Washington, and Montreal letters from correspondents will be made to appear at regular intervals. Special Ottawa Letters will appear during the sessions of Parliament.

THE WEEK in its enlarged form will be the same size as "Harper's Weekly," and the largest paper of its class on the continent.

Send for Free Sample Copy.

5 Jordan Street, Toronto, Canada.

THE TEACHER'S OUTLOOK.

Published by The Teacher's Publishing Company, Des Moines, Iowa. A monthly magazine devoted to the interests of teachers and advanced pupils and intended to supplement the good work done by other school journals rather than to occupy the same field. Instead of filling its columns with school methods, school aids, and the details of school work, it will aim to interest the teachers in matters outside of the atmosphere of the school room, and its columns will furnish an OUTLOOK upon affairs of life, facts in science and nature which illustrate and test the theories of the schools. In this work it will hope to furnish the teacher with a natural source of inspiration and mental energy, quicken thought and make the school room a place joyous with buoyant spirits that offer a responsive greeting to the inquiring minds of youth, rather than heavy with that gloom and dullness which often surrounds the daily toil.

A leading feature of the magazine will be a monthly review of current events, civil and industrial problems, scientific inventions, discoveries, etc.

Another feature will be a very complete Review of current Literature, especially of all books and magazines coming within the sphere of its labor. We have entered into arrangements with all the leading publishers to keep us informed of all their new and prospective publications, and the Reviews will be made by competent critics.

Still another feature, and a very important one as giving a practical value to the OUTLOOK offered, will be the formation of a circle of writers out of its subscribers, from which it hopes to draw its corps of contributors. This plan is original as applied to a magazine, and is based on the idea of co-operation, or mutual helpfulness. If met with that appreciation necessary to its full execution it will be the means of introducing many new writers to the public, and of aiding many who now lack the training in the expression of thought necessary to a kindly reception in the field of literature into which their tastes would lead them. For further particulars send four cents for Prospectus, or fifty cents for magazine eight months. 112

WANTED!

An energetic and educated person wanted in every town, city, and district, to canvass for subscriptions to THE OPEN COURT, liberal compensation. Address, with references,

PUBLICATIONS OF "THE OPEN COURT."

DREAMS, SLEEP, and ✦ ✦ CONSCIOUSNESS.

By GEORGE M. GOULD, M. D.

PRICE 15 CENTS.

The researches of Dr. Gould upon the nature of consciousness, as studied from the facts of sleep and dreams, are highly interesting, not only as affording suggestions of scientific value, but as exhibiting marks of an exact and cultivated introspective talent.

The Idea of God.

By Dr. PAUL CARUS.

PRICE 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing:

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Entheism, the Monistic Conception of God.

THE MARRIAGE PROBLEM.

By E. D. COPE, Ph.D.

PRICE 15 CENTS.

A scientific discussion, from a practical standpoint, of a question now engrossing the public attention. Prof. Cope's propositions have evoked much comment and criticism.

NEW PUBLICATION.

THE

Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects:

1. The Psychology of the Cell—Introductory.
2. The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.
3. The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition: Predatory Habits of Certain Animalcula.
4. Colonies of Unicellular Organisms.
5. Pecundation of Proto-Organisms.
6. Pecundation of Higher Animals and Plants.
7. The Physiological Function of the Nucleus.
8. Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instance, apart from the author's original investigations, the researches of Balbiani, Czaparide and Lachmann, Nauyas, Ribot, Haeckel, Engelmann, Espinas, Pouchet, Weber, Pfeffer, Kent, Dujardin, Gruber, Nussbaum, Bitschli, Lieberkühn.

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Dr. G. J. Romanes, that the first appearance of the various physical and intellectual faculties is assignable to different stages in the scale of zoological development.

Review of Recent Work of THE OPEN COURT. PSYCHOLOGY AND PHILOSOPHY.

- SENSATION AND THE OUTER WORLD...A. BINET...No. 83. IDEALISM AND REALISM. EDITOR.....No. 84. DREAMS, SLEEP AND CONSCIOUSNESS.

M. Binet, after having animadverted upon the impropriety of excluding metaphysical questions from the domain of science, proceeds in the above-mentioned essay to discuss the interesting question of the relation between human sensation and its normal excitant, the external world. No resemblance is predicable, maintains M. Binet, between the perceptions of consciousness and the bodies that exist beyond us. Doctrines enunciating such resemblance, the author declares fallacious, and terms them "crude and naive realisms." This fallacy, however, is widely prevalent in science. Physicists and philosophers still hold that the definitive explanation of natural phenomena is a mechanical explanation, wherein the concepts of mass and force are the ultimate and fundamental data. They fail to recognize, in this, the purely subjective character of sensations. They translate, merely, sensations of one kind into sensations of another kind, which seem to us more precise; thus, they explain the phenomenon of sound by the phenomenon of a vibration; merely substituting, thereby, a visual sensation for an auditory sensation. This leads the author to discuss the supreme importance of the visual sense in the investigation of phenomena; the possibility of a purely auricular science is held forth; the author shows that the ear, by noting the qualities of sound, can solve numerical problems. Thus, the progression of human knowledge is accompanied by a progression of human capabilities. The future will transform our sciences; it may transform our senses.

Sensation and the phenomena of the external world, it is granted, are different. But does it follow that knowledge of external objects is therefore impossible? The electrical phenomenon traversing the wire of a telephone bears no resemblance to the spoken words thrown against the mouth-piece in the shape of air-waves; no more so than does sensation the external object. Yet is communication by means of a telephone impossible? Are not the spoken words reproduced at the other end of the line in substantially the form in which they were received? Preservation of form is all that is necessary; and this is possible even where there is no superficial resemblance. It is a contradiction to demand that knowledge should be other than it is. Cognition does not, and need not, go beyond sensation.

In Numbers 82 and 83 two interesting letters appear, discussing questions raised by the articles of Dr. G. M. Gould upon Dreams, Sleep, and Consciousness—practical studies upon the psychology of consciousness.

ETHICS AND SCIENCE.

ETHICAL EVOLUTION. PROF. E. D. COPE.....No. 82.

The utilitarian theory of morals, says the distinguished author has found in the law of evolution a permanent substantiation. Yet does that doctrine embrace the whole truth, does it embody exclusively the law of human ethical progress? Ethical conduct, it is true, is an outgrowth of natural mental constitution; it differs among individuals, among families, among races; physical necessities, and conditions of environment direct it. But the knowledge of right is an intellectual faculty. Ethical life expresses, further, the highest development of humanity. Accordingly, moral conduct has various phrases of evolution: the rational as well as the natural, the individual as well as the social; to which corresponding motives of utility, egoism, and altruism belong. We find these motives interacting, each predominant in their respective spheres. The rational element has found its expression in generalization, in the formation by far seeing men of ethical codes; the affectional element, the element of Love, has found its expression in beneficent altruism, wherein the filial relation to God forms an abiding motive to action. The faculty of reason and the sentiment of love ensure ethical perfection.

PASSIONS AND MANIAS. FELIX L. OSWALD, M.D. Nos. 81, 84.

Interesting essays in moral physiology, abounding in citations from history and science in support of the positions taken.

NEWS ABOUT THE PLANETS AND THE MOON.....No. 80.

This constitutes a survey of the latest astronomical observations. It includes a brief account of the canals on the surface of Mars, with their various attendant phenomena; the rotation of Jupiter; the temperature of the moon; and the strange light-phenomena recently observed in the neighborhood of Saturn.

SOCIOLOGY AND ECONOMICS.

HENRY GEORGE AND LAND TAXATION. WHEEL-BARROW.....No. 73

CORRESPONDENCE UPON THE DOCTRINE OF HENRY GEORGE.....Nos. 79, 80, 82, 84.

The criticisms by Wheelbarrow, touching the doctrines of Henry George, have evoked much comment and discussion. The main bulk of the correspondence relative to this question, remains still unpublished; showing the wide-spread interest taken in the subject, and the undoubted popularity of Mr. George's theories. The main endeavor of our correspondents seems directed towards demonstrating Wheelbarrows ignorance and misunderstanding of the great economist's position. This Wheelbarrow seeks to refute in a letter in No. 82.

HISTORICAL AND CRITICAL.

THE DILEMMA OF DOUBLE ALLEGIANCE. GEN. M. M. TRUMBULL.....No. 81.

The article by Gen. Trumbull is opportune. Its tone and position is commendable. Amid the chauvinistic fanfaronade of demagogic statesmen and bellicose newspapers, evoked by petty irritations over Samoa coal-stations and bait for cod-fish, the thoughtful citizen of foreign birth must often feel the appalling meaning that the problem of double allegiance embodies. "What is the ethics of patriotism that must guide us in case of actual war?" "The duty of men embarrassed by the ties of double allegiance," says Gen. Trumbull, "is to stand bravely by the republic whatever comes, but they ought to unite their moral and political influence to promote the settlement of all international disputes by peaceful arbitration." The question has excited much comment from the press throughout the country.

MAKING BREAD CHEAP.

A REJOINDER TO WHEELBARROW ON MAKING BREAD DEAR.
BY SYMPATHIZER.

WHEELBARROW complains in his last essay about the small inheritance of wealth or reward which he receives from the increased productivity of society as a whole. He demands higher wages.

Space will not permit any thorough consideration of Wheelbarrow's complaint, but, adopting his comparisons and figures, may not the following suggestions go part-way towards explaining the small share which comes to him, as an individual? He has supposed, and seems to approve as reasonable, a certain relative value in industries. Thus wheelbarrows as a class, he says, are entitled to one part in the industrial product, jackplanes two parts, the plough four parts, etc. Now he supposes that in twenty years the product of them all has doubled. Shall the farmer's part now be eight, the jackplane's four, and the wheelbarrow's still only one?

Accepting his formula, may it not be true that wheelbarrows, as a group, taken altogether, *do* get their portion doubled, as jackplanes as a whole receive their double portion? If this be true, then the division of the share coming to these groups would become equitably divided among the units composing them. If, therefore, the units composing the wheelbarrow group increased in a faster ratio than the units composing the jackplane group, the share to the units in the wheelbarrow group would be relatively less than would fall to the units or individuals composing the jackplane group. If all men were wheelers, there would be no productivity. Neither must the wheelbarrow wing of the great industrial army be too large. Society can afford to that group, as a division, only a certain share.

' In fact, I believe and statistics seem to prove, that the comparative increase seems to favor the lowest class of workers. The unskilled laborer could in former ages scarcely earn his daily bread and in rare cases only provide himself with a home and have a family. He is comparatively best paid in a highly civilized society. Any increase of industrial productivity will benefit all classes, but the least skilled do comparatively profit most of all.

The individuals composing a group or division,

if their share of the allotment be too small, must join some other division, and no motive can be more effective than the desire to gain a larger individual share of the total industrial product. This is, however, only a suggestion. The question is a large one. It deserves serious and continued study.

It is a hopeful sign that modern thought is becoming engaged with it. Let us hope that through the intelligence displayed in Wheelbarrow, and the growing intellectual power evident on every side among workmen, the great questions of our social economics will find at last a just and final solution.

* * *

But let us confine our attention to the main point of our discussion which is the "crime of making bread dear."

It is somewhat anomalous that one who has never owned a bushel of wheat, nor more than one barrel of flour at any one time, should find himself defending speculation in bread-stuffs. But as the probability is that "Wheelbarrow" is in about the same case, we both have the advantage of looking at the subject from a comparatively disinterested standpoint; and I think we both desire to find the truth.

His review of my criticism is keen and searching; but if I may say so, it appears to be a little disingenuous. For instance, my "witness" said: "The speculator buys *hoping* for a rise, or sells *hoping* for a decline." Wheelbarrow thereupon attacks him, and tries to impeach his character. He says:

"Nothing can be more cold-hearted and selfish than such testimony; it springs from the ethics of the pit. Just think of a man wasting his religion in praying for a rise in wheat. This, too, in a prayer sometimes three months long."

Well, I think I ought not to have exposed my witness to this stricture; and perhaps I ought to have stated in specific terms that a speculator rarely prays, and if he does, it is as often that he prays for a decline as for a rise. My witness used the word "hope" it is true, when the word "belief" would have expressed the facts more clearly. Let us say, then, that the speculator buys *believing* that wheat will rise in price, or sells *believing* it will fall in price, and thus save Wheelbarrow from further moral pain.

Again, my "witness" did not defend corners. He first explained them, and then candidly admitted that

they bore to the regular operators of the Board of Trade about the relation that a piratical excursion bears to commerce, or that the hurried raid in the rear of an army bears to the regular movement of a campaign. But Wheelbarrow scolds my witness as a defender of these objectionable, though brief, influences, and this is not quite ingenuous.

Where commerce covers the sea with ships ministering to the needs of man, experience shows that the pirate may, now and again, in ships manned by men, make excursions hostile to commerce; but experience shows also, that these are incidents, and that their total effect is next to nil, and it is a comfort to know that it is so. It is satisfactory, also, to know that "cornerers" are in their nature brief events, incidents to greater movements, and that in the sweep of time their influence is comparatively unimportant.

I am ready to join with Wheelbarrow (abandoning my witness if necessary) in denunciation of the kind of "cornerers" who resemble pirates. But there remain the "cornerers" whose actions my witness likened to that of a hostile raid in the rear of an army. This does not resemble piracy. It is often excusable. It is frequently patriotic and praiseworthy. Wheelbarrow himself says:

"When I demand cheap bread, I do not wish to deprive the farmer, the miller, or the Board of Trade man, or anybody who contributes to its production and distribution, of his deserved reward."

This is just and right, but if Wheelbarrow would study the facts, he would find that there is frequently at work an influence which, if left unchecked, would rob the farmer, if no one else, of his hard earned reward. This influence is the "short seller." Like the poor, he is always with us, though more audacious. An honest *believer* he may be that lower prices will prevail, owing to his belief in increased crops, or a diminishing demand. He will sell for future delivery if anyone will buy. Like an auctioneer, he will offer it down until he finds a buyer.

In former times governments performed the functions of the Board of Trade equalizing the price of grain by establishing storehouses, buying when the price of wheat was low and selling when it was high. They thereby lowered the price of bread in hard and raised it in good times, thus favoring now the farmer and now the consumer. A socialistic government would have to do the same as did the old paternal governments. Whether they would do it as well as the Board of Trade does it now, remains doubtful.

Now, let us suppose a practical case—a case which has more than once had real existence.

A "rich" man on the Board of Trade, performing the function of the benevolent government of former times, discovers that the course of the market has

brought the price of wheat to a point which does not yield to the farmer his "deserved reward," nor such a price as to justify him in future effort to raise wheat on his farm, if the current price were to continue. In the *belief* that such a state of things cannot long continue, this "rich" man buys. Possibly he has a warm sympathy with the poor farmer, whose crop is ready to market: at all events, he buys: he buys largely. Does the price advance? No, it declines. To average his purchase, he doubles his first purchase at the now lower price. Does it then advance? No! it declines. He figures up the extent of his holding. He finds that he has purchased for an early delivery nearly as much as the total stock in our warehouses, but the price is still falling.

He goes upon "change." A score of voices are offering to sell, by the thousands, by the hundreds of thousands of bushels, competing with each other at fractions less in price at every breath. Shall he join that shouting throng, surrender his judgment, sell as best he can, bear his losses the best he may. He will not do so if he begins his name with an "H." He discovers that a planned campaign has been inaugurated by the "bears" to break the market to the lowest point, and by heavy calls on him for margins, compel him to let go his holdings, and sell to them at their own price.

To face such a situation requires nerve and courage of the highest order. If this buyer has it, and can control the capital necessary, he will plan a work similar to that of "a raid in the rear of an enemy." He will buy. He will buy all that is offered. He will control or corner the market. Only thus can he protect himself. If he is successful, he teaches reckless men,—men who have no regard for the farmer's "deserved reward," that there is retribution for their reckless disregard of equity. And I do not hesitate to say that, under the condition I have sketched, his action conduces to the welfare of the country, and herein is patriotic and praiseworthy.

Wheelbarrow asks—and his question possesses a pathetic interest: "What is it that the speculator buys?" And he answers with impressive emotion: "Wheat!"

Will Wheelbarrow allow us to remain calm at all his excitement?

What is it that all buyers and sellers buy and sell? If it is not wheat, it is meat, or fruit, or coal, or tools, or books, or other necessities which men want and use. Every article, be it made of iron or wood, may it serve directly for the production of food or indirectly to the prolongation and amelioration or elevation of life is to some extent "our daily bread." Man does not live upon bread alone, and in a certain sense we all are engaged in producing bread—life-stuff for human

beings—in some form, and who will deny that everybody attempts to sell his part of it as dear as possible? and everybody has a right to do so. Wheelbarrow agrees with me, that if anybody's work is more difficult, he may have greater rewards, and the scale of wages can easily be regulated by free competition.

Wheelbarrow becomes sentimental when he observes that some people deal in wheat, and that they hope for a rise of wheat.

When Wheelbarrow delved and carried earth at a railway job, he undoubtedly added his mite to the general capital and was engaged in making bread cheap, for the road will soon carry farmers and their machines West to raise more wheat. But when Wheelbarrow now demands his wages doubled, his own and of course those of all wheelers of earth too, he prays for making bread dear; for higher wages must increase the expenses of building railroads, and if any disproportionate increase of wages took place on a larger scale, it might prevent roads to be built and thus would necessarily make it impossible for many farmers to go West, and those who live West could not send their wheat East. It would tend to making bread dear.

While upon the whole, Wheelbarrow, as it appears to me, means what is right and just, he has one fault, and that is his rhetoric. What is the use of sentimentality in economical or in any other questions? Let us come to business in plain and clear terms without any verbosity and ado, and we will the quicker understand one another. Making bread cheap in the sense Wheelbarrow preaches, may be well enough, but let us not forget, that in a certain sense, we are entitled to make it dear, just as much as Wheelbarrow is entitled to demand higher wages, if he can get them, or rather—if he deserves them.

When I undertook to oppose Wheelbarrow I chiefly intended to call attention to the fact that there are two aspects of the question of making bread dear. Labor agitators, as a rule, demand that "the bread we eat must be cheap, but for the bread we make we should demand the highest price," and the short-sighted, credulous listeners are apt to believe him who promises most. They do not see that agitators preach "yes and no" in one breath, that sour and sweet at the same time comes out of their mouth.

There is a modern reformer appealing with his arguments to the broad masses, who promises by the simple means of taxing land to its full rental value to offer bread for nothing. Henry George says in "Progress and Poverty," that if but the landlords were taxed out of existence, we would realize the ideal of the communist. We shall have meals at public tables for the mere asking of it, free libraries, free theatres, free baths, free railroads, free street cars,

heat and motor power furnished in our houses at public expense, etc., etc.

What is that else than offering bread gratis? and it is bread for body and soul, bread of any description. But if all that can be had for the mere asking of it, who will then work? "That is just the advantage of it," I am told, "wages will rise, they will rise as high as they never have been, and men will not work at all unless it be for the pleasure of work."

An excellent prospect if it were possible! Pray, gentlemen, how can you, for any length of time, distribute values gratis, unless you can also create them gratis?

Mr. George promises that we shall reap where we did not sow and that we shall have an unlimited credit in the bank of public prosperity without being obliged to make any deposit.

Mr. George has a great followership and whatever be the merit of his idea of land taxation, nobody seems to be aware of the utopian scheme of what constitutes Georgeism proper. He promises that the bread we eat shall be cheap, so cheap that it is given for the mere asking of it, and the bread we make shall be dear, so dear that nobody shall be able to buy it, unless he pays the full price we demand.

Let us cease to be overawed by oratory. There is an untruth in every exaggeration and every untruth contains poison.

Let us work to produce bread, every one in his way; useful work will lead to make bread cheap. But at the same time let us bear in mind that bread means human labor, it means human lives. Any artificial combinations to make bread dear for the benefit of a few conspirators—pirates as I called them—is to be condemned. In that I fully agree with Wheelbarrow. But let us not demand that bread be too cheap, for that would necessarily degrade a certain number of human lives into abject poverty, and deprive them of their due reward for having contributed to make bread.

DREAMS AND VISIONS.*

BY FELIX L. OSWALD, M. D.

It has often been remarked that an explanation of the soul-phenomena known as dreams, would furnish a key to the enigma of the soul itself, and the problem of slumber-visions has, indeed, been a subject of curious speculation since the earliest dawn of philosophy. Aristotle (*De Somno et vigilia*) makes the physiology of sleeping and waking the topic of a special treatise, and like Dr. Abercrombie, seems to assume a distinct organ, if not a sixth sense, for the perception of facts unknowable to the ordinary (waking) mode of cogni-

* Copyrighted under "Body and Mind; or, The Data of Moral Physiology." Part XXIV.

zance. Plutarch and Herodotus quote numerous anecdotes of prophetic night-visions. Pliny, too, examines the subject from a physiological point of view, and the *Oneirocriticon* of Artemidoros is a "dream-book," quite in the modern mystic sense of that term, and abounds with fanciful rules for the interpretation of dreams, of which he distinguishes two kinds: the ordinary allegoric and the directly prophetic ("theoretic," as he calls them) which warn the sleeper by an actual prevision of coming events.

The writings of the mediæval schoolmen teem with similar speculations, and Kieser, Briere, and Abercrombie treat the problem from a highly metaphysical point of view; but the most satisfactory explanations of dream-life have after all been derived from the study of physical analogies. Sleep is a process of restoration and readjustment, and physicians well know that the healing powers of nature assert themselves most effectually during the entire suppression of volitional control characterizing a deep slumber. In dreams, too, the absence of direct sense-impressions and volitional interference seem to favor an automatic function of the brain which, in that respect, might be defined as a method of *mental digestion*. And just as the process of physical digestion and assimilation eliminates the superfluous elements of food, retaining only those needed for the special purposes of the organism, the brain, during sleep, appears to deal specially with topics of direct concern for the personal interests of the sleeper and to assort and adjust the store of empiric impression (the mental *ingesta*, as it were) after eliminating all unessential and unsequential elements. Withal, the suspense of conscious cerebration by no means implies an eclipse of the intellectual faculties. Dreams are not limited to plays of fancy; the brain in slumber may deal with philosophical and abstrusely scientific speculations, or resolve moral doubts which perhaps have puzzled the mind for days, and it is a common experience that the distressing problems of practical life adjust themselves, as it were, in sleep, by a more or less conscious process of the cerebral laboratory.

In short, there is no doubt that *the instinct guarding the welfare of the individual presides over dreams as it presides over the automatic functions of the physical organism*. The very suspension of the will power, with its passions and prejudices, seems, indeed, to enable an inner monitor to decide vexing doubts in accordance with the best permanent interests of the sleeper. It has often been observed that the dramaturgy of slumber represents all actors in a rôle revealing their true character with remarkable correctness, and often with a suggestiveness that has tempted mystics to ascribe that sort of clairvoyance to direct inspiration.

Yet here, too, physical analogies might suggest a simpler explanation. The saving crisis of dangerous diseases which often supervenes in deep slumber may be explained by the circumstance that the complete repose of the volitional faculties enable the organism to concentrate all its energies upon a needed work of repair, and for similar reasons the non-interference of waking prejudices may give the instinct of self-preservation a long desired chance for removing a baneful delusion as to our best interest in a proposed mode of action, or as to the true character of designing fellow-men. Something or other in the looks or the actions of a marked rascal may have suggested a suspicion of his secret motives, though at the time collateral circumstances observed that misgiving, leaving only a vague, unexplained uneasiness as the direct result of such experiences. But in sleep that impression reasserts itself with a force freed from the interference of prejudice, and for a moment removes the mask of false appearances; the sleeper receives a "warning." Similar warnings often correct the impressions of false hope. Impending perils may cast a shadow persistently ignored in a waking state, while the mind is by the influence of a self-deluding optimism—the wish that is father to the belief in the insignificance of the threatening danger. But in sleep the voice of the monitor cannot be silenced by such illusions, and warning forebodings often take the form of distinct visions, repeated with a vividness and frequency which at last cannot fail to influence the actions of the individual, in spite of all waking sophisms. I remember the instance of an American family that had settled in the northern uplands of Cameron County, Texas, but before the end of a year removed to the vicinity of a larger settlement, and sold their half completed home for reasons that remained a mystery to their upland neighbors. "We had selected that building-site after a good deal of prospecting," the first proprietor of that house told me a few years later, "and at first it seemed a puzzle to me that nobody had pre-empted it long ago. It was a broad hill with a fine prospect east and south; we had an abundance of timber, fine range, two good springs, and a ledge of soft limestone within a thousand yards of the house, where you could shape out building-stone with a common saw. I never could hope to find better neighbors; they actually got up a picnic to celebrate our arrival, so glad they were to have English-speaking folks within visiting distance. We had every prospect of getting an improved road and a post office, and three months after our first entry I would not have sold that homestead for ten times my direct expenses. But about half a year after, that ranch seemed a haunted place and I didn't feel at rest day or night though people that know me are not likely to call me superstitious. I never was a afraid of

darkness even when I was a boy and a swarm of ghosts would not scare me worth a cent. But one night, about a week after I had got home from a trip to Brownsville Landing, I dreamt our house was tackled by a gang of Greaser bushwhackers (Mexican bandits) and that they shot me down and killed my little boy with a club, and then loaded their horses with everything they could move. Two nights after I had exactly that same dream over again, and I could see every stick and stone in our yard, when I tried to make a break for our next neighbor and was shot down just as I rushed through the gate. I noticed the very horses and saddles of that gang and could have recognized every one of them if I had met them in daylight, and I now do believe that I did see them somehow or other on that trip to the Landing. The idea began to haunt me when that dream had come back for the third time, though I never said a word; but one morning my wife seemed uneasy till all our farm-hands had started to work, and then asked me to come out in the garden for a minute. "Do you think there are any robbers in this neighborhood?" she asked me when we were quite alone. "Why, did you see or hear anything suspicious?" I asked her back. "No, but I had such a strange dream last night," said she, with a sort of a shudder, "I dreamt a gang of Mexicans came to our house and made me run for my life, and just before I got through the door I saw them knock down little Tommy with a club." "Didn't I help you?" I laughed. "I don't know," she said, "I saw you collar one of them, and I kept calling for you in English to save yourself, but just as you dashed through the gate I heard the crack of a shotgun and then I fainted." I made no reply, but that minute I felt that we couldn't stay no longer, and two weeks after I made up my mind to move to Indianola. There were no Mexicans in our immediate neighborhood at that hill-farm, and no serious robbery had happened anywhere nearer than Casa Blanca, but I felt that I had to look for a new home if I expected to get an hour's peace, and it often seemed to me that I was doing a sin if I let my little boy out of sight for ten minutes. So we made up an excuse about schools and post offices and managed to sell our pretty place for a few hundred. The neighbors thought I must be half crazy, but I couldn't help it; and just ten weeks after we were gone we got the news of that Pancho Parras massacre. The whole neighborhood had been sacked and outraged, and as I know my boy, I am now morally certain that he would have stood his ground and got himself killed, if he had seen any brute lay hands on his mother."

The very homeliness of that account impressed me with a conviction of its absolute truth, and on the whole I consider it the most characteristic instance of

what Artemidoros would have called "theorematic dreams." Moorish chronicles, though, relate that in 726, or nearly five years before the date of the fatal expedition, the Chalif Abderahman had an interview with a hermit who gave him a detailed description of the battle-field of Tours and all the particulars of the disastrous defeat which had been revealed to him in a prophetic dream. The Earl of Stafford, too, is said to have been warned by the dream of his Scotch gardener, who was subject to that sort of second sight, and once told his master that he had seen him in his sleep, addressing a large assembly from the top of a raised platform. "There were three other chiel's standing up alongside of my lord," said the gardener, "one of them looked like a priest but I could not make out the two others." Hibbert's "sketches of the philosophy of apparitions" give a circumstantial account of a vision in which a lady—at that time in the enjoyment of tolerable health—had the day and the very hour of her death revealed by a dream, which she communicated to a few of her intimate friends; and even Goethe in his autobiography (*Dichtung und Wahrheit*, Vol. XI) relates a vision which eight years after was verified on that very spot, and under circumstances which at once recalled the details of that second sight apparition.

Such details are no doubt often suggested by sensory impressions received in a waking state, out of which the mind, pre-occupied by other thoughts, had at the time failed to take special cognizance. Miss Cobbe, in a contribution to *MacMillan's Magazine*, relates a very suggestive instance of that kind from the experience of a British officer, engaged in the pursuit of a gang of Hindoostan bandits. His wife, who accompanied him on that expedition, one morning urgently entreated him to leave his camp in a certain jungle, where she had been "haunted by the sight of dead men." The very next day the officer's skirmishers discovered the traces of a new-made grave, and after removing a shallow stratum of leaves and sand, disinterred not less than fourteen corpses. "It is very conceivable," remarks Miss Cobbe, "that the horrible vision was suggested by the foul odor of death. Had the lady been in a state of mesmeric trance, the same occurrence would, no doubt, be quoted as a splendid instance of supernatural revelation."

An even clearer proof of the sensory source of certain dream-visions is related in Dr. Carpenter's anecdote of a traveling magistrate who, "having been retained, before his elevation to the bench, in a case which was to be tried in the North of England, he slept at the house of one of the parties in it, and dreamt through the night that lizards were crawling over him. He could not imagine what had suggested such an idea to his mind, until, on going into the apartment in

which he had passed the evening, he noticed a mantelpiece clock, on the base of which were figures of crawling lizards. This he must have seen without *noticing* it, and the sight must have left a 'trace' in his brain, though it left no record in his conscious memory."

In the *tableaux vivants* of the sleeping brain, such scenes are often interwoven with those "allegoric visions" which form the large plurality of prophetic dreams, and the main topic of modern and mediæval commentaries, though the most curious instance on record is a tradition of classic antiquity. When the island-king Polycrates was invited to visit the Persian satrap of Sardis, his daughter, as a biographer of the accomplished despot informs us, had a dream in which she saw her father annotated by Apollo and washed by the hands of Jupiter. The horrible significance of that dream was revealed at Sardis when the treacherous satrap had the king crucified in an open field, where the burning sun covered him with sweat, and a thunderstorm with rain.

The *daimon* of Socrates predicted only evil but never happy events; yet monitory dreams, prompted by the ever-active instinct of self-preservation, are by no means limited to "warnings." They occasionally assume the form of *attractive* visions, and I remember the comments of a consumptive, who had contracted his fatal disease by an excess of indoor work, and described the tantalizing dreams which for years tormented him with visions of highland scenes and waving forest-trees. "On awakening in the morning," he said, "I often found my pillow drenched with tears, and there were days when I felt that I could have cheerfully renounced my city comforts and started for the Sierras to share the pot-luck of a hunter's cabin, if the dread of my father's temper had not prevented me. After my lungs had been ruined," he added, with a sigh, "those visions never came back. I fear they had failed to serve their purpose and gave me up for lost."

The popular belief that appealing dreams limit their mission to the prediction of perils, may be explained by the circumstance that the significance of inviting visions is less apt to be strikingly revealed by eventual experience. Warning dreams are forcibly recalled by the supervision of the threatening event, whether or no the warning should have prompted the adoption of timely precautions. Attractive intuitions of dream-life, on the other hand, are apt to be mistaken for prefigurative, rather than monitory visions, and even if they should fail to be heeded, their real purpose may never be suspected, or reveal itself only in the vague longings which transiently haunt our waking hours, like the echo of a distant voice.

SPACE AND TIME.

In his Critique of Pure Reason (Part I, Section I), Kant proposes the question: "What then are time and space? Are they real existences?" And he answers in the negative. He says:

"If we ascribe objective reality to these forms of representation, it becomes impossible to avoid changing every thing into mere appearance. For if we regard space and time as properties, which must be found in objects as things in themselves, as *sine quibus non* of the possibility of their existence, and reflect on the absurdities in which we then find ourselves involved, inasmuch as we are compelled to admit the existence of two infinite things, which are nevertheless not substances, nor any thing really inhering in substances, nay, to admit that they are the necessary conditions of the existence of all things, and moreover, that they must continue to exist, although all existing things were annihilated,—we cannot blame the good Berkeley for degrading bodies to mere illusory appearances. Nay, even our own existence, which would in this case depend upon the self-existent reality of such a mere nonentity as time, would necessarily be changed with it into mere appearance—an absurdity which no one has as yet been guilty of."

Space and time, Kant declares, are nothing else than forms, the one of our external the other of our internal sense. They are not real, they are ideal.

We agree with Kant that space and time are ideal, not real in so far as they are no things, no objects, but abstract conceptions. Space of itself apart from extended, extending or moving things, and time of itself apart from changes do as little exist as matter of itself or force of itself. Space does not extend, but things extend and move; and their extension *is* space. Time does not change but things are changing; their change, or rather the measure of their change, *is* time. Without extended things no space, and without motion or change no time. We disagree from Kant in so far as he says that space and time are the forms of the *thinking subject only*. He denies that they are properties inhering in the objects, because, he maintains, they cannot have been abstracted from reality. If they were abstracted from reality, he argues, mathematics would be an experimental, yet no transcendental, *i. e.* formal, science, and we could never attribute to mathematics absolute validity (rigid necessity and universality). Kant explains his position as follows:

"Those who maintain the absolute reality of time and space, whether as essentially subsisting, or only inhering, as modifications, in things, must find themselves at utter variance with the principles of experience itself. For, if they decide for the first view, and make space and time into substances, this being the side taken by mathematical natural philosophers, they must admit two self-subsisting nonentities, infinite and eternal, which exist (yet without there being any thing real) for the purpose of containing in themselves every thing that is real.

"If they adopt the second view of inherence, which is preferred by some metaphysical natural philosophers, and regard space and time as relations (contiguity in space or succession in time), abstracted from experience, though represented confusedly in this state of separation, they find themselves in that case necessitated to deny the validity of mathematical doctrines *a priori* in

reference to real things (for example, in space),—at all events their apodeictic certainty. For such certainty cannot be found in a *a posteriori* proposition; and the conceptions *a priori* of space and time are, according to this opinion, mere creations of the imagination, having their source really in experience."

From this standpoint Kant concludes:

"I maintain that the properties of space and time, in conformity to which I set both, as the condition of their existence, abide in my mode of intuition, and not in the objects in themselves."

Taking this position that space and time are forms of our cognition merely, not of things, Kant accepts the inevitable consequence that

"The question, 'What are objects considered as things in themselves?', remains unanswerable even after the most thorough examination of the phenomenal world"

If Kant were right in his solution of the problem, the question "How does the constitution of thinking subjects universally, (so far as we can judge), happen to have such forms of space and time as they are," would be unanswerable. Could we not, or at least some of us—of living beings—just as well have a constitution of four-dimensional space? And if so, how would in that case our conception of four dimensional space tally with actual space?

If space inhered, as Kant maintains, in the thinking subject *only*, special relations and laws would appear different to four-dimensional beings. Kepler's third law for instance, that "the squares of the times of revolution of the planets are always proportional to the cubes of their mean distances from the sun," would to them most probably appear as "the cubes of their times of revolution being proportional to their mean distances taken to the fourth power." To us a right-angled solid that measures two inches in each of its dimensions, (*viz.*, a cube) contains eight cubic inches. A four-dimensional being would be sure that a right-angled solid that measures in all its dimensions two inches must necessarily contain sixteen four-dimensional inches. Anybody who denies that such radical changes would take place in the objects of the phenomenal world, must inevitably admit that tridimensionality is not merely our "mode of intuition," but an inherent quality of matter.

If the form of matter is tridimensional it is natural that beings whose bodies are built up of tridimensional matter will be able to ascertain the tridimensionality of their world by experiments of mere inner experience. Taking up space themselves, they can by mere reflexion determine how many dimensions actually exist. Kant does not distinguish such internal experimenting from reasoning *a priori*. Reasoning *a priori* should be strictly limited to pure formal thought, while experiments are and remain a matter of experience whether they are executed on phenomena of the outer world or whether the subject

experiments on or within his own body, which after all, like the rest of things, is an object in the phenomenal world.

If Kant had investigated the problem of the *a priori* (of formal thought), he would have found that the forms of our cognition naturally grow with experience, and that we acquire them indeed by abstraction. Consequently, absolute apriority which Kant attributes to space can not be granted it. Our mathematical laws possess absolute rigidity and universality for tridimensional space and as a system of third degree they are *a priori*, *i. e.*, pure formal thought, but the fact that space is tridimensional is exclusively a matter of experience.

How much of experience enters into our conception of space can be seen from the following logical syllogism:

PREMISSA MAJOR:

The formal laws of a system of third degree apply to any system of third degree with rigidity and universality,

as we know *a priori* (*i. e.*, from pure reason, or formal thought, from inner reflection upon the laws of pure form).

PREMISSA MINOR:

Actual space being tridimensional is a system of third degree,

as we know by experience and can prove by experiment.

ERGO:

The formal laws of third degree apply to space with rigidity and universality.

* * *

KANT, in his argument, identifies 'ideal' and 'subjective.' The conception of space being an abstract idea and its being to some extent formal thought, does not at all compel us to deny that actual space is a real (although by no means a material) property in objects.

Kant says:

"The proposition, "All objects are beside each other in space," is valid only under the limitation that these things are taken as objects of our *sensuous intuition*. But if I join the condition to the conception, and say, 'all things, as external *phenomena*, are beside each other in space,' then the rule is valid universally, and without any limitation.

"Our expositions, consequently, teach the *reality* (*i. e.* the objective validity) of space in regard of all phenomena which can be presented to us externally as objects, and at the same time also the *ideality* of space in regard to objects when they are considered by means of reason as things in themselves, that is, without reference to the constitution of our sensibility. We maintain, therefore, the *empirical ideality* of space in regard to all possible external experience although we must admit its *transcendental ideality*, in other words, that it is nothing, so soon as we withdraw the condition upon which the possibility of all experience depends, and look upon space as something that belongs to things in themselves."

Whether space and time apply to "things in themselves" must be considered from the standpoint of monism as an idle question, since "things in themselves" do not exist.

In contradistinction to Kant's view we maintain: The nature of our cognition is such that space can not but appear tridimensional to us. Our existence is tridimensional, and for that very reason our cognition is tridimensional also. Our existence, however, is a part of the whole of reality and our life is a phenomenon among many other innumerable processes of nature. Consequently we look upon the forms of our existence as upon a specimen, so to speak, of the forms of existence in general.

It does not lie within the scope of our problem to enter into the details of the growth of space-conception. There is but one way for a living being to acquire the idea of space, and that is by motion—not only through the observation of moving bodies, but also and chiefly through self-motion. If we were immovably fixed to one spot, we would have no conception of space or at least a very dim one. Only while moving ourselves, can we measure distances, and by measuring we form our ideas about space. If this is true, and I think it can be proved experimentally, the definition of space as "the possibility of motion in all directions" will be justified. That the different senses having a different kind of motion, will have different measures for space is obvious. The most primitive method of the different senses in judging of distances is the remembrance of the effort necessary to pass through it from one end to the other. Errors are corrected by a comparison among the results of the different senses and may be altogether avoided by the application of a standard measure in which all distances can be expressed.

P. C.

CORRESPONDENCE.

THE SINGLE TAX AND GEORGEISM.

To the Editor of THE OPEN COURT:—

MR. GEORGE made a blunder by going to England and leaving his doctrine loose in the hands of his disciples. They have given it so many emendations and explanations that he will hardly know it when he gets home. If he could read the thirty or forty defenses of it which have appeared in THE OPEN COURT he would laugh at their paradoxical ingenuity. He would exclaim with that Maryland farmer, "Friends of the single tax had better stop explaining."

The most condensed explanation of the single tax doctrine is given by Mr. Hugh O. Pentecost in THE OPEN COURT, No. 85. I will first notice that. He says:

"If Wheelbarrow cannot separate the idea of 'the value of land from the land,' as he confesses, he certainly ought to understand that one piece of land has more renting value than another, and he ought to understand so simple a proposition as having *ground-rent* and nothing else paid into the public treasury. That is all there is to the 'George Theory.'"

Very good! That simplifies the debate. Mr. Pentecost is of high authority as a commentator on the gospel according to

George. If Mr. George left the key to his problem in the hands of any man, he left it in the hands of Mr. Pentecost. I must therefore consider his interpretation orthodox although it is hardly consistent with the original text as written by Mr. George himself. Mr. Pentecost gives us a very narrow definition of Mr. George's claim. Mr. George expands the *ground-rent* project until it includes the confiscation of all the value of all the land. This is practically the confiscation of the land; and the communists of Europe and America understand it so. Mr. George himself understands it so. In proof of this I quote his very words, as I find them on page 302 of "Protection or Free Trade."

"Now it is evident that, in order to take for the use of the community the whole income arising from land, just as effectually as it could be taken by formally appropriating and letting out the land, it is only necessary to abolish, one after another, all other taxes now levied, and to increase the tax on land values till it reaches, as near as may be, the full annual value of the land."^{*}

Can confiscation be declared in plainer words than those? They are copied from Webster's dictionary, where Confiscation is defined as "Appropriating to the public use." Why quibble over words and phrases such as "single tax," "ground rent," "land values," and similar labels on the bottle, when Mr. George declares that the remedy in the bottle will "take for the use of the community the whole income arising from land, just as effectually as it could be taken by formally appropriating and letting out the land?" "It is only *ground-rent*," says Mr. Pentecost, after the manner of Leroy Carter, a comrade of mine, who was arrested for killing a pig. "Did you kill that pig?" said the colonel; "No, sir," said Carter, "I did not. He came smelling around the tent, so I just run my bayonet through him, and he—died." It is only *ground-rent*, but it appropriates the land. We do not propose to kill Tom Clark, we shall only just playfully run him through with a bayonet.

The popularity of Mr. George's theory lies in the extravagant claim he makes for its beneficence. I have been criticized for saying that the millennium is included in his plan. Let us examine his most recent utterance on the subject. A few weeks ago Mr. George wrote a letter to the *Chicago Times*, in which he said:

"The single tax reform is the most pressing. This is the one great reform that by relieving industry of all burdens and preventing the monopolization of the one element necessary to all production and all life will enormously increase production, will secure an equitable distribution of wealth, will solve the labor question, which lies at the root of all our social and religious difficulties, will make Christianity possible, will give the masses of men opportunity for more than a struggle to exist, and will open the way for an advance to a far higher and grander civilization."

If that is not the millennium, what is it? Does Mr. Pentecost believe that such tremendous results are to be obtained by the application to society of the insignificant porous plaster which he calls *ground-rent*? Does he believe that his fly-blister will draw the inflammation from the body-politic, allay the social fever, solve the labor question, and "make Christianity possible"? Is not Christianity possible now? And does it not exist in many different forms? If the full promise of Christianity has not yet been realized, will it come through the diminutive device called *ground-rent*? The towering pretensions of Mr. Henry George are brought by Mr. Pentecost to an anti-climax when he declares that *ground-rent* paid into the public treasury "is all there is to the George Theory." All that is needed now to "make Christianity possible" is a little *ground-rent*.

Mr. George ridicules the protectionists for trying to make people rich by taxing them, yet he attempts the same impossible feat in a tenfold more difficult and exaggerated form. He actually says that a single tax on land values amounting to the "whole income" of the land and its "full annual value" would benefit the farmer. This contradiction is the illusive creed of multitudes, as appears from the letters in THE OPEN COURT.

*The italics are mine.

Let us see how Mr. George's plan would enrich Tom Clark. He would be taxed \$8 or \$10. for his farm according to the Georgian assessor. But some new comers would be willing to pay more for God's bounty and Mr. Clark would be evicted. Those who can separate the land value from the land will perhaps tell him how he can take his improvements along. You declare that Tom Clark may sell his improvements. You can even force him to sell; but you can force nobody to buy them.

I agree that land values may be taxed; but I maintain that they cannot be seized and sold in satisfaction of the taxes, any more than a crack in the wall of a house can be taken in execution for the rent. All taxes upon land values are ideal in their assessment; they are actual and real in their collection. They attach to the realty, the land, and if not paid, the land itself, and not the land value, is sold by the sheriff. Therefore all taxes upon land values are taxes upon land. To assert that they are friendly to the soil itself, is to repeat in a new form the apology for the cut-worm, who merely attacks the wheat, but is careful not to injure the land.

The state of New York *e. g.* must bear a very large burden of taxation, and it is not statesmanship but sentiment which proposes to obtain the money by a tax on land values irrespective of the improvements on the land. According to the ratio of population, the state of New York must pay twenty-seven million dollars annually in taxes to the national government alone, although according to the ratio of wealth the share of that state would greatly exceed that sum. How could the money be raised by a tax on land values alone, in addition to the sums necessary to defray the vast expenses of the State, County, and Township governments? Men live in dreamland who think to benefit the New York farmer by levying all taxes upon land values, and exempting from taxation all the personal property of that opulent state, all the money, bonds, banks, railroads, ships, factories, stocks of goods, and all buildings of every description whatsoever. There is not in all dupedom a more deceitful vision than that of a farmer growing rich by the exemption from taxation of all kinds of property except his own.

I should like to continue but I must stop here to day because it will take me a few days of hard study to answer your Dakota correspondent who can see no moral distinction between stealing horses, and investing capital in land; and that Ohio critic who says that Mr. George is not after Tom Clark, but his children; and that Chicago man who desires to encourage Tom Clark in making improvements on his farm by exempting everybody and everything from taxation except land owners and land values; and that Massachusetts economist who tells us that the abolition of poverty is only a "side issue."

Mr. Pentecost sees no difference between the proportion of land taxation and Georgerism. But I see a difference. While I consider the one feasible, I think that the latter is fantastical.

WHEELBARROW.

BOOK REVIEWS.

PASSE ROSE. *Arthur Sterburne Hardy*. Boston: Houghton, Mifflin & Co.

Mr. Hardy's first attempt in fiction, "But Yet a Woman," published a few years ago was a delight and surprise to all who read it, and gave rise to agreeable expectation concerning his future work. *Passé Rose*, in its *locale* and general plot is a complete contrast to his first work and proves him an accomplished writer of pure romance. A fine poetic sensibility marks all of the characterizations, while the descriptions of the semi-civilized and picturesque life of the age of Robert G. Tans gives an ideal grace and charm to every page.

C. P. W.

We have received from the *Société Royale Malacologique* of Belgium the annual reports for 1887, constituting the twenty-second volume of Series IV (Brussels: P. Weissenbuch). The work opens with a continuation of M. Cossmann's illustrated catalogue of the fossil shells of the Eocene epoch in the environs of Paris; the cuts are appended to the volume. M. Cossmann's *memoire* occupies most of the volume. M. Edgar A. Smith has some remarks upon the terrestrial shells of Sumatra, Java, and Borneo; M. E. Perijens, upon the Bryozoa of the Tasmajdan, at Belgrade. The various catalogues, discussions, and remarks upon malacological subjects embodied in the work, will be of undoubted value to specialists at home.

The Liberal Hymn Book, edited by Eliza Boardman Burnz, (24 Clinton Place, New York) is a small paper-bound volume, easily carried in the vest-pocket. The songs contained in the little book are adapted to popular tunes; they are designated for use in liberal meetings and liberal homes, being as the editress says, "a very effective means for extending the domain of free-thought." The collection comprises some of our most familiar popular hymns, and many selections from Whittier, Tennyson, Longfellow, and others. Apropos of the occurrence of the word God in different passages, the editress defines Him to be man's highest conception of what is noblest and best in the universe or in humanity—"the totality of all Good." The orthography is a slight modification of the system of the American Spelling Reform Association: *a* being omitted from *ea* in such words as *hed*, *helth*; *e* omitted after a short vowel, as in *hav*, *giv*; *f* written for *ph*, as in *fonograf*; *ed* changed to *t*, when it has the sound of *t*, etc.

The Future of Morality as Affected by the Decay of Prevalent Religious Beliefs, is the title of a concise pamphlet of 16 pages, by Mr. M. S. Gilliland (London: Watts & Co.). The author first examines the nature of morality. He finds it to be "a particular kind of conduct, rendered necessary by the nature of man and the conditions of his existence, and made pleasurable by the persistence of that necessity; both necessity and pleasure being appreciable by human faculty, uninstructed by supernatural revelation." Tracing, then, the connection between morality and religion, the latter is found to be the "reflection of the intellect and character of the believers." Morality, thus, is declared to be entirely "independent of religion in its origin, basis, and sanction." We have no cause for anxiety, says the author, as we face the breaking up of creeds, nor should we fear the results of a dis-sociation of morality from religion. Ours must be an earnest endeavor to apprehend the moral order of the universe; and fearless fidelity to the convictions we thus gain.

NOTES.

St. George Mivart, late professor of biology at University College, Kensington, the author of "Genesis of Species," opposes in the *Forum* for May Darwinism and the ethics derived from Darwinism on moral grounds.

The *Century Magazine* for May will contain richly illustrated essays on "Samoa: The Isles of the Navigators," by H. W. Whitacker; on "Our Relations to Samoa," by George H. Bates; on "The Tuscarora's Mission to Samoa," by James T. McKay. Verestchagin's picture of the wailing place of the Jews is published among the illustrations of the article "Round About Jerusalem," by Edward L. Wilson.

The May number of the *Magazine of American History* brings another entertaining chapter of fresh Centennial information, "Washington's Historic Luncheon in Elizabeth," with very unique pictorial attractions. As usual, it is a specimen of typographical beauty—in the artistic elegance of its printing it holds the highest rank in the magazine field, Price, \$5 a year. Published 743 Broadway, New York City.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXV. — Continued.

"Yonder at the top, below the rafters," said the Princess to the Professor, "the whole space is crammed with old household furniture. I could not restrain my curiosity, so yesterday I just peeped into the room; the things lie heaped up in wild confusion; we shall have much work."

The Professor examined with pleasure the well-preserved stone-work of the arched doors and the artistic work of the old-time lock-smith. Little had been done in modern times to make the walls look respectable or to repair damage; but any one who took interest in the chisel and carving tools of the old builders, might perceive everywhere with pleasure that the tower could easily be changed into a masterpiece of ancient style.

The servant opened the door into the Princess's rooms. These also were simply arranged. The broken painted glass of the small window had been repaired with panes coarsely painted; only fragments of the old pictures still adhered to the lead.

"There is still much to be done here," explained the Princess; "and we shall gradually have everything arranged within the next few years."

The clatter of the Castellan's keys were heard in the anteroom, and the Professor turned towards the door.

"One moment's patience," cried the Princess, and she flew into an adjoining room. She returned in a grey cloak with a hood, which enveloped her in its folds, only the delicate face, the large beaming eyes, and smiling mouth being visible.

"It is only in this gnome costume that I venture to approach the dusty spirits of the lumber-room."

They ascended to the highest story. While the Castellan was picking out the key from the bunch, the Professor eagerly examined the door, and remarked, "More beautiful mouldings by your old lock-smith."

"I have hopes," said the Princess.

"Everything looks that way," replied the learned man.

The heavy door creaked on its hinges, and a large room presented itself to the eyes of the searchers. A bright light shone through the narrow openings in the wall upon the mysterious apartment; atoms of dust were seen whirling about in the straight shafts of air, while before and beyond all was confusion wrapt in semi-darkness. Old furniture was piled up in hopeless confusion; gigantic wardrobes with broken doors, heavy tables with balls for feet, chairs with straight backs and leather cushions, from which the horsehair bristled out; together with fragments of old weapons, halberds, corroded greaves, and rusty helmets. Indis-

tinct and vague, the forms appeared among each other: legs of chairs, flat pieces of wood with inlaid work, and heaps of old iron lying all around. It was a chaos of frippery, the artistic products of many centuries. Their hand touched the table at which a contemporary of Luther had sat; their foot pushed against a chest which had been broken open by Croats and Swede; or against the white lacquered chair, with moth-eaten velvet cushions, on which a court lady had once sat, in a hoop dress, with powdered hair. Now all lay together in desolate heaps, the cast-off husks of former generations, half destroyed and quite forgotten; empty chrysales, from which the butterflies had flown. All were covered with a grey shroud of dust—the last ashes of vanished life. What once had form and body, now, crushed into powder, whirled about in the air; clouds of dust opposed the entrance of those who came to disturb its possession; it hung to the hair and clothes of the living intruders, and glided slowly through the open door to the rooms, where varied colors and brilliant ornament surrounded the inmates, in order there to carry on the endless struggle of the past with the present—the quiet struggle that is daily renewed in great and small things which makes new things old, and finally dissolves the old in order that it may help to nourish the germ of youthful life.

The Professor glanced like a hawk amidst the legs of tables and chairs in the dusky background.

"Some things have lately been removed from here," he said; "there has been some sweeping among the furniture in the front."

"I yesterday endeavored to clean a little," said the Castellan, "because your Highness expressed a wish to enter here; but we have not gone far."

"Have you ever formerly examined the furniture in this room?" asked the Professor.

"No," replied the man. "I was only placed here last year by his Highness the Sovereign."

"Is there any catalogue of the things?" said the Professor.

The man said there was not.

"Do you know if there are chests or trunks here?"

"I think I have observed something of the kind," replied the Castellan.

"Fetch the workmen to move the things," ordered the Princess. "To-day every part of this attic shall be examined."

The Castellan hastened down. The Professor endeavored again to peep among the piled-up masses, but the glaring light from above dazzled his eyes. He looked at the princely child; she was standing in a costume of bright color at the door, like the fairy of the castle, who has ascended into the dwelling of the grey-bearded spirits of the house in order to accept their homage.

* Translation copyrighted.

"It will be a long work, and your Highness will not like the dragging about of the dusty furniture."

"I will remain with you," exclaimed the Princess; "however contemptibly small may be my share in the discovery, I will not give it up."

Both were silent. The scholar moved about impatiently among the chairs. Moths fluttered in the clouds of dust, and a brown martin flew out from the nest which it had built in a corner of the window. All was still; there was no sound but a slight regular tapping, like a pendulum striking the hour, in the desolate room.

"That is the death-watch," whispered the Princess.

"The wood-worm is doing its work in the service of nature, it dissolves what is decayed, into its elements."

The sound ceased, but after a time began to tick again, then a second; they tapped and gnawed incessantly, down, down, and further down! Over the heads of the searchers the jackdaws were croaking, and further off the song of the nightingale sounded softly upon the labor of those who were unearthing the past.

The workmen came; they brought one article after another to the front of the room. Thicker rose the discoloring dust; the Princess took refuge in the ante-room, but the Professor did not leave his post. He worked hard himself, raising and arranging things in the front row. He went back for a moment to the door to take breath, the Princess received him laughing.

"You have undergone a complete transformation. You look as if you had been awaiting resurrection in this room, and I do not think I look much better."

"I see a chest," said the Professor, and hastened back. Another confused medley of chairs' legs and backs were lifted away, and the workmen laid hold of a little chest which stood in the dark. "Set it down," ordered the Castellan, who quickly passed a large brush over it. It was carried to the light and appeared to be a trunk of pine wood with an arched top; the oil color of the paint had disappeared in many places. There were iron clamps at the corners, and a rusty key that held fast the staple of the lock, but hung loosely in the wood. On the cover of the chest, which was dusty and worn, a black '2' was visible. The Professor had the chest put at the feet of the Princess. He pointed to the cipher.

"This is probably one of the chests that the official of Rossau sent to the castle Solitude," he said, with assumed composure, but his voice trembled.

The Princess knelt down and endeavored to raise the cover, the lock broke away from the wood, and the chest opened.

Above lay a thick book, bound in parchment. Quickly the Professor pounced upon it, like a lion on

his prey, but he laid it down again immediately. It was an old missal, written on parchment, the cover damaged and torn, the layers of parchment hung loosely in the book. He put his hand again in the chest, a torn hunting net filled the remaining space; beside that some damaged cross-bows, a bundle of arrows, and small iron-work. He raised himself, his cheeks were pale, his eyes glowed.

"This is No. 2, where is No. 1," he exclaimed. He hurried back into the room, the Princess followed. "Forward, men," he cried out, "fetch the other trunk."

The men continued their work.

"There is something here," said one of the workmen; the Professor hastened to the spot, raised and drew it out, it was only an empty chest.

The work went on. The Marshal also had been brought here by curiosity; he eagerly viewed the old furniture, and caused those pieces to be placed together, which, according to his idea, might be mended and used in the castle. The staircase was filled with household goods, and one of the servants' rooms was opened that the old things might be deposited in it. An hour had passed, the room became more empty, the sun was sinking, its rays reflected the image of the opening in the wall on the opposite side; the other chest was not to be found.

"Remove everything," said the Professor, "even to the last piece of wood.

A heap of old lances, broken glasses and pottery were fetched out of the corner, also broken legs of tables, split pieces of veneered wood, and in the corner a great pewter tankard:—the space was clear. On the floor lay gnawed pieces on which the death-watch had already done its work.

The Professor entered the door again.

"This room is cleared," he said, with forced composure, to the Castellan. "Open the next room."

"I do not believe that you will find anything in it," replied the weary man. "You will only find old shelves and stoves there that formerly stood in the castle."

"Let us go in," said the Professor.

The Castellan opened the door hesitatingly; a second room, still larger and less inviting, came to view; sooty earthen pans, bricks, and slabs of slate, lay mountain-high at the entrance, and over these were wooden tools that probably had been used in the last repairs of the castle.

"I am glad to see this," said the Marshal; "such a load on the upper story is wrong. This lumber must be taken out of the tower."

The Professor had ascended a hill of slate slabs, and was seeking in the darkness for another trunk, but the chaos was too great.

"I will have it cleared out immediately," said the

Marshal, consolingly, "but it may take a long time; we shall hardly get through to-day."

The Professor looked imploringly at the Princess.

"Get more people," she commanded.

"Even with that it will soon be dark," replied the Marshal, prudently. "We shall see how far we can get. At all events the Professor may betimes to-morrow find the entrance prepared."

"Meanwhile let us shake the dust from our clothes," said the Princess, "and come into my library; it lies just under us, you can there overlook the work of the people who are clearing away. The chest shall be conveyed into my library. I will take it with me, and shall expect you."

Two men carried No. 2 into the library, and the Professor went unwilling to his room to dress.

The Princess walked about the room where the old chest had been placed, awaiting the return of the scholar. With a heavy heart she looked forward to meeting him; she concealed in her soul a wish and a commission. The Sovereign had taken leave of her this time with more kindness than he had done for years; before her departure, he had led her into a side room and spoken to her about Werner.

"You know that one cannot leave too much to honest Bergau; I should be glad if you will also do your best to keep the learned man with us. I have got accustomed to him in this short time and would unwillingly miss his enlivening society. But I do not think of myself alone. I am becoming old, and such a man would be of the greatest value to your brother for his whole life—a man in full vigor, who is always collected and calm in the midst of our distracting doings: I therefore wish this intimacy to be preserved and increased for you both: for you also, Sidonie. I have seen with especial satisfaction how enthusiastically you enter into the studies of our learned men. Your mind will not be sufficiently interested with the twittering of the well-mannered birds who surround us; some assistance from a talented person will open to you a nobler conception of the world. Endeavor to gain this man: every kind of burdensome duty shall be spared to him; what now makes his position uncertain shall be removed as soon as he is installed with us. I do not insist upon your speaking to him, I only wish it; and I wish you to believe that in this also I am thinking of your future."

Without doubt this was the case.

The Princess had listened to the words of her father with the quiet criticism that was customary between such near relations. But the words of the Sovereign on this occasion met with such an echo in her soul, that she expressed her willingness to speak to Mr. Werner.

"If you undertake this," the Sovereign said, in

conclusion, "you must not do it by halves. Employ all the mild influence that you can exercise over him, obtain his square word and promise for whatever he is inclined to accede to."

The Princess now thought over these words with disquietude. Ah! she would gladly have conveyed to the heart of this much valued man the wishes of her own, but she felt annoyed and perplexed that her secret feelings should be made subservient to the will of another.

The Professor entered the library of the Princess; he gave a glance at the casts and books which were lying about, just unpacked and unarranged, and began:

"When one's hopes have been so much raised, it is difficult to bear suspense. One cannot help laughing over the mocking accident which brings us in contact with a monk whose work is of no value, and withholds from us that of the other which is of immeasurable importance."

The Princess pointed with her hand to the door: outside were heard the steps of people carrying something.

"Only have a little patience; if there is nothing more to-day there may be to-morrow."

"To-morrow!" exclaimed the Professor; "a whole night lies between. Meanwhile the worm gnaws incessantly, and all the powers of destruction are at work. Numberless are the possibilities that separate us from our hope: that acquisition alone is certain which we have in our hands."

He examined the chest.

"It is much smaller than I imagined. By what accident did the missal lie in it? It is not even certain whence it came, and it is still very doubtful what may lie concealed in the other chest."

The Princess raised the top.

"Let us meanwhile pay attention to the little we have found."

She took up the parchment volume, and put it in the hands of the learned man. Some leaves slipped out; the Professor caught hold of them; his eyes contracted, he jumped up and hastened to the window.

"These leaves do not belong to it," he said, reading them. At last he exclaimed: "A piece of the manuscript is found."

He held out the leaves to the Princess; his hand trembled, and the agitation of his countenance was such that he was obliged to turn away. He hastened to the table and searched the missal, opening it leaf by leaf, from beginning to end. The Princess held the leaves in her hand in eager expectation, and approached him. As he looked up he saw two large eyes fixed on him with tender sympathy.

(To be continued.)

"UNITY."

With the first of March, '89, this paper has entered upon its eleventh year in an enlarged form, so that it can print each week a sermon representative of its message and mission, and at the same time it hopes by an addition to its present list of fifteen hundred new subscribers to reduce the price to a dollar, *i. e.*, to increase the capacity 25 per cent. and reduce the price 33 1/3 per cent. UNITY is the organ of the National Unity Club Bureau, it has fostered and to a large extent shaped the Postoffice Mission work, it believes in and works for People's Churches and inclusive religion. It is suspicious of sectarian tendencies and dogmatic exclusiveness. It believes that religion should be friendly to science, and that it is indebted to its triumphs. It seeks to make religion a part of and essential to all human helpings. It would make Rationalism reverent and Reverence rational. It is in search of the unities of universal religion that reaches from the Catholic Church to the Ethical Culture Society, that includes the perennial elements in Christendom, Judaism, and all other forms and names that have purified, sweetened, and ennobled life.

SPECIAL OFFER

To Readers of "The Open Court" only.

For \$1.50 we will send "UNITY" beginning with the number current on receipt of order and continuing to March 1, 1890, and will mail one each of the following pamphlets:

- Truths for the Times. By Francis E. Abbot.
 Natural Religion. By James Villa Blake.
 The Present Heaven. By O. B. Frothingham.
 The Religion of Jesus. By H. M. Simmons.
 On the Vision of Heaven. By F. W. Newman.
 Is Romanism Real Christianity? By F. W. Newman and Francis E. Abbot.
 The Change of Front of the Universe. By M. J. Savage.
 Christian Propagandism. By Francis E. Abbot.
 Evolution in its Relations to Evangelical Religion. By B. F. Underwood and others.
 Compulsory Education. By Francis E. Abbot.
 Concerning Immortality. By Frances Power Cobbe, William M. Salter, Henry M. Simmons, Minor J. Savage, and others.
 An Address. By Ralph Waldo Emerson.
 UNITY, without the Pamphlets, \$1.00. Single Copies, 5 Cents.

Secular Thought

A Journal of Liberal Thought.

The Official Organ of the Canadian Secular Union.

\$2 a Year. Published Weekly. Single Copy, 5c.
CHARLES WATTS, EDITOR.

31 Adelaide Street East, Toronto, Ont., Canada.

Read what Colonel Ingersoll says:

"I am greatly pleased with 'Secular Thought'—with its form, arrangement, and contents—above all, with its spirit. It is splendid. I don't see how it could be better. I read it with the greatest of pleasure."

Col. ROBT. G. INGERSOLL.

Read what Helen H. Gardner says:

"Permit me to congratulate you on the fine appearance and tone of 'Secular Thought.' I heartily congratulate our Canadian friends upon the fact that they are represented by a paper of which they can be justly proud, and which they need never hesitate to hand to their most delicate-minded friends, however religious they may be."

HELEN H. GARDNER.

Naturwissenschaftliche Wochenschrift.

Redaction: Dr. H. Potonic.

Verlag: Hermann Riemann.

BERLIN NW. 6, Luisenpl. 11 (Germany).

Die reich illustrierte "Naturwissenschaftliche Wochenschrift" bringt allgemein interessante Aufsätze und orientirt über die Fortschritte aus dem Gesammtgebiet der Naturwissenschaft und ihrer praktischen Anwendung, sowie über die gesammte Literatur und das wissenschaftliche Leben. Auch dem sich für Naturwissenschaft interessierenden Laien ist die "Naturwissenschaftliche Wochenschrift" durch allgemein verständliche Sprache ein wertvolles Organ.

Preis vierteljährlich in U. S. & Canada:
 80 Cts.

TWENTY-THIRD CENTURY

Devoted to Secular Religion and Social Regeneration.

HUGH O. PENTECOST, Editor.

Contains, besides crisp and pointed editorials and contributions from a corps of able writers, the Sunday Addresses of the Editor before Unitarian Congregation.

It is the only so-called "Liberal" paper that advocates radical social regeneration.

Its columns are open to the absolutely free discussion of all religious and economic theories.

Twelve pages. Issued weekly. Annual subscription, one dollar. Sample Copies Free. All subscribers will receive a Copy of Mr. Pentecost's book, "WHAT I BELIEVE."

Address:

Twentieth Century Publishing Company,

No. 4 Warren st., NEW YORK CITY.

Publications of 'The Open Court.'

Principles of Art.

From the Standpoint of Monism and Meliorism.

By Dr. PAUL CARUS.

PRICE 10 CENTS.

Being a critical dissertation upon the principles of Art in every phase of human expression.

MONISM AND MELIORISM.

By Dr. PAUL CARUS.

PRICE 50 CENTS.

Monism is defined as that unitary conception of the world which attempts to explain all problems from one principle, and Meliorism as that contemplation of life which rejecting optimism as well as pessimism, finds the purpose of life in the aspiration after constant progress to some higher state of existence; in a word, in perpetual labor towards amelioration. Monism represents the scientific, and Meliorism the ethical aspect of this philosophical system.

The author starts from Kant, points out the dualism in Kant's views and ventures to reconcile it in his monism. His own views are based on an inquiry into Hume's problem concerning the law of causation.

The appendix of Definitions and Explanations will be of special value to students of philosophical topics.

Artificial Persons

A PHILOSOPHICAL VIEW OF THE
 LAW OF CORPORATIONS

BY

CHARLES T. PALMER, B. L.

Price, 15 Cents.

Three Introductory Lectures

—on—

The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

Neatly Bound in Cloth. Price, 75 Cts.

NOTICES.

"The lectures are very suggestive, and I think his positions are generally well taken."—*Rev. H. W. Thomas, of Chicago.*

"The absurdity of the theory is manifest."—*New York Science.*

"These lectures are worthy of Max Müller as a philologist and a thinker—full of instruction and philosophical suggestion."—*Prof. Theodore W. Hunt, of Princeton College.*

"Max Müller's supremely simple theory is hotly disputed,—but it is easily vindicated, provided one is not a dualist on principle."—*Boston Beacon.*

"The lecturer states his position with great clearness and cogency and comes out of the correspondence with his critics with credit and with his reasoning unshaken."—*Chicago Times.*

"The lectures are in their way interesting, even to those who disagree with the author's views."—*The Critic.*

THE TEACHER'S OUTLOOK.

Published by The Teacher's Publishing Company, Des Moines, Iowa. A monthly magazine devoted to the interests of teachers and advanced pupils and intended to supplement the good work done by other school journals rather than to occupy the same field. Instead of filling its columns with school methods, school aids, and the details of school work, it will aim to interest the teachers in matters outside of the atmosphere of the school room, and its columns will furnish an OUTLOOK upon affairs of life, facts in science and nature which illustrate and test the theories of the schools. In this work it will hope to furnish the teacher with a natural source of inspiration and mental energy, quicken thought and make the school room a place joyous with buoyant spirits that offer a responsive greeting to the inquiring minds of youth, rather than heavy with that gloom and dullness which often surrounds the daily toil.

A leading feature of the magazine will be a monthly review of current events, civil and industrial problems, scientific inventions, discoveries, etc.

Another feature will be a very complete Review of current Literature, especially of all books and magazines coming within the sphere of its labor. We have entered into arrangements with all the leading publishers to keep us informed of all their new and prospective publications, and the Reviews will be made by competent critics.

Still another feature, and a very important one as giving a practical value to the OUTLOOK offered, will be the formation of a circle of writers out of its subscribers, from which it hopes to draw its corps of contributors. This plan is original as applied to a magazine, and is based on the idea of co-operation, or mutual helpfulness. If met with that appreciation necessary to its full execution it will be the means of introducing many new writers to the public, and of aiding many who now lack the training in the expression of thought necessary to a kindly reception in the field of literature into which their tastes would lead them. For further particulars send four cents for Prospectus, or fifty cents for magazine eight months. 112

DREAMS, SLEEP, and CONSCIOUSNESS.

By GEORGE M. GOULD, M. D.

PRICE 15 CENTS.

The researches of Dr. Gould upon the nature of consciousness, as studied from the facts of sleep and dreams, are highly interesting, not only as affording suggestions of scientific value, but as exhibiting marks of an exact and cultivated introspective talent.

The Idea of God.

By Dr. PAUL CARUS.

PRICE 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing:

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Entheism, the Monistic Conception of God.

THE MARRIAGE PROBLEM.

By E. D. COPE, Ph. D.

PRICE 15 CENTS.

A scientific discussion, from a practical standpoint, of a question now engrossing the public attention. Prof. Cope's propositions have evoked much comment and criticism.

NEW PUBLICATION.

THE

Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects

1. *The Psychology of the Cell*—Introductory.
2. *The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.*
3. *The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition; Predatory Habits of Certain Animalcula.*
4. *Colonies of Unicellular Organisms.*
5. *Recrudescence of Proto-Organisms.*
6. *Recrudescence of Higher Animals and Plants.*
7. *The Physiological Function of the Nucleus.*
8. *Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.*

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instanced, apart from the author's original investigations, the researches of Balbiani, Claparède and Lachmann, Manbas, Ribot, Haeckel, Engelmann, Espinas, Pouchet, Weber, Pfeffer, Kertl, Dujardin, Gruber, Nussbaum, Bütschli, Lieberkühn.

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Dr. C. J. Romanes, that the first appearance of the various psychical and intellectual faculties is assignable to different stages in the scale of zoological development.

16 mo., 135 pages. Cloth, 75 Cts., Paper, 50 Cts.

PHILOSOPHY.

HEDONISM AND ASCETICISM. EDITOR.....No. 81

Philosophy has two aspects. Of these, ethics forms the practical aspect, and, a systematic conception of the universe, the theoretical. Philosophy and ethics go together; fallacy in the one leads to corruption in the other. Materialism will logically end in hedonism or utilitarianism, for it places the object of life in material well-being, in happiness; Spiritualism will lead to asceticism, a renunciation of the pleasures of the world. Monism rejects both views; it sees the purpose of existence in progress, in the constant aspiration after something higher and nobler.

HISTORICAL AND CRITICAL.

THE DISCOVERY OF THE VEDA.—THE INTERPRETATION OF THE HINDU EPIC. H. OLDENBERG. Nos. 84 and 85

Prof. Oldenberg is one of the most eminent Sanskrit scholars of the present day. He tells us in popular language the story of the origin, growth, and present state of Sanskrit research. The discovery of the Veda, which forms the subject of the paper published in No. 84, must be accounted the most important acquisition to science ever made through any one branch of oriental enquiry. The results of investigation in this department have reconstructed the foundations of comparative history, philology, philosophy, and religion. Through the untiring efforts of great scholars, a new world, a new literature, a new and strange people have been revealed to us.

DEFINITIONS AND EXPLANATIONS.

THE DATA of experience are perceptions.

REALITY is the sum total of all that is.

TRUTH is the conformity of cognition to reality.

[Truth being a relation between subject and object appears to be relative in its nature. Absolute truth is a self-contradiction; it would imply cognition without a cognizing subject.

At the same time it is obvious that absolute existence (in fact everything absolute) is impossible. Reality is properly called *Wirklichkeit* in German, derived from *wirken*, to take effect. Reality is not immovable and unchangeable absoluteness, but the effectiveness of things in their relations. Reality therefore implies not only existence, but the manifestation of existence also. Existence and its manifestation are not two different things; both are one.

The idea of something absolutely Unknowable is therefore also untenable; it would imply the existence of an object whose existence is not manifested *i. e.*, existence without reality; *Sein ohne Wirklichkeit*—which is a contradiction, an impossibility.]

SCIENCE is the search for truth.

The nature of science is the economy of thought. (*Mach*.)

Economy of thought is possible through application of the laws of form to thought.

KNOWLEDGE is the possession of certain truths.

[Knowledge is, so to say, the present stock or capital with which Science works. Science cannot exist without knowledge. The object of Science is not only to increase and enlarge knowledge but also to purify the present stock of knowledge from vagueness, errors, and misconceptions.

The purpose of knowledge is that of increasing our power over nature.]

MONISM is that philosophy which recognizes the oneness of All-existence, and the Religion of Monism teaches that the individual, as a part of the whole, has to conform to the cosmical laws of the All.

RELIGION is man's aspiration to be in harmony with the All.

[Religion has been defined differently in the columns of THE OPEN COURT, but all definitions that have been presented are in strict agreement. Mr. Hegeler in No. 25, defines Religion as "man's union with the All" (taking the definition from the Lutheran Catechism "Religion ist der Bund des Menschen mit Gott durch Gott," and replacing the Word GOD by the more comprehensive word THE ALL). The editor has defined Religion as "man's consciousness of his relation to the All" (No. 24); as "Das Allgefühl im Einzelnen," the All-feeling in the individual (see foot-note page 965); as "man's conception of the world that serves him as a guiding-star through life" (page 1180).]

MORALS are man's conduct in so far as it is in unison with the All.

[The basis of morality is religion. A moral educator or preacher may justly be asked, "On what authority dost thou justify thy precepts?" And he will tell us that his authority is not personal; he speaks in the name of universal order. Accordingly his authority is that of religion. If it were not so, all his good precepts would have no foundation; they would hover in the air like beautiful dreams that have no reality.]

ETHICS is the Science of Morals; it teaches man why he must, and how he can, regulate his conduct so as to be in unison with the All.

Natural history and the history of mankind prove that here on earth a constant progress takes place developing ever higher forms of existence.

Morally good are those acts which are in harmony with the All, *i. e.*, those which enhance progress, and *morally bad* are those which are not in harmony with the All, *i. e.*, those which retard or prevent progress.

[Religion (man's aspiration to be in unison with the All) has naturally produced many superstitious notions in the world, of its origin, and of its purpose. Similarly, science (man's search for truth) has produced many errors or false notions of reality. But all the superstitions of religion do not prove that religion as such is an illusion, and all the errors of science are no evidence that science as such is a sham.

It is obvious that religion and science, as here defined, are not contradictory to, but complementary of, each other. If religion and science do not agree, it is a certain sign that our conception of either the one or the other is wrong. The history of the human mind has been one of constant conflict and reconciliation between religion and science. Their relation has repeatedly been disturbed and re-adjusted.

The unitary conception of the world affords the only basis for the union of Religion and Science, and opens a new vista of progress for both.]

The Open Court.

A WEEKLY JOURNAL

Devoted to the Work of Conciliating Religion with Science

THE PRESERVATION OF MORAL PURITY IN CHILDREN.

BY A. H. HEINEMANN.

THE aim of ethical education must be to evolve in man the capability, that is, the will and the power, to withstand temptation, to reject whatever is evil, and to desire and do what is pure and good. But it is not knowledge, but habit and use, by which alone the goal of ethical education can be attained. Habit is second nature. Train a man to the habit of thinking nothing but what is pure and good, and he will grow unable to think or to will anything impure. By means of habit, education must make a desire of the pure, and a correlative horror of the impure, a natural impulse equal in power and intensity to an inborn force, though superior to it by being conscious of itself.

Education by habit does by no means belittle the claims of the education of the intellect. Both must proceed side by side, as educational science instructs us. The boy with a well developed ethical power ought also to be possessed of a clear judgment regarding the moral value of any events confronting him. One of these events will, naturally, be an attack of the genetic, or amative passion.

But amativeness, as it affects secret organs, is also fond of secrecy and shy of observation and publicity. It will not submit to being discussed openly, but will prefer pondering over itself in a self-indulgent, dreamy sort of way. In fact, by preventing a boy, or girl, dreaming, you may count almost with certainty upon delivering his or her passion of love of everything morbid there may be in it.

Amativeness is not an active passion, else it would not be dreamy. It was of an active nature at the time of the Troubadours and Minnesingers when it stirred up men to deeds of valor. In those times woman occupied the seat of honor both at tournaments and in men's minds. She does not do so now, or, at least, she does so only in exceptional cases and with exceptional men. With most men, woman is but a necessary means for the pleasurable satisfaction of desires, an expensive luxury which man is not able or willing to deny himself. In fact, most men, and more particularly, young men, look upon the satisfaction of the genetic passion as the greatest pleasure of life, frequently to such an extent as to throw away their lives

if their monomania of love happens to meet with a disappointment. If they were able to fight for their ladies as did the knights of the Middle Ages, they would most assuredly not be in danger of committing suicide for them.

Such efforts of strength in the passion of love are very generally excluded in this day of ours. Love has become a passive passion, pent up within the mental recesses of the affected individual. That is the reason why it must now be pronounced the most violent, the most dominant passion of the period. Young men will think of their lady-love from the moment they rise in the morning until they fall asleep again; walking, working, or eating, they will, all the time, have the thought and image of their love in their minds. That constant preoccupation will, in most cases, exercise a repressive influence upon the activities of both mind and body. A laxity of muscle and of thought will frequently set in and go on increasing. At the same time there is generally an ever increasing desire of being alone and an irresistible tendency to dreamy inactivity and fanciful reverie.

From such a dreamy condition to an attempt at obtaining satisfaction of the genetic passion, the transition is easy and natural and almost sure to occur. In fact, after a boy or girl, has been allowed to abandon himself or herself, to that indolent condition of dreamy self-indulgence, escape from the defiling result is hardly possible. There is no means to prevent it except a removal of the causes of the evil, and the causes are the want of energy and of the love of exertion universally found in the present generation. Bring up pure minded boys and girls and there will be no danger of the vice of self-indulgence.

A boy with a taste for outdoor sports, for gymnastics, or for any active exertion in general, intellectual work not excluded, will, as a rule, not be inclined to give way to the spell of dreamy self-indulgence of the passion of love. When he is in love, he will pursue the object of his passion with the energy and activity of a knight-errant of the olden times. He will not stoop to the dozy self-indulgence of the love-sick weakling and will not easily become a prey to the demoralizing effects of the passion.

The means by which to prevent the excessive development of the genetic passion, consists, therefore,

in the adequate development of the talents and the strength of the boy, by which a habit of incessant activity is induced, preventing him, under any circumstances, to submit to the spell of the dreamy self-indulgence of passion. That is the main secret of the educational management of the case.

There is every opportunity at present to obtain a knowledge of the method to be followed in this sort of education. You need only go to the Kindergarten and the manual-training schools to see how the system of educating youth by means of work and habit is practically carried out.

From their earliest age, children must be kept active all the time. When still in their cradle, their attention when they are awake should incessantly be kept busy. The first gift of Frœbel, the soft ball, is of an inestimable value at the time. When the child commences to move about, it must always be engaged doing something. If inclined to discover something on its own hook, it must be watched to keep it out of mischief or danger, although it should be allowed to do as it likes as much as possible. But it must never be allowed to lie, or sit, or stand, and do nothing. Neither will there ever be an inclination to be idle. In fact, idleness is an illness, or the result of illness. It does not occur in healthy children unless they are brought up to it by being at first forced to indulge habits of inactivity.

The most dangerous time is the twilight hour of the evening before the gas or lamps are lit. It is frequently passed in a dreamy, lazy way of doing nothing, everyone indulging in apparently harmless thoughtlessness. It should be spent in talking to children, in telling tales and hearing them tell theirs, in explanations and controversy; but it should never be spent in dreams. The habit of dreaming is the source of a great looseness of thought and action inducing a love of ease and habitual slothfulness. I would never allow of such a period of twilight unless the mental activity of the company was unusually lively.

When the boys are old enough to go to school and play about with their companions by themselves, the parents should see that they have either some work to attend to, or that they played about. They must never be allowed to sit still and meditate, or dream.

It is not sufficient, however, to produce constant activity by supervision, that is by outward compulsion only. The love of activity, or exertion, must be planted in the child's mind, must be a natural tendency. Such love of exertion is not possible unless there is a real liking for the work to be done. The work, or activity must be agreeable to the talents and inclinations, to the capacities of the child. It is of paramount importance, therefore, to find out a child's natural talents and, having found them, to develop them, that is, to let

him use or manifest them as much as possible. Such activity as will strengthen and improve his innate powers, every child will love to engage in. Under such treatment habits of industry and constant exertion cannot fail to become a natural tendency of the growing man.

Another point as important as that of the love of activity, is that of purity of language and thought. Language is thought. Through impure language youth gets used to impure thought.

"That cannot be so," say people. "A child will repeat what it hears without knowing what is the meaning of the sounds repeated."

That is so, no doubt. But by repeating sounds which have an impure meaning, the ear gets used to hearing, the mouth to speaking, words having impure meaning. These impressions of the senses get fixed in the mind like any other impressions, or sensations; the mind gets used to them and will retain them. When, at a subsequent period, the child begins to understand them, they have already become part and parcel of the stock of knowledge stored in the mind. Thus it was the early and unconscious hearing and repeating done by the innocent baby which has filled the mind with impure sensations which are later transformed into impure conceptions and thoughts. It is of the utmost importance, therefore, to protect little children from hearing and repeating impure language.

This remark, timely as it no doubt is in every civilized country, is particularly appropriate here. For in no other country is impure language and, consequently, the influence of the genetic passion-perceptible at so early an age as in America. Equivocal expressions suggestive of circumstances neither comprehended nor comprehensible as yet, with kissing, courting and touching, begins with our children commonly before they get into their "teens." And with that early contact between the male and female, the secret working of the genetic passion commences. If you would ward off that impure influence, protect your children from bad language. Accustom their minds so thoroughly to purity of expression and thought that they cannot listen to, much less repeat, vile words without a feeling of disgust. It is that feeling which will cause them to persistently reject equivocation and vulgarity.

I have a little boy of thirteen who supplies me all the time with substantial proofs of the reality of the conditions just described. He will refuse listening to any of the vile talk of his playfellows, and never hesitates to tell his mother, or me, anything which may strike him as strange or suggestive of evil. When he was eleven years old, he happened to fall in with a lot of rough boys using very vile language and telling all sorts of indecent and obscene tales causing my boy

to feel an irrepressible curiosity about the sexes and the generative functions. He wanted an explanation and solution for his doubts, and I was compelled either to give him that explanation or to let him go to other sources of information. Now, I am aware of the nature of such sources as are accessible to children and I was afraid to trust my boy to them.

The other day, I know, a boy at a public school had heard a word new to him and suggestive of some secret and immodest meaning. He went to Webster's dictionary which is the book most generally consulted by both boys and girls upon these matters, and tried to find the word. A teacher (male) happened to see him at the book and asked him what word he was looking for. The boy told the master. "Oh, that is no business of yours," said the teacher. "You told us yourself we must look up any word which we do not understand," replied the boy. "So you must, but not such a kind of word," was the teacher's direction when he sent the boy away. What would the boy do then?—go somewhere else and be more eager than before to find out that thing which his teacher tried so hard to conceal from him as to actually withdraw the rule he had laid down for finding unknown words in general. And in future that boy will do as all his companions do: he will supply himself with another word beginning with the same letters and of an innocent meaning, and when asked what he is looking for, he will pronounce that word held in reserve and will, by so doing, practice himself in the art of dissimulation in addition to the improper curiosity causing him to consult the dictionary.

I had by all means to avoid bringing such consequences upon my boy. When I, therefore, found his curiosity excited to such a pitch as to require satisfaction, I made up my mind to instruct him in the natural process of propagation.

I obtained a number of books with drawings on the physiology of plants, animals and man, and commenced with plants. I showed him a great many drawings of the generative organs of plants calling his attention to the beautiful leaf-like shapes of these organs, and, more particularly, to the difference between these organs in the male and the female flowers, the transmission of the pollen, and the development of the seed in the female flower. I continued that part of the subject until he ceased asking questions upon it and said he understood the matter.

Then I proceeded to the lowest kinds of living creatures and pointed out how similar their generative organs were to those of plants. In this connection the incident of contact between male and female presented itself so naturally that the boy almost found it out by himself. The progress from worms and molluscs to fishes, birds, and mammals was now so natural as to

require hardly any further explanation, the drawings of the generative organs being enough to explain everything to the full satisfaction of the boy. Before we had advanced to man, my boy told me, I need not go any further, he had seen enough of it and thought he understood it perfectly. I was very glad to hear him say so, and much more so when he told me that none of the boys who had ever spoken to him about such matters, really did understand anything about it; they all were groping in the dark, and if any of them came again to talk to him, he would tell them that they knew nothing at all about it and that he understood the whole science of it.

Ever since the boy has been fully satisfied upon the subject. He will not listen to anything his friends will tell him upon these secret matters because he esteems their talk, idle prating of ignorance. The serious instruction he received upon the subject caused him to receive it in a sort of scientific mood excluding the possibility of frivolity and prattling levity. No doubt, therefore, this knowledge has eradicated that morbid curiosity with which the suggestions of his companions had filled him, and has thereby preserved him in all his innocence and purity of word and thought.

Another advantage of the scientific knowledge is this that it gives to the boy the courage of his opinion. He need not now be afraid of being called a baby and twitted about ignorance. On the contrary he is able to silence his opponents by the superiority of his knowledge. His strength has been increased by the study; his contempt of the ignorance displaying itself in bad jokes and vile insinuations, has become very pronounced; and his determination to act up to his knowledge and be upright and pure has grown much clearer and firmer.

THE PAPER DOLLAR.

BY WHEELBARROW.

Mr. S., of Lincoln, California, has criticized my complaint against the silver dollar. He says that I offer "only one argument against continuing the coinage and use of the dollar, namely—there is not enough silver in it." This, he says, "is about the only argument founded on fact, advanced by any opponent of the monetization of silver. Very well, the only argument "founded on fact" against the last half ton of coal I bought was that it contained only seven hundred and fifty pounds. What further argument is necessary? The coal merchant gave troy weight in mistake for avoirdupois. The quality of the coal was good enough. I complain not of that. So the nine silver dollars I got for my week's wages were good silver, but they were deficient in weight. That's all I complain of.

The weakness of my argument, says Mr. S., "is apparent upon reflecting that there is not a dollar's worth of paper in a greenback or bank-note; yet the paper dollar will buy as much as the gold dollar." The weakness of this argument consists in the fact that there is no such thing as a paper dollar. As to the pieces of paper that travel about as dollars, I will do them the justice to say that they make no claim to be anything more than promissory notes. I had one of them this morning: it was my only monetary possession in this world, and I squandered it at the meat-market, but before parting with it I read carefully the legend on it—"The United States will pay to bearer one dollar." This promise I traded for beef. I had no money to pay for the beef, but the butcher accepted the printed promise of the United States to pay for it, and I walked off with my Sunday's roast. Mr. S. thinks that the "paper dollar" buys beef because of its own value; and he reveals in that queer delusion the weakness of his own position.

When anybody tells Mr. S. that the reason why the paper promise to pay a dollar will buy beef, is because it is based on gold, and can be exchanged for gold, he replies, "Is it possible that any considerable number of those who make this reply do not know that the silver dollar can also be exchanged for gold, or for silver certificates, that are equal to gold in purchasing power?" With shame I confess that I am so ignorant as not to know that the silver dollars can also be exchanged for gold ones, and I will be thankful if Mr. S. will tell me where this wonderful miracle is done. Do they perform it at the United States Treasury? If not, will they do it at the Mint in California? If Mr. S. knows the magician who performs this valuable alchemy, will he kindly introduce me to him? I should like to win his friendship.

"Or for silver certificates." This unlucky phrase condemns Mr. S.'s argument, because if gold dollars and silver dollars are of equal value, then gold certificates and silver certificates must also be equal for similar amounts, and silver dollars could be exchanged for gold certificates; but the fact is, they can only be exchanged for silver certificates, because of their inferior value. All decrees of legislatures regulating the purchasing power of money, or the selling value of goods, are void by the constitution of nature and society. They are futile as the law which declares how many bushels of wheat shall grow on an acre of land, and how many pounds of wool a sheep shall wear in his overcoat. If silver dollars and gold dollars were equal, surely the Government would not make any distinction between them. Let Mr. S. test the Treasury, and he will see his golden vision vanish. Let him deposit ten thousand silver dollars with the Treasurer of the United States, and ask him for a gold certificate

of that amount, and the very messenger boys will laugh at him. Let him ask for a certificate to that amount simply in dollars, without specifying the metal, and the result will be the same. His certificate will be very careful to say that his deposit was in silver dollars, and the Government will pay back nothing else when the certificate is returned.

Mr. S. asks a plain, straightforward question, "Does 'Wheelbarrow' believe it would be good to retire the silver dollar, or would he have more silver put in it?" He shall have a straightforward answer. I believe that if more silver were put in it, it would do "good"—to me, and it was purely from a standpoint of self-interest that my attack upon the silver dollar was made. As a man working for wages, I confess that I am not satisfied with the weight of silver in the dollars I get for my labor, and I would like to see the metal in the silver dollar increased until it reaches the value of a dollar in gold. To tell me that a silver dollar worth eighty cents will purchase as much for me as a gold dollar worth a hundred cents, is to trifle with my common sense; it is like persuading me that fourteen ounces make as valuable a pound of coffee as sixteen ounces, and that it is a superstition to believe that there is any difference between them.

If I accept Mr. S.'s invitation to wander off with him into a discussion of the good or evil policy of "retiring" silver dollars, both of us will soon be floundering out of our depth in the flood of jargon invented by currency tinkers and quack statesmen to bewilder a lot of dupes like Mr. S. and me. What gibberish is this about "retiring" anything that is of actual value to mankind? Nature has planted the ore in the earth; men dig it out and smelt it, and refine it into silver for human benefit, and immediately a lot of financial marplots want to "retire" it into the moonbeams, or into the nebular hypothesis, or "anywhere, anywhere, out of the world." As wisely talk of "retiring" the mountains whence it comes. As well talk of "retiring" corn, or hats, or calico. The coinage of silver should be unlimited, for coining is nothing more than the government certificate stamped upon the piece of metal to the effect that it weighs so many pennyweights or grains; but it should be an honest coinage, not eighty per cent. truth, and twenty per cent. falsehood. The present Silver Coinage Act is a monument of imbecility or dishonesty. If silver coinage is a good thing, why limit it to four million dollars a month? And if it is a bad thing why compel the government to coin at least two millions a month? This kind of obstruction to nature's laws is ironically called statesmanship.

Mr. S. is kind enough to say that I am "too sensible a man to wish to see silver demonetized and left in circulation, as was done in 1873." He is

also positive that I "did not work for wages during those six terrible years from 1873 to 1878, when employers bought silver at from ten to fifteen cents discount, and paid their laborers with it at *full* value." As to that I can only say that I did work for wages during those "terrible six years," but I must confess that my employers did not oppress me to such a heartless extent as to pay me in silver dollars, because they were at a premium. I never received a dollar in silver during the whole time, because greenback dollars were cheaper than silver dollars, and my employers paid me in paper. Employers on the Atlantic coast were not so hard-hearted as they were on the Pacific coast. They didn't impose upon their workmen the cruelty of silver dollars. If they had done so, it would have been better for me. Mr. S.'s illustration curiously proves my position, that workingmen are always paid in the cheapest money current at the time, and if he will keep strict watch he will notice that in proportion to the cheapness of the dollars paid them for their wages, inversely and adversely is the dearthness of the necessities of life which they are compelled to buy.

What will I do "if silver appreciates in value until it is worth more than gold?" Well, I will cross that bridge when I come to it. But I shall never cross it, because when that appreciation comes I shall be treading the golden pavements of that celestial city where silver is cheaper than sand.

So long as the government redeems the silver dollar by accepting it for taxes at its face value, so long it may be kept at mercantile par with a gold dollar; but whenever the government knocks that prop from under it the silver dollar will fall to its bullion value; business will drop to a silver basis with a crash, and the prices of everything will rise except the price of labor. A depreciated currency is a continual menace to the working men. When I hear them clamoring to be paid in cheap money for dear work, their cry sounds like a vehement appeal for lower wages.

M. GUYAU'S FAITH.

THE CONSCIOUSNESS OF INTENSE AND EXPANSIVE LIFE CONCEIVED AS THE COMMON PRINCIPLE OF ART, MORALITY, AND RELIGION.

BY ALFRED FOUILLEÉ.*

Translated from the French by γγν.

THE predominant idea, that M. Guyau intended to develop and follow through all its main consequences, was that of "life" as the common principle of art, morality, and religion. The creative conception of all his system is the following: Life, when correctly understood, in its very "intensity" encloses a principle of natural "expansion," generosity, and fecundation. Guyau hence draws the consequence, that life

naturally within itself reconciles both the individual and social point of view, the conflicting dualism of which—always more or less apparent—has proved the stumbling-block of our extant utilitarian theories on art, ethics, and religion. According to his theory the highest task of the Nineteenth Century—the one to which he himself wished to contribute his share—was precisely "to impart a paramount prominence to the 'social' side of the human individual, and generally of all created beings"—the very side, which throughout had been too much neglected by the egotistic materialism of the last century.

While pointing out this social aspect of individual life, we should at the same time give a more solid basis to art, ethics, and to a religion, worthy of the name. At the time when Guyau studied the utilitarian philosophy, he had seen the Eighteenth Century close with the egotistic theories of Helvetius, Volney and Bentham, akin to the rather too naive materialism of de La Mettrie and even of Diderot. Our Nineteenth Century has enlarged the boundaries of science. On the one hand, matter has more and more been subtilized under the observant eye of the scientist, and the "clock-work" mechanism of de La Mettrie has become totally inadequate for the solution of the problem of life. "On the other hand, the individual, which had been regarded as isolated, pent up within its lonely mechanism, of late has appeared as essentially accessible to influences from without, in close solidarity with the consciousness of others and determinable by impersonal sentiments" (cf. Guyau *L'art au point de vue sociologique*. Introduction.) The nervous system is no longer conceived as the seat of phenomena, the principle of which surpasses the individual organism. On the contrary, solidarity predominates over individuality. It is really as difficult to bound and circumscribe in any living body an æsthetic, moral, or religious emotion, as within the same to confine heat or electricity; the physical and intellectual phenomena are equally expansive and contagious. The facts relating to sympathy, whether nervous or mental, are becoming better known; those of suggestion and hypnotic influence also begin to be scientifically investigated. From the most easily observed cases of disease we pass by degrees to the phenomena of normal influence among different human brains, and hence also among different stages of human consciousness. The Nineteenth Century will close with discoveries, as yet but vaguely formulated, but perhaps in the moral world as important as those of Newton or Laplace in the sidereal world, to wit: discoveries bearing upon the existing attraction of the human sensibilities and human wills, solidarity of intelligences, and penetrability of human consciousnesses.

* The original is published in *La Morale, l'art et la religion, d'après M. Guyau*. By Alfred Fouilleé. Félix Alcan, Paris, 1889.

Guyau, accordingly, attempts to found a scientific psychology and sociology, in the same manner as the Seventeenth and Eighteenth Centuries had founded physical and astronomical science. In his system, social feelings will reveal themselves as complex phenomena, mainly produced through attraction or repulsion of the nervous systems, and comparable to astronomical phenomena. Social science, which to a great extent is made up of ethics, æsthetics, and of religion, in Guyau's system, becomes, as it were, "a more complicated astronomy." Finally, Guyau's scientific psychology and sociology "will even shed a new light" upon metaphysics themselves. Let us take for an instance determinism. In the latter we have a doctrine, which—while denying to individuals the form of personal power, termed free-will—seemed at first to exert only a depressing influence; and yet, at the present time, this very doctrine seems to give birth to certain metaphysical hopes, still very vague, yet of unlimited bearings, making us perceive, "that our individual consciousness might possibly exist in a kind of dumb communion with all other consciousnesses; and that, on the other hand, consciousness thus expanded in the world, must, like light and heat, play a very important part; yet, doubtless, further capable of increase, and of extending through the coming ages."*

Since all life "in becoming conscious of itself" at the same time will perceive that it is indivisibly personal and socially collective, the same must also take place in regard to the "feeling" that we have of life, as soon as within us it becomes more intense and free—the feeling which we term "pleasure."

Like life, pleasure has always a certain social side, and it will more and more develop this aspect by virtue of a transformation, which is not one of the least important that the future has in store for humanity. Even the ethics of Epicurus pointed to this same conclusion. In fact, what would be a purely personal, selfish pleasure? Does there really exist any of the kind? What part can it play in life? Descending the ladder of animated beings, we perceive, that the sphere in which each being moves, becomes more and more contracted, almost clogged. Such are polyps and mollusks attached to certain fixed points. On the contrary, when we ascend to the higher orders of beings, we at once see that their sphere of action opens, widens, is fused into the sphere of action of other beings.

In man, individual feeling at all times reaches far beyond the individual itself. Pure egotism would not only be mutilation of self, but even an impossibility. Neither my griefs nor my pleasures are absolutely my

own. The thorny leaves of the Agave before developing and displaying their enormous borders, for a long time remain wrapped within each other, and forming clusters like single hearts. During this period the thorns of each leaf are impressed upon its neighbor leaf. Later, all these leaves grow in size and withdraw to a distance, but their birth-mark remains, and grows along with them, like a seal of pain impressed by life itself. The same takes place in our heart, in which from our very birth are impressed all the joys and griefs of the human race; and with each of us, despite all our efforts, the once impressed seal will remain.

In the same manner as the "I" to contemporary psychology is an illusion,—as there is no separated personality, being really made up of an infinity of beings and of small consciousnesses, or states of consciousness, so also any purely selfish pleasure is but an illusion. My own pleasure does not exist without the pleasure of others, and I feel as if the entire society must coöperate toward this end, more or less so, from the narrow circle that surrounds me and my own family, to the vast society in the midst of which I live. Such were the conceptions and theories that Guyau wished to apply to art, ethics and religion.

In Guyau's conception, the beautiful was the higher life as immediately felt in its expansive intensity and in its double activity both individual and social; ethics was that same higher life, as "willed" and sought after; religion, finally, was the higher life as "imagined"—and, indeed, imagined under the forms of a "universal society of consciousnesses." In other terms, art, ethics, and religion ought to raise individual life to the dignity of a collective life.

When art will have given us in an intense form the immediate feeling of the life that has been realized, morality shall make us "will" the life to be realized; finally metaphysics—the basis of religion—will cause us to *construct* hypothetically a world of a higher life, the supreme end of our loves, and ultimate term of our efforts.

All these considerations, as furnished by psychology, physiology, and sociology, in M. Guyau's mind abutted on a theory of solidarity at the same time organic and social, which according to him was the common principle of true æsthetics, true ethics, and true religion. The universal "determinism" to him was but the logical and mechanical form of this solidarity, which M. Guyau extended not merely to the individual or to human society, but to the entire nature.

In one of his philosophical monologues in verse,—in which the form is familiarly adapted to his unfettered frame of mind—under a sensible image we also detect his conception of universal solidarity. Thus, one day near Biarritz, while ascending a certain steep

* Guyau, *L'art au point de vue sociologique*.

path, with the usual companion of his rambles at his side, he pours forth his feelings in the following lines :

"The leafless oaks, their naked arms reach out,
Like wrestlers stripped, and eager to engage
In fierce contention, while the North-winds shout,
And vainly strive to throw them down in rage.
A dying tempest whistles up on high ;
While the mad clouds assume the changing form
Of giant birds borne headlong through the sky,
Their strong wings helpless in the stronger storm."

"Forward we march, our heads toward the ground,
Bending beneath the dolorous weight of thought ;
At last our eyes the hazy pathway found,
Not the smooth road our wistful hearts had sought,
But rough as life, and like it without end.
It's tortuous coils twined round the mountain's side ;
Eternal spirit, shine while we ascend,
Fling out a light our stumbling feet to guide."

From the broken cloud there suddenly issues a ray of light that irradiates the scenery, and the roads all around ; this single beam was sufficient to change everything, not only without, but even within :

"The rifted clouds give way, the light shines through,
To our weak hearts from Nature's ardent soul,
One thrill of the divine, and all is new,
The darkness passes, rolled up like a scroll.
The wrinkled Earth smoothes his benignant brow,
And speaks in songs ; our spirit walks abroad,
Communing with the Universe ; and now,
All things are good ; ourselves are parts of God."

"What is that force omnipotent, I ask
Whose hand exalts us to its own domain ?
Whose nerves electric move us to our task,
Of self-devotion, sacrifice and pain ?
A sunbeam warm with grace a heart can ease,
And human thought belongs to self no more,
Our spirits bend beneath it, as the trees
Bow to the sea-wind sweeping down the shore."

Cares, griefs, and sufferings seemed all to vanish away through the broken storm-cloud.

"They know not why ; but yield, as I must yield.
I am not even master of my fears,
My restless heart holds grief and joy concealed,
From my dull sight, while I am racked with fears.
The tear of sorrow and the smile of joy,
Await alike the hazard made by fate ;
They come by its consent, while I employ,
What strength I have, and learn to watch and wait."

"The vast eternal thought itself unrolls,
And fills its home, the Universe, where I
Seek for the mystic power which controls
My fate, and yours, and that of all who die.
I am, myself, of the creative word,
A syllable. What matter, if I find
That melody divine the prophets heard,
That rhythm pure, the concert of the mind."

Guyau is almost indignant at his own littleness, of not being even allowed to remain undisturbed, alone with his thoughts, free like a God :

"Within my heart I feel the budding rose,
And like the butterfly I kiss the flowers.
From you to me all pain and pleasure flows,
From me to you the same, and all the powers
Of life belong to all. No single pain
Exists, no solitary pleasure falls to me.
Whatever comes to one all share the gain,
Each ocean drop belongs to all the sea."

"I pray that I the griefs of all may share
And in your pleasures have a kindred part.
May I be happy with my race, and bear
The hearts of all within my bursting heart."

With our own radiance be each pathway bright,
Removing from the road that selfish "I,"
Let us reflect within ourselves the light
That mounts from earth, or falls from out the sky." *

And finally there follows that half-poetical and half-scientific dream, common to all evolutionists—the dream for a closing period in the world's history, when "altruistic feeling" will supersede and absorb all purely selfish, "egoistic feelings."

There is no denying the intrinsic grandeur of this indivisibly psychological sociologic conception of art, ethics, and religion. M. Guyau has developed it in a series of very different works, the unit of which is the idea of "life," of expansive fecundity inherent to the intensity of life, and finally of vital solidarity, which effects that the consciousness of true individual life is completely involved within the consciousness of our union with universal society.

FORMAL THOUGHT AND ETHICS.

THE most remarkable treatise on ethics as a science is Immanuel Kant's "Foundation of the Metaphysics of Morality." (*Grundlegung zur Metaphysik der Sitten.*) He attempts in this little book to show that the rules of moral conduct can be based on an unalterable principle, which by rational beings can and must be recognized as being of universal application. Kant says :

"As pure mathematics is distinguished from applied mathematics and pure logic from applied logic, so may the pure philosophy (the metaphysics) of ethics be distinguished from the applied philosophy of ethics, that is, as applied to human nature. By this distinction of terms it at once appears that ethical principles are not based upon the peculiarities of human nature, but that they must be existent by themselves a priori,—whence, for human nature, as well as for any rational nature, practical rules can be derived."

We prefer to call Kant's *Metaphysics of Morality* † "Formal Ethics." Formal ethics is as truly the basis of applied ethics as for instance geometry is the basis of geodesy. Formal ethics is a science as demonstrable and plain as logic or arithmetic, and like the other formal sciences will find its verification and application in experience.

Kant says :

"Will is conceived as a power of determining itself to action in accordance with the conception of certain laws. And such a power can only be met with in rational beings. Now it is the end that serves the will as the objective ground of its self-determination, and *this end, if fixed by reason alone*, must hold equally good for all rational creatures. * * *

"To know what I have to do in order that my volition be good, requires on my part no far-reaching sagacity. Unexpe-

* Versification by Gen. M. M. Trumbull.

† We here briefly review Kant's ethics in so far only as we agree, and abstain from a discussion in so far as we do not agree. Some of Kant's ideas, and more so his terminology admit of criticism. For instance, his conception of freedom is vague, and his discrimination between man as *homo noumenon* or a moral being, and man as *homo phaenomenon* or a physical being, can not be conceded in the sense he puts it.

rienced in respect of the course of nature, unable to be prepared for all the occurrences transpiring therein, I simply ask myself: Canst thou will, that the maxim of thy conduct may become a universal law? Where it can not become a universal law, there the maxim of thy conduct is reprehensible, and that, too, not by reason of any disadvantage consequent thereupon to thee or even others, but because it is not fit to enter as a principle into a possible enactment of universal laws."

Kant formulates his maxim in the following way:

"Act so as if the maxim of thy conduct by thy volition were to become a natural law."

If a maxim of conduct is fit to enter as a principle into a possible enactment of universal laws, it will be found in harmony with cosmical laws; if not, it must come in conflict with the order of things in the universe. It then cannot stand, and will, if persistently adhered to, lead (perhaps slowly but inevitably) to a certain ruin.

A will that as a matter of principle determines itself to be guided by reason alone, and thus to remain in unison with the order of the universe, Kant calls a *good will*. The command prescribed by pure reason is the "*categorical imperative*." He calls it "categorical" because it behests admit of no exception, and are to be applied with rigid universality. Since there is only one kind of reason, there is only one measure or standard of morality, which must be the same for all rational beings. A "*person*," according to Kant, is an individual who can be held responsible for his acts. A person can by the power of his reason regulate his action according to principles, and the subject-matter to which in special cases the categorical imperative obliges or binds us, is called "*duty*."

The enormous practical importance of formal thought appears here in its full significance. All formal truths are necessary truths; they possess universality, and therefore they can be employed as norms. In other words, they are ethological; they can be used as rules and constitute a categorical *ought*. Ethics is, as it were, the logic of man's conduct, and vice versa; logic may be considered as the ethics of thinking. Geometry is the ethics of measuring and arithmetic the ethics of calculation. Without formal thought and without the rigidity of the laws of formal thought, we could have no constitutive norms whatever, no basis for scientific investigation, no guidance for invention, and no foundation of ethics.

Before Kant arrived at his ethics, he had tried to explain morality from man's desire for happiness.* But he abandoned this idea entirely; and certainly, morals can not be identified with our desire for happiness, although it is true that immorality always causes much misfortune, and will, as a rule, lead to unhappi-

ness. In fact, morals are preached in order to counteract the dangers of our desire for happiness. The high-road of virtue does not appear at all pleasurable, nor does it promise ever to become so, while the by-paths of vice are extremely pleasant to look upon, and many of them will continue to be so for a long time, perhaps even to the end; and the end may be a sudden and painless death.

Happiness is like a shadow; if pursued it will flee from us; but if a man does not trouble himself about it, and strictly attends to his duties, pleasures of the best and noblest kind will crop out everywhere in his path. If he does not anxiously pursue it, happiness will follow him.

Happiness in itself, the quickened pulse of joy, the gladness of heart, and the laughter of our lips is a shallow and empty thing; it has no value, and the man who attended to his duty for the mere pleasure of having the consciousness that he has done his duty, would find his reward poor. He must attend to his duty for the sake of his duty, and he will realize that it is not happiness itself that blesses us, but the object which causes our happiness; it is not the joyous thrill as such, but the ideas, the hopes, the aspirations that joyfully thrill through the fibres of our mental existence. Accordingly, we should not so much care for happiness and for a great amount of happiness, but that our desire for happiness be satisfied with, and respond to, such motives only as possess moral value—such as are in harmony with the universal order of things.

* * *

Although we accept Kant's formal ethics as the basis of morality, thus attributing the highest authority in matters of conduct to reason, we do not in the least undervalue the importance of experience as a source of information concerning our moral aspirations. And although we maintain that, as there is but one reason, so there is but one standard of morality, we do not deny that there are many different stages and innumerable aberrations in the moral development of mankind. The abstract conception of a good will is always one and the same, being the unison of will with reason, but the conception of that which is to be looked upon as good, must necessarily vary not only with the kind and amount of reason we possess, but also with the changeable demands of the circumstances in which we live. Different conditions require different duties; and to different duties different moral ideals correspond.

Usually we are inclined to judge the actions of men of past times from the standpoint of the moral ideals of to-day. But that is entirely wrong, and many apparently barbarous deeds are justifiable—even right, with regard to the circumstances and requirements of their era. If some hero of olden times had acted ac-

* *Werke* viii, p. 676, and iii, p. 392.

cording to the higher and better ideal of these latter days, it would have been considered (and sometimes perhaps justly so) as weakness on his part. For though the ethical tendency is the same throughout, yet the evolution of ethical ideals shows different stages.

* * *

The innate qualities and talents with which nature endows certain individuals, and which therefore are justly called gifts, according to the theory of evolution, are faculties inherited from ancestors. The labor of former generations is not lost; its fruit has been preserved and handed down to the generation now living.

This fact has a profound ethical import!

There is nothing without work in this world. That easy and apparently effortless production which we admire in genius, is possible only through the inherited abilities acquired by the labor of ancestors.

The single individual, therefore, ought to be conscious of being the product of the labor of ages. And what he does, be it evil or good, will live after him in so far as his individuality impresses itself and influences his contemporaries. In consideration of this fact, man will think with reverence of the past, with regard for the future, and with earnestness of the present.

* * *

The categorical imperative of Kant appears as a norm or a regulative law which is of universal validity just as much as the norms of arithmetic or logic. All the rules of formal sciences have a normative, *i. e.*, a regulative value.

If they are rigidly applied, they will in all cases be found to be correct and to lead us to true results. The categorical imperative, however, (not unlike the norms of the other formal sciences,) is more than a mere regulative law; it is a natural law which rules the development of the world and is the cause of all progress in the history of evolution. We can verify its presence through an impartial observation of facts by experience.

Human society could not even exist, nor could it ever have risen into existence, if the moral 'ought' did not constantly prompt the majority of human minds to obey the behests of the categorical imperative. No society is possible unless it is founded upon the basis of morality.

Morality, although in a broader sense of the word, extends far beyond the province of rational beings. It does not only regulate the relations among them, it also creates the conditions from which they originate.

Cells possess all properties of organized beings: alimentation, growth, and propagation. A mother-cell, having reproduced itself by repeated divisions, is still connected with its filial cells. All cells in their union are more fit to encounter the struggle for existence.

Henceforth the work to be done for their preservation is divided and dispensed in such a way that some cells perform one, other cells an other function for the unity thus created. It is division of work, according to a general plan; and that is what constitutes an organism.

The single organ or limb of a body does no longer exist for itself but serves the idea of a larger unity of which it feels itself to be a part. The purpose, aim, and end of its existence is forthwith not in itself but in something higher than itself. This principle pervades all organized nature. Organisms cannot exist but under this condition. The relations of the different organs of an organism among themselves demand special kinds of work to be done, which, if the organs were conscious, we would not hesitate to call their duties. The organs of an organism, if in a state of health, obey this principle, and this principle is essentially a moral principle.

The same principle which produced organisms and animals, guides them in their further development; and only so far as any creature is animated by this ethical guidance, is it able to develop into some higher being. The moral principle is the star of Bethlehem that guides the foremost men of all human races to the cradle where a new truth and new duties are born and where the germs of new ideas are thriving.

The human body and the organism of society both rest on the same principle. The first higher unity is the family; families grow into tribes, and tribes form nations. The love of parents has broadened into patriotism, and no doubt the next higher ideal will be that of humanity.

The next higher stage to which natural development ever tends is its ideal, and there will be no rest in the minds of the single individuals until this ideal is realized. After that, new ideals arise and lead us onward on the interminable, infinite path of progress, not as Darwin says, merely driven by the famous law of the struggle for life, but prompted by the strife for the ideal.

The ethical principle is no mere constitutional law, proposed by a legislature as fitted to serve the majority. It is, as we have learned, a natural law pervading the universe; and a scientist must be blind to facts if he does not discover it. Even in the inorganic world, I venture to say, this law prevails, though in a broader sense. Gravitation out of a whirlpool of gaseous materials forms well-arranged solar systems. It is the law of order and unity which dispenses to different bodies the different parts to be performed. The law of gravity, as formulated in mathematical terms by Newton, is the ethical rule of primordial matter; and if the single atoms of a nebula which are still rushing in different directions, could tell us their

ideal, it would be that of a harmoniously regulated solar system. The chaos will clear, according to simple mechanical rules; the ideal will be realized, and the general turmoil will give way to order.

* * *

This world is not a world of happiness, but of ethical aspiration. The essence of all existence is evolution or a constant realization of new ideals. True, it is the struggle for life; but if you look at it more closely, is it really life that the progressive part of humanity is striving for? No, they sacrifice even their lives for some higher purpose, for their ideal. If we look upon the martyrs of progress, it would indeed be a strange contradiction to say that people are consciously sacrificing and losing their lives in a struggle for life.

The ideal is erroneously supposed to be an imaginarily nonentity; or the illusion of an enthusiastic—perhaps even a morbid—brain. An ideal, however, is a part of our soul, and it is such as prompts us to action, and can regulate all our conduct in life. The power and importance of ideals are greatly increased because they can easily be imparted to others in a few words. A martyr may die, but his heroism can at the same time be impressed on the minds of his very hangmen, so that the best part of his soul is implanted into their souls, and triumphs through the sacrifice of his life.

Ideals are the most intense realities imaginable. Physically considered, they are certain organized structures in a living brain. The mechanical work done by the combustion of the oxygen in a few drops of blood is extremely small, and how great, incalculably great, is the result obtained! Here is the *ὅδός μοι ποῖ σῶσός καὶ κινήσω τὴν γῆν** of which Archimedes spoke. The thinking of an ideal may not cost more expenditure of energy than 0.001 foot-pound, and yet it may revolutionize the world.

The ideal is no mere fiction, it is a power of reality, pervading the universe as a law of nature; and with regard to humanity it points out to man the path of progress. Progress, if it is guided by the ideal, will produce new and better eras for humankind. And if a moral tendency were not the fundamental law of nature, there could not be any advancement, development, or evolution.

P. C.

AN INSTANCE OF HIGHER HUMANITY.

THE noble nature of a higher humanity came with spontaneous vigor to the front in the moment when in the Samoan waters the men-of-war of three nations struggled against the fury of the elements. The London *Telegraph* is greatly struck by the gallant bearing

* Translated: Give me a place to stand on and I will move the world.

of the crew of the Trenton when in the midst of the death-dealing hurricane they saluted the more fortunate Calliope as she struggled out to sea.

"Almost sure," says the *Telegraph*, "of instant death themselves they could see the queen's ship at her utmost steam pressure fighting fathom by fathom her way to life and safety and appreciate the gallantry of the effort, cheer the brave, handsome ship defying the hurricane, and, finally, see her glide past, overcoming the roll of the sea and the savage wind with the generous pleasure of true mariners, glad of a smart and daring deed.

"We do not know in all naval records any sound which makes a finer music upon the ear than that cheer of the Trenton's men. It was distressed manhood saluting triumphant manhood, the doomed greeting the saved, it was pluckier and more human than any cry ever raised upon the deck of a victorious line of battle ship; it can never be forgotten by Englishmen speaking of Americans."

CORRESPONDENCE.

MRS. ELLA E. GIBSON ON DR. BROWN'S BOOK.

To the Editor of THE OPEN COURT.

I AM so well pleased with Doctor Brown's book, just issued, that I cannot forbear requesting space to say a few words in its favor. It is entitled "Researches in Oriental History," which embraces, 1) Researches in Jewish History; 2) in Zoroastrianism; 3) Derivation of Christianity; 4) Whence came the Aryans?

Its author believes this is the only successful attempt to trace the Messianic idea from its fountain and follow it until developed into Christianity. Let every thinker carefully read this compendious volume, and then judge if the author has not made good his claim.

One thing is certain, a vast amount of Christian authority has been consulted, quoted, and adduced, and if the author has arrived at false conclusions, based on Christian evidence, it is more the fault of the Christian than his own. He proves by their own investigations and admissions, in some cases, that there are no monumental traces of the Jews ever having been in Egypt, that they were not a nation previous to their captivity, only 445 years before the Christian era, and that the Christian religion was derived from myths many thousand years old.

It is hoped that this book will be extensively read, not only by radicals, but by conservatives also. It is filled with valuable historical facts that enquirers cannot afford to lose. The whole book, with table of contents, makes 407 12mo pages. It is printed from new long primer type, on fine, double calendered, white paper, and strongly bound in muslin. Price \$1.50, sold by the author, G. W. Brown, M. D., Rockford, Ill. Further, I am not advised at this date.

ELLA E. GIBSON.

BARRE, MASS., April 25, 1889.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXV. — Continued.

The Professor seized the two leaves of the manuscript, and said, "What I have here, is both valuable and discouraging; one could almost weep that it is not more; it is a fragment out of the sixth book of the annals of Tacitus, that we already possess in another manuscript. These are two leaves of a parchment

* Translation copyrighted.

volume, but between them many are lost. The writing is well preserved—better than I should have expected. It is written by a German, in the characters of the twelfth century."

"He looked quickly over the contents in the light of the setting sun. The Princess glanced over his shoulder curiously at the thick letters of the monk's hand.

"It is correct," he proceeded, more calmly, "the discovery is of the greatest interest. It will be instructive to compare this manuscript with the only one extant." He looked at it again. "If it is a copy," he murmured, "perhaps both indicate a common source. Thus the manuscript that we are seeking must be torn; these leaves have fallen out, and perhaps during the packing up have been shoved into a wrong book. There is much still that is mysterious; but the main fact appears to me certain, that we have here a remnant of the manuscript of Rossau, and this discovery ought to be a guarantee that the remainder is at hand. But how much of it?" he continued, gloomily, "and in what condition will it be?"

He again listened anxiously to the steps of the men who were clearing away in the loft. He rushed out of the room up the stairs, but returned in a few minutes.

"The work goes on slowly," he said; "as yet there is nothing to be seen."

"I do not know whether to wish that it should go on quickly," exclaimed the Princess, cheerfully; but her eyes gave the lie to her smiling mouth. "You must know that I am very selfish in helping you to find the manuscript. As long as you are searching you belong to us. When you have obtained the treasure, you will withdraw yourself into your invisible world, and the retrospect alone will remain to us. I have a mind to close the remaining rooms of the house, and only to open one to you each year, until you have become quite at home with us."

"That would be cruel not to me alone," replied the Professor.

The Princess stepped up to him. "I do not speak mere empty words," she said, in a changed tone. "My father wishes you to make your home with us. Bergau is commissioned to enter into business arrangements, but they are not of the nature to determine your decision. Yet when I express the same wish, that you should remain with us, I do it from my own heart."

"This demand upon me is very unexpected," answered the learned man, with astonishment. "My custom is to weigh such proposals calmly, and from different points of view. I therefore beg your Highness not to require an answer."

"I cannot let you off," exclaimed the Princess. "I should like to gain you in my own way. You shall

choose your office and occupation here as freely as is compatible with our different relations: you shall have every kind of distinction, and every wish that it is in the power of the Sovereign to satisfy shall be fulfilled."

"I am a teacher in the University," replied the Professor. "I teach with pleasure, and not without success. My whole nature and the course of my education fit me for this vocation. The rights and duties which enclose my life have a firm hold on me. I have pupils, and I am engrossed with the work in which I wish them to partake."

"You will never find pupils that will be more truly devoted, or cling more warmly to you, than my brother and myself."

"I am not a tutor who can for any length of time oversee the duties of a prince; I am accustomed to the rigid method of the professor, and to quiet labor among my books."

"This last part of your occupation, at least, will not be lost to the world by your remaining here. This is just the place where you would find leisure, perhaps more than among your students."

"This new life would bring me new duties," replied the Professor, "which I should feel called upon to fulfill. It would occasion me also distractions to which I am not accustomed. You invite a man whom you regard as firm. True, in his own circle of life, that character he possesses; but you have no surety that in another sphere of life he will continue to be so. Do not believe that under changed circumstances I shall retain the repose and calmness of effort that the mind of a worker needs; and my dissatisfaction at inner disturbances would certainly make itself felt upon those about me. But even if I could hope for all regarding my home and my private relations that would make life satisfactory to me, I must still take into consideration where I can personally be most useful; and I am not at present convinced that this would be the case here."

The Princess looked down sadly. The steps of the men who were to free the manuscript from the piles of rubbish still continued to sound above.

"Yet," continued the Professor, "if we were to be fortunate enough to find the manuscript, many days, perhaps many years of my life would be taken up by a new task, which would be so great that I might find my University occupations a burden. Then I should have a right to ask myself, in what surroundings I should best be able to advance this work. In this case, I should also have a right to leave the University for a long time. But if I do not find it, it will be painful to me to part from here, for my soul will long hover restlessly about this place."

"I will not let you off so easily," cried the Princess. "I hear only the words, duty and manuscript. Is the

liking that we show to you, then, of no value to you? Forget, now, that I am a woman, and consider me as a warm-hearted boy, who looks up to you devotedly, and is not quite unworthy of your interest."

The Professor looked at the student who stood before him and did not wish to be considered a woman. The Princess had never looked so attractive. He gazed on the blushing cheeks, on the eyes which were fastened so expressively on his countenance, and on the rosy lips which trembled with inward emotion. "My pupils generally look different from that," he said, softly, "and they are accustomed to criticize their teacher more stringently."

"Be content for once," said the Princess, "with finding pure admiration in a susceptible soul. I have before said how much I value your acquaintance. I am no empress who governs a kingdom, and do not wish to employ your powers in my interest. But I should consider it the highest happiness to be in intimate relations with your mind, to listen to the noble words you utter. I feel a longing to look upon life with the clear eyes of a man. You have easily, as if in play, solved riddles that have tormented me, and answered questions with which I have struggled for years. Mr. Werner, you have taken a kind interest in me; if you go from here, I shall find myself alone in those pursuits with which I should most prefer being occupied. If I were a man I should seek you as my teacher; but I am fettered here, and, I beckon you to me."

The learned man listened, entranced, to the soft voice that spoke so persuasively.

"I do not beg for myself alone," continued the Princess, "my brother also needs a friend. It will be his task to take charge of the welfare of many. What you could do for his mind would be for the benefit of others. When I look away from the present, and dream of the future of our princely house and of this country, I feel proud that we, brother and sister, have a presage of what will be demanded in our time from princes, and I feel an ambition that we should both, before all others, show ourselves worthy of this high calling. I hope to see a new life developed in my home, and my brother and myself surrounded by the best minds of our nation. Thus we should live sensibly and earnestly together, as our times require; it should be no pleasure-loving Court after the old style, but a hearty intercourse between the Sovereign and the mind of the nation. That will make us freer and better in ourselves, and will be an advantage to the whole people; it will also be a bright remembrance for future times. When I think of such a future, then, Mr. Werner, I see you as the dear companion of our life, and the thought makes me proud and happy."

The sun was setting, and its last rays fell glowing

upon the Princess and the head of the scholar. Sweetly sounded the song of the nightingale among the elder-bushes; the Professor stood silent opposite the beautiful woman who painted life to him in such rosy colors; his heart beat and his strength failed him. He saw before him two eloquent eyes, and the sound of the entreating words, "Remain with us," rang with entrancing magic once more in his ear.

Something rustled near the Princess; the leaves of the manuscript which she had taken fell to the ground. The Professor bent down to pick them up, and as he raised himself again began, in a feeble tone:

"Your Highness takes a bright look into the future; my eye is accustomed only to read single lines in the history of past ages. Here lies my first task; my dreams hover about these leaves. I am only a man of the study, and I should become less were I to endeavor to become more. I know that I deprive myself of much, and in this hour, when a vision of a brilliant life shines before me so invitingly, I feel this more deeply than ever. But my greatest happiness must be, from within quiet walls, to impress upon the souls of others what will there blossom and bear fruit. My greatest reward must also be that in hours of triumph, when filled with the consciousness of power, some pupil of mine will give a fleeting thought to the far-distant teacher, who has been but one among the thousands that have formed him, but one among the many sowers in the limitless fields of science."

Thus spoke the scholar. But while speaking, with a severe struggle for composure, what was true and honorable, he did not think only of the truth, nor only of the treasure which he was seeking, but of the greater one which he had left in order to pursue his quest with the beautiful fairy of the tower. He heard the beseeching words, "Do not go, Felix," and they were a timely warning. "When I return to her, will she be contented with me?" thought the innocent man. He was spared the necessity of asking the question.

The rolling of a carriage was heard below, and the steps of the servant who was coming to announce an arrival.

"Is your will so inflexible, your intention so firm!" exclaimed the Princess, passionately. "But I am also obstinate; I shall continue my entreaties. War between us two, Mr. Werner! Farewell, till evening."

She hastened down the steps. The evening light disappeared behind dark clouds; the mist hovered over the meadows and hung on the tops of the trees; and the daws flew croaking round the walls of the tower. The door of the room above creaked on its hinges, and the Castellan rattled his keys, while the scholar looked lovingly at the leaves which he held in his hand.

(To be continued.)

TO LONGFELLOW, HAWTHORNE, AND THOREAU.

BY ISAAC K. FRIEDMAN.

THREE names that fell at once upon our world,
 Three men who wrought with might for one grand aim,
 To spread their country's beauty, valor, fame,
 Three pens which flashed as one, and wildly whirled

Around in shapes fantastical, and hurled
 Their force against all sin, that hides its shame
 Behind some gaudy veil or luring name;
 Then turned around the vale of love, unfurled

New scenes of beauty, showed new paths which led -
 About the realms of song, and yet each pen
 Revolved about a different sphere, but met

At one grand centre where above was shed
 The light of stars, and voices said: "Ye men
 Have written what your land will ne'er forget."

BOOK REVIEWS.

THE IMMANENT GOD. *A. W. Jackson.* Boston: Houghton, Mifflin & Co.

We have here a series of eight sermons, manifestly written from the liberal standpoint, dealing with the ever present religious problems of God, Prayer, and Immortality. They are much above the majority of printed pulpit discourses both in literary style and intellectual substance, and will doubtless bring a word of help and strength to many readers. c. p. w.

THE CRITICAL PERIOD OF AMERICAN HISTORY. *John Fiske.* Boston: Houghton, Mifflin & Co.

Prof. Fiske's books are always of the first order, both in the high range of his chosen subjects, the well-stocked and philosophical understanding he brings to their discussion and the readable quality of all his writings. The above work derives a peculiar interest from its appearance during or preceding the Centennial period. The writer explains the derivation of his title, suggested by the remark of Thomas Paine on hearing the news of the Treaty of 1783, "The times that tried men's souls are over;" a prediction which the succeeding five years prior to the adoption of the national constitution and the election of Washington as first president of the United States thoroughly disproved. Prof. Fiske's book shows very clearly that the most critical and trying times in a nation's history are not necessarily connected with the dramatic scenes and incidents of a revolutionary war, but in the after time of external peace, when the work of new upbuilding and political reconstruction begins. Enthusiasm born of a high moral purpose is sufficient to carry a nation through the first; but a firm and steadfast conviction, accompanied by unflinching resolution, and sublime patience are needed in the second. Prof. Fiske's latest work follows naturally and it is not necessary to say, worthily in the line of succession marked out by his previous historical writings, which should be included some day in a complete history of the American Republic. c. p. w.

LA MORALE, L'ART, ET LA RELIGION, D'APRES M. GUYAU. *Alfred Fouillée.* Paris: 1889. Felix Alcan.

M. Alfred Fouillée in a series of nine essays recapitulates, explains, and comments upon the ideas of his gifted friend, M. Guyau, on the subject of Ethics, Art, and Religion. Jean-Marie Guyau, who died prematurely on the 31st of March, 1888, at the age of 33 years, nevertheless left behind a series of remarkable works, which, in point of style and original thought, are at the present time attracting considerable attention. As legitimately claimed by M. Fouillée, in France M. Guyau ranks as the foremost original

thinker and philosopher-poet of the evolutionist school. In his "La Morale anglaise contemporaine" he attempted to correct and complete the evolutionist ethics of Darwin and Spencer; while in "Les Problèmes de l'esthétique contemporaine," and "Vers d'un philosophe," and still other works he applies his theories to art and religion. At another place of this number the reader will find an English translation of M. Fouillée's second essay which faithfully explains M. Guyau's lofty ideals as a moralist and poet. He above all interests us in the latter capacity. Guyau, in fact, may be considered as one of the earliest monist poets of France, for, notwithstanding the fanciful garb in which he clothed some of his conceptions, such indeed, the reader will find him, and even more consciously so, than any other contemporary French poet. M. Fouillée, in his concluding essay, with a touching pathos dwells upon his friend's exuberant and unflagging mental activity, despite the depressing influence of long and intense physical sufferings. Guyau's last moments, in more than one sense, worthily portray the noble attitude of a dying "philosopher-poet" of the monistic religion.

PROLEGOMENA TO IN MEMORIAM. With Index to the Poem. *Thomas Davidson.* Boston: Houghton, Mifflin & Co.

Prof. Davidson's work inevitably recalls another of somewhat similar nature, and dealing with the same theme, written by John F. Genung and published five years ago by the same firm. The two books are, however, quite different, though each aims to interpret, and supply a running commentary on the great poem with which it deals. Mr. Genung's work is that of the literary critic, and Prof. Davidson's of the philosophical student. Mr. Genung deals with the literary form and structure of the poem, building up a theory of his own on what he calls the three cycles, marked by the returning Christmas-tide, into which he divides it. Prof. Davidson concerns himself but very little with questions of this kind, confining his attention almost entirely to the subject-matter of the poem. He pronounces "In Memoriam" the greatest modern poem, and ranks it, so far as its moral purpose is concerned, with the great world-poems of Faust and the Divine Comedy, "Since a man's moral world is the response to his whole moral nature, including three elements, insight, love and energy, the catastrophe may come through the failure of any one of these, *i. e.*, through doubt, widowed or blasted affection, or unavailing activity. The world of a Faust is shattered by the first, that of a Tennyson by the second, that of a Charles Albert by the third." The writer pronounces the poem a noble and triumphant tribute to faith, and explains at some length in his introduction the nature and office of this particular mental attribute or condition. Prof. Davidson is the disciple and expounder of Rosmini, and takes opportunity to quote from that writer, saying that no other modern theologian has dwelt so explicitly with the subject of faith. He traces the progress of the poet's mind from despair and doubt, engendered by sorrow, to hope and a more assured belief, based on a closer study of nature's laws, and that higher spiritual perception which must outrank even logical understanding in the solution of the deepest problems of fate and being. Prof. Davidson's book will be found a helpful and inspiring guide to the study of a poem dealing with the profoundest questions of religion and philosophy. It is written in the clear forcible style that makes his work equally free from verbiage and that obscurity of thought, which often in interpretative labors of this kind, tries to hide itself in a mass of wordy and meaningless sentences. c. p. w.

Did Man Fall? The Location and Topography of the Garden of Eden a Fact, etc., a publication of The Truth Seeker Company, of New York, forms an interesting study in the topographical science of the Book of Genesis. The author's (Mr. Israel W. Grob's) exegesis of the book of Genesis hardly accords with the orthodox exposition.

"Free Thought,"

A Liberal Journal.

Published Weekly at 504 Kearney Street, San Francisco, Cal.

Editors:

SAMUEL P. PUTNAM, *President of California State Liberal Union.*

GEO. E. MACDONALD, *Formerly with the New York Truth Seeker.*

Mr. Putnam is lecturing in the Pacific States and his "News and Notes" of travel are an interesting feature of the paper.

Secular Thought

A Journal of Liberal Thought.

The Official Organ of the Canadian Secular Union.

\$2 a Year. Published Weekly. Single Copy, 5c.
 CHARLES WATTS, EDITOR.

31 Adelaide Street East, Toronto, Ont., Canada.

Read what Colonel Ingersoll says:
 "I am greatly pleased with 'Secular Thought'—with its form, arrangement, and contents—above all, with its spirit. It is splendid. I don't see how it could be better. I read it with the greatest of pleasure."
 Col. ROBT. G. INGESSOLL.

Read what Helen H. Gardner says:
 "Permit me to congratulate you on the fine appearance and tone of 'Secular Thought.' I heartily congratulate our Canadian friends upon the fact that they are represented by a paper of which they can be justly proud, and which they need never hesitate to hand to their most delicate-minded friends, however religions they may be."
 HELEN H. GARDNER.

THE TEACHER'S OUTLOOK.

Published by The Teacher's Publishing Company, Des Moines, Iowa. Monthly magazine devoted to the interests of teachers and advanced pupils and intended to supplement the good work done by other school journals rather than to occupy the same field. Instead of filling its columns with school methods, school aids, and the details of school work, it will aim to interest the teachers in matters outside of the atmosphere of the school room, and its columns will furnish an OUTLOOK upon affairs of life, facts in science and nature which illustrate and test the theories of the schools. In this work it will hope to furnish the teacher with a natural source of inspiration and mental energy, quicken thought and make the school room a place joyous with buoyant spirits that offer a responsive greeting to the inquiring minds of youth, rather than heavy with that gloom and dullness which often surrounds the daily toil.

A leading feature of the magazine will be a monthly review of current events, civil and industrial problems, scientific inventions, discoveries.

Another feature will be a very complete review of current literature, especially of all books and magazines coming within the sphere of its labor. We have entered into arrangements with all the leading publishers to keep us informed of all their new and prospective publications, and the Reviews will be made by competent critics.

Still another feature, and a very important one as giving a practical value to the OUTLOOK offered, will be the formation of a circle of writers out of its subscribers, from which it hopes to draw its corps of contributors. This plan is original as applied to a magazine, and is based on the idea of co-operation, or mutual helpfulness. If met with that appreciation necessary to its full execution it will be the means of introducing many new writers to the public, and of aiding many who now lack the training in the expression of thought necessary to a ready reception in the field of literature into which their tastes would lead them. For further particulars send four cents for Prospectus, or fifty cents for magazine eight months. 112

PUBLICATIONS OF "THE OPEN COURT."

The Idea of God.

By Dr. PAUL CARUS.

PRICE 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing:

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Entheism, the Monistic Conception of God.

Three Introductory Lectures

The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

Neatly Bound in Cloth. Price, 75 Cts.

NEW PUBLICATION.

THE

Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects:

1. The Psychology of the Cell—Introductory.
2. The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.
3. The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition; Predatory Habits of Certain Animalcula.
4. Colonies of Unicellular Organisms.
5. Fecundation of Proto-Organisms.
6. Fecundation of Higher Animals and Plants.
7. The Physiological Function of the Nucleus.
8. Correspondence between Alfred Binet and Ch. Richet (Professor of Psychology in the Faculty of Medicine at Paris) respecting Cellular Psychology.

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instanced, apart from the author's original investigations, the researches of *Balbiani, Chaperon, de Hermy, Maudsley, Ribot, Haeckel, Engelmann, Espinas, Pouchet, Weber, Pfeffer, Kent, Dujardin, Gruber, Nussbaum, Bütschli, Lieberkühn.*

In a preface written especially for the American edition, M. Binet connects the work of the English scientist, Dr. G. J. Romanes, with the first appearance of the various psychical and intellectual faculties is assignable to different stages in the scale of zoological development.

16 mo., 135 pages. Cloth, 75 Cts., Paper, 50 Cts.

OPEN COURT PUBLISHING COMPANY,

TO ADVERTISERS!

For a check for \$30 we will print ten-line advertisement in One Million issues of leading American Newspapers and complete the work within ten days. This is at the rate of only one-fifth of a cent a line, for 1,000 Circulation! The advertisement will appear in but a single issue of any paper, and consequently will be placed before One Million different newspaper purchasers; or FIVE MILLION READERS. If it is true, as is sometimes stated, that every newspaper is looked at by five persons on an average, ten lines will accommodate about 75 words. Address with copy of Adv. and check, or send 30 cents for Book of 258 pages, GEO. P. ROWELL & CO., 10 SPRUCE ST., NEW YORK.

We have just issued a new edition of our Book called "Newspaper Advertising." It has 256 pages, and among its contents may be named the following Lists and Catalogues of Newspapers:—

DAILY NEWSPAPERS IN NEW YORK CITY, with their Advertising Rates.
 DAILY NEWSPAPERS IN CITIES HAVING more than 100,000 population, containing all but the best.
 DAILY NEWSPAPERS IN CITIES HAVING more than 50,000 population, containing all but the best.

A SMALL LIST OF NEWSPAPERS IN which to advertise every section of the country; being a choice selection made up with great care, guided by long experience.

ONE NEWSPAPER IN A STATE. The best one for an advertiser to use if he will use but one.
 BARGAINS IN ADVERTISING IN DAILY Newspapers in many principal cities and towns, a List which offers peculiar inducements to some advertisers.

LARGEST CIRCULATIONS. A complete list of all American papers issuing regularly more than 25,000 copies.

THE BEST LIST OF LOCAL NEWSPAPERS, covering every town of over 5,000 population and every important county seat.

SELECT LIST OF LOCAL NEWSPAPERS, in which advertisements are inserted at half price.

547 VILLAGE PAPERS, in which advertisements are inserted for \$2.25 a line and upward. In this whole lot—one half of all the American Weeklies.
 Book sent to any address for THIRTY CENTS.

Review of Recent Work of THE OPEN COURT. PHILOSOPHY.

HEDONISM AND ASCETICISM. EDITOR. No. 81

Philosophy has two aspects. Of these, ethics forms the practical aspect, and, a systematic conception of the universe, the theoretical. Philosophy and ethics go together; fallacy in the one leads to corruption in the other. Materialism will logically end in hedonism or utilitarianism, for it places the object of life in material well-being, in happiness; Spiritualism will lead to asceticism, a renunciation of the pleasures of the world. Monism rejects both views; it sees the purpose of existence in progress, in the constant aspiration after something higher and nobler.

HISTORICAL AND CRITICAL.

THE DISCOVERY OF THE VEDA.—THE INTERPRETATION OF THE HINDU EPIC. H. OLDENBERG. Nos. 84 and 85

Prof. Oldenberg is one of the most eminent Sanskrit scholars of the present day. He tells us in popular language the story of the origin, growth, and present state of Sanskrit research. The discovery of the Veda, which forms the subject of the paper published in No. 84, must be accounted the most important acquisition to science ever made through any one branch of oriental enquiry. The results of investigation in this department have reconstructed the foundations of comparative history, philology, philosophy, and religion. Through the untiring efforts of great scholars, a new world, a new literature, a new and strange people have been revealed to us.

DEFINITIONS EXPLANATORY OF THE POSITION OF "THE OPEN COURT."

THE DATA of experience are perceptions.

REALITY is the sum total of all that is.

TRUTH is the conformity of cognition to reality.

[Truth being a relation between subject and object appears to be relative in its nature. Absolute truth is a self-contradiction; it would imply cognition without a cognizing subject.

At the same time it is obvious that absolute existence (in fact everything absolute) is impossible. Reality is properly called *Wirklichkeit* in German, derived from *wirken*, to take effect. Reality is not immovable and unchangeable absoluteness, but the effectiveness of things in their relations. Reality therefore implies not only existence, but the manifestation of existence also. Existence and its manifestation are not two different things; both are one.

The idea of something absolutely Unknowable is therefore also untenable; it would imply the existence of an object whose existence is not manifested *i. e.*, existence without reality; *Sein ohne Wirklichkeit*—which is a contradiction, an impossibility.]

SCIENCE is the search for truth.

The nature of science is the economy of thought. (*Mach*.)

Economy of thought is possible through application of the laws of form to thought.

KNOWLEDGE is the possession of certain truths.

[Knowledge is, so to say, the present stock or capital with which Science works. Science cannot exist without knowledge. The object of Science is not only to increase and enlarge knowledge but also to purify the present stock of knowledge from vagueness, errors, and misconceptions.

The purpose of knowledge is that of increasing our power over nature.]

MONISM is that philosophy which recognizes the oneness of All-existence, and the Religion of Monism teaches that the individual, as a part of the whole, has to conform to the cosmical laws of the All.

RELIGION is man's aspiration to be in harmony with the All.

[Religion has been defined differently in the columns of THE OPEN COURT, but all definitions that have been presented are in strict agreement. Mr. Hegeler in No. 25, defines Religion as "man's union with the All" (taking the definition from the Lutheran Catechism "Religion ist der Bund des Menschen mit Gott durch Gott," and replacing the Word God by the more comprehensive word THE ALL). The editor has defined Religion as "man's consciousness of his relation to the All" (No. 24); as "Das Allgefühl im Einzelnen," the All-feeling in the individual (see foot-note page 965); as "man's conception of the world that serves him as a guiding-star through life" (page 1180).]

MORALS are man's conduct in so far as it is in unison with the All.

[The basis of morality is religion. A moral educator or preacher may justly be asked, "On what authority dost thou justify thy precepts?" And he will tell us that his authority is not personal; he speaks in the name of universal order. Accordingly his authority is that of religion. If it were not so, all his good precepts would have no foundation; they would hover in the air like beautiful dreams that have no reality.]

ETHICS is the Science of Morals; it teaches man why he must, and how he can, regulate his conduct so as to be in unison with the All.

Natural history and the history of mankind prove that here on earth a constant progress takes place developing ever higher forms of existence.

Morally good are those acts which are in harmony with the All, *i. e.*, those which enhance progress, and *morally bad* are those which are not in harmony with the All, *i. e.*, those which retard or prevent progress.

[Religion (man's aspiration to be in unison with the All) has naturally produced many superstitious notions in the world, of its origin, and of its purpose. Similarly, science (man's search for truth) has produced many errors or false notions of reality. But all the superstitions of religion do not prove that religion as such is an illusion, and all the errors of science are no evidence that science as such is a sham.

It is obvious that religion and science, as here defined, are not contradictory to, but complementary of, each other. If religion and science do not agree, it is a certain sign that our conception of either the one or the other is wrong. The history of the human mind has been one of constant conflict and reconciliation between religion and science. Their relation has repeatedly been disturbed and re-adjusted.

The unitary conception of the world affords the only basis for the union of Religion and Science, and opens a new vista of progress for both.]

RISE OF THE PEOPLE OF ISRAEL.

BY PROF. CARL HEINRICH CORNILL.

Translated from the German by *ג'ג'ו*.

ANYONE wishing to speak upon the history of the people of Israel must regard himself as particularly favored, from the very nature of the subject itself. To all of us, Abraham and Moses, Saul and David, and the others of whatever name, are like dear, old acquaintances. These, in fact, are among the first impressions which the susceptible minds of children receive, and the unique magic of religious poetry that clings to these legends always deeply and ineffaceably impresses itself upon their youthful hearts; and even he who has long since forgotten to look upon the Bible with the eyes of faith, nevertheless will not be able to wipe out altogether those tender youthful memories.

I may, accordingly, anticipate a general interest in and, at least in its broad outlines, suppose a certain general knowledge, of the subject to be treated. Still, on the other hand, this knowledge is not so complete that I might not hope to be able to show those old and well-known forms in a new light, and through the accumulation of various details and the revelation of a grand historical inward connection, to work them into well-colored and realistic historical pictures.

Of truth, what an astonishing wealth and variety of separate material is here ready at hand! The history of the people of Israel, in fact, shares with the common and many-sided life of humanity, the eminent quality of being interesting at whatever point we may touch it. We may turn our attention to characters more particularly belonging to political history and we shall behold a Saul, David, Ahab; or to the heroes of the soul, and we shall encounter Moses, Samuel, Elia. We behold the ruin of the people as a political nation through Babylonian conquest, and the resurrection of the people as a religious sect through Ezra and Nehemiah. The ideal, heroic figures of the early Maccabees justly awaken our admiration, and even their degenerate descendants, during the period of the people's decadence, are themselves not altogether destitute of a certain attraction. The truculent grandeur of a King Herod, and the appalling extermination of the nation by the Roman sword—the most heartrending catastrophe, perhaps, that history ever has witnessed—fitly close this grand historical panorama, in which on ev-

ery side and at all times we are confronted by entrancing phenomena, arousing all our interest.

From out of this superabundant wealth of accumulated materials I shall select particularly the rise of the people of Israel and of its national organization; and as a legitimate ground for this preference of mine I may remark, that it accords perfectly with the predominant trait of our century and of its science, to investigate precisely the origins of organisms, and to explain all the most hidden processes in the life and action of nature; for the nations of the earth may likewise be regarded as organisms. Still, my principal motive in choosing this part of the subject was the hope of being able to contribute, regarding this very epoch, results which are least known. In fact, since the grand work of Heinrich Ewald, signaling an epoch in these researches, science has not achieved more for any era of the history of the people of Israel than for the history of its primitive existence. Our present subject, accordingly, expressed in popular language, will embrace the period from Abraham to David, as related in the five books of Moses and in those of Joshua, Judges, and Samuel.

The usual exposition is to the effect that Abraham went forth from the land of Haran into Canaan in order to settle there. In the fourth generation after him his descendants migrated to Egypt. In the latter country they led for a long period a quiet and peaceful life until the unbearable oppression of the Egyptians drove them out of the country. Their leader, Moses, by birth a Hebrew, yet thoroughly imbued with Egyptian culture, led them through the desert and across the peninsula of Sinai, back to the land of their fathers. Moses conquered the land to the east of the Jordan, Joshua the land to the west of that river; the latter exterminated almost entirely the Canaanite population and allotted the land as untenanted possessions to the Israelites. Thereupon twelve judges in succession wield the supreme power of the people, until finally the national kingdom arose in the person of the Benjamite Saul, which, in the person of his successor, David, is transferred to the house of Judah.

It cannot be denied that this was the prevailing idea, as early as the time of the Babylonian exile, when the historical books of the Old Testament were for the first time subjected to a comprehensive revision; and

to-day, in fact, the Books of Judges, Samuel, and Kings lie before us, upon the whole, in this shape.

This version is a relatively recent one, having arisen at a period when living historical tradition no longer afforded information. The oldest written sources, having by a fortunate chance been only slightly digested, and thus preserved in all substantial features, were incorporated in the great historical collection and give a widely different picture of the earliest history of the people of Israel.

At this point, there arises the unavoidable question whether, generally speaking, we are permitted to regard these oldest traditions of the people of Israel as history in the strict sense of the word. Not before the exodus from Egypt can we speak in a strict sense of a history of the people of Israel. All that lies before this point of time may be characterized as prehistoric or primeval. Only in the first Book of Moses, the book of Genesis, is information to be had of this prehistoric or primeval era.

Even regarding Moses as the author of the five books that bear his name, yet concerning this remote epoch, separated from his own by a series of centuries, Moses himself would have had to resort to oral hearsay and tradition. It was impossible for him to report these things as an eye-witness. But it is now generally conceded that Moses cannot possibly be the author of the books named after him. These books have rather originated from the comprehensive digestion of a whole series of independent written sources, of which the oldest cannot be older than King Solomon, nor yet much later, and written consequently between 900 and 850; thus between them and Moses there is an interval of several centuries. Only a few scattered sections in the Books of Judges and Samuel, and a few poetical fragments from the five Books of Moses might be older; any comprehensive and coherent historical work earlier than 900 cannot be proved.

The memory of the past, accordingly, has been handed down substantially through the medium of oral tradition; the Israelitic nation itself is the author of these historical narrations, to which the biblical narrator, in giving them a permanent written form, has only imparted a finer psychological character and the magic of his unsurpassed art of representation. The material contents, the ingredients of these narrations, must be regarded from the point of view of popular tradition, of legend.

What is legend? Its main characteristic, of course, is popularity. Legend is a natural product, unaffected by tendencies, an unconscious poetry; and moreover it is characteristic of legend that it does not invent its material but that it embellishes extant tradition with poetic imagery; legend, like ivy, winds itself

about cold matters of fact, often resistlessly overpowering them and flourishing in rank luxuriance, yet not able to thrive without them and unsupported by them.

Legend and history, therefore, are not contradictions, but advance together in brotherly harmony; the legend, from its very nature, presupposes an historical substratum. Only traditions that are attached to some definite locality, some definite monument, or name, are to be regarded as exceptions to the truth of these remarks; traditions of the latter kind adhere exclusively to the locality, monument, or name that they are intended to explain; instead of an historical they here have a material substratum, and even in these instances, they still have a substratum; the legend always stands with firm, marrowy frame upon solid and durable soil, and not with uncertain foothold touching the stars, a play to wind and wave; and on this ground, precisely, we are, in my opinion, altogether wrong in looking upon legend with an exaggerated skepticism.

Legend bears a resemblance to the youthful memories of man. The child will not retain everything, but only distinct events, and not always the most important; but what it does retain it retains firmly. And above all the child will never be mistaken as to the total character of its childhood. A man who has spent a cheerless youth will never imagine that he has been a merry, happy child; a man who has been raised in a village or among the mountains will never believe that he was born in a large city or on the plain. The youthful reminiscences of nations must also be judged according to this same analogy. The ready-made, artistically complete, and finished shape that these reminiscences have assumed on the lips of the people, or of any great poet, is to be called legend and, as such, the result of unintentional poetic creation; but, on the contrary, its historical substratum and the basic character of the whole must be regarded as authentic tradition.

It shall be my endeavor to sketch in brief outline the character of the historical substratum underlying the oldest traditions of the people of Israel, and to show how upon this basis may be erected the true course of the early history of this remarkable people.

FACTS AND TRUTHS.

BY W. M. BOUCHER.

THOUGH, as compared with his theological antagonists, Col. Ingersoll is like a "light shining in darkness," a glowing meteor rising above the horizon of irrationalism, superstition, ignorance; and as day banishes night, so his luminous sentences drive out from the region of the mind mists and mysticism, ghosts and hobgoblins innumerable; yet he shows that he him-

self has not reached to full appreciation of science; has not compassed its real significance, nor understood fully its methods. I am here taking for granted that so great, brilliant, and successful a critic, so "free a lance," as the Colonel is, will not object to be himself criticized.

The Colonel intentionally and professedly ignores and repudiates much of what the scientists — all the scientists — hold to, and much of what is the most essential element or process in science as a method. He almost wholly ignores and repudiates the words "law," "principle," "truth," in a scientific sense (though he is not consistent with himself here), and affirms that the word "fact" covers the ground. He claims that there is no difference between the words "fact" and "truth," that there is no such thing as law, in the sense which scientists use it (no natural laws), and that we should not speak of laws as causes to effects or of causes at all, though he himself is fond of using the phrase "laws are this side the facts," meaning thereby that we do not discover the law until after we have observed and considered the facts. And, admitting thereby, it will be seen (but he does not seem to see), that there is the law nevertheless. Besides, though we do not discover the law until after we have considered the facts, this does not prove that the law is not behind, beneath or in the facts, and much less does it prove that there is no law.

Indeed, the most distinguishing difference between an ignorant and uncultured mind and an intelligent and cultured mind is, that the former sees only the facts or phenomena, while the latter sees not only the facts, with the physical eye, like the other, but penetrates or sees with the mental eye beyond the facts and into their relation, and therefore their meaning and their significance; in other words, discovers their law or laws. For "law is an invariable relation between variable phenomena."

If the Colonel had learned enough of science to have learned this, he would not have undertaken the implied criticism of the scientist for using the word, which he does when he insists (and he does so insist, as I learned in conversation when taking him to task), upon saying "fact of gravitation," instead of law of, or even truth of, gravitation. And see what company he classes himself with in thus insisting upon seeing no further and deeper than this mere surface view of fact.

I am all the more surprised at the Colonel for his not having corrected this error — this stupendous error — after having read (which I know he has read by what, in his discourses and writings, I have noticed) the description of these two classes of minds in relation to these subjects of fact, law, truth, principle, etc., in an article entitled "Public Spirit as a Measure of Manhood."

Now, I submit that there is scarcely a proposition amid all the barren dogmas of theology (which he so brilliantly and successfully attacks) more short-sighted, superficial, irrational, than this one, that facts cover the whole field of our research; that a knowledge of facts is all we know. Irrational I say advisedly. (And how strange it is that so great a rationalist should be so irrational.)

For if we stop with the observation of facts (and by observation is the way we come to a knowledge of facts), we fail to give any scope to our reason, to exercise it at all. And in thus failing we, of course, will not and cannot discover or come to any knowledge of law, and, therefore, of science. We cannot have science without "superadding reason to sense" (observation.) Those who understand science or scientific methods know that we observe facts and infer laws, which inferring means, or is, reasoning. And so the truth is that by far the greater part, and by far the higher, of our knowledge is inferential—that is, rational—which particularly distinguishes man from the brutes and the cultured from the uncultured.

Now, this is the way in which the Colonel has got into such a muddle about laws and science. He has taken the scientists' word law to mean a sort of entity, a thing in itself, such a meaning as was at one time given to the word disease, when it was spoken of as an entity which entered the system and was to be driven out again in order to cure the patient. But, had he seen fit to give as much attention to the constructive as he has to the destructive side of reform, he would have long ago learned that no such meaning is any longer given to the word law, and that this sort of personification of what was but a relation is a remnant or survival of the "spirit of the time" when men were wont to personify all of the forces or laws of nature.

No, my courageous, noble brother, do not worship facts. They are poor, superficial, naked things. Don't let their ostentatious claims and noisy presentation of themselves impose upon you. The babbling, noisy brook is likely to be a shallow one. What's most apparent is generally not the most real. "Appearances are deceitful."

Your worshipping facts is a reaction, and the other extreme from the worshipping of those personifications called gods. Rather worship truth than fact, for it is a much greater and grander thing. One truth may compass a myriad of facts. Facts are fleeting and changeable. Truths or laws or principles are immutable and therefore wholly reliable. In fact, upon the immutability of law depends the possibility of science. And it is the doctrine of rationalism itself that science is the only canon of truth. Science is the means and truth the end. The practice of truth the means and salvation or happiness the end. Facts are on the plane

of our mere animal senses. Truths are on the plane of the most exalted parts of our being.

But I am not, in all this, by any means ignoring facts. They are the necessary foundation of this grand and high-reaching structure called science. But, as facts, they are as inferior to the completed structure of science as the pile of loose bricks is to the perfected building. So we are not like those of whom you so justly complain, the theologians, in that we do not ignore the facts, although (unlike them) we do so exalt reason, and somewhat unlike you, we do say that all our knowledge would not amount to much without reason, inference, law, truth.

Science is, say, "a body of organized phenomena (facts), so arranged as to exhibit the law by which they are governed (or attended) in their relations of interdependence."

But the Colonel objects to the word "cause." But would not he be one of the first to claim that all our knowledge is at best but relative? And could he therefore insist that there is no justification, either for the sake of elucidation or otherwise, for the use of such a juxtaposition of words as "cause and effect," and no real scientific or valuable meaning in them when so placed or joined? If so, then, like the most of people, the Colonel, too, must have a "bias." And it looks to be more than an anti-theological bias.

I would that our brave, sincere and earnest brother would not only be almost, but altogether, persuaded to be a—no, no, not that—a scientist, and so a constructionist, instead of, or as well as being, a destructionist. He has splendid capabilities for such a calling. We are agreed in challenging the soundness of the proposition that "an honest man is the noblest work of God," for the reason of the assumption that is involved therein (not that we don't think an honest man a noble thing.) Let us also agree in believing and maintaining that the "noblest works of man are the discovery and application of truth"—not facts; facts are not "discovered."

THE SITAHARANAM; OR, THE RAPE OF SITA.*

AN EPISODE FROM THE GREAT SANSKRIT EPIC "RAMAYANA,"
ATTRIBUTED TO VALMIKI.

TRANSLATED INTO ENGLISH BY PROF. ALBERT H. GUNLOGSEN.

INTRODUCTION.

The *Mahabharata* and the *Ramayana*, as is generally known, are the two great epic poems of the Aryan tribes that settled in India. The *Mahabharata* describes the prolonged internal struggles of the Aryan tribes, supposed to have taken place about the time

when they had reached the banks of the river *Yamuna*, and of the upper *Ganges*. The *Mahabharata*, accordingly, exhibits the picture of endless battles between the Aryan tribes themselves, and displays all the manly generosity, chivalry, as also the more dangerous passions that characterize the earlier stages of any tribal and national development.

The *Ramayana*, on the contrary, belongs to a much later period, when the religious and social institutions of the Aryas had considerably weakened and modified their self-assertion and energy in their motives, and outward manifestations. The "*Sitaharana*", that is, "the Rape of Sita," is generally admitted to be one of the most touching episodes, contained in the *Ramayana*. The *Ramayana* describes the high feats of the Indian prince *Rama*; while the scene of his exploits is laid in Southern India (Southern *Deccan*) and in the Island of *Lanka*, or the modern Island of Ceylon, both of which are supposed to have been conquered, and colonized by the Aryas about 500 years before Christ.

The Aryan tribe of the *Koshala* had originally settled on the banks of the river *Sarayu*; and here in the beautiful city of *Ayodhya* (the modern Oude), is said to have resided the old king *Dasaratha*. This king had three wives, of the names *Kausalya*, *Sumitra*, and *Kaykeyi*. The first wife bore him *Rama*; the second, *Lakshmana*; and the third, his youngest son *Bharata*. The king, when grown old and infirm, wished to crown his oldest son, *Rama*; but *Kaykeyi*, the third wife, opposes his will, and demands that her own son *Bharata* should be crowned, and besides that *Rama* be exiled for a period of fifteen years. In vain the old king entreats her to desist from her cruel request. She obstinately refuses; and, as the king on a certain occasion, in the fulness of his kind heart, had promised to grant her any first two requests she might demand, he is accordingly compelled to accede to her wishes. *Rama*, on his part, forthwith obeys, and sets out accompanied by his young wife *Sita* and by his half-brother *Lakshmana*, king *Dasaratha*'s second son.

Such was the legendary origin and motive of prince *Rama*'s expedition against the swarthy, aboriginal population of Southern India; and at this juncture also the *Ramayana* displays the leading features, characterizing, and pervading the whole poem. *Rama*, namely, in a passive manner obeys the unjust sentence, and in the same submissive spirit, valor, self-asserting independence, with every other manly quality, are throughout this poem, in each instance presented as purely secondary to filial attachment, to passive obedience, humility and self-denial. *Rama*, accordingly, is a kind of observant knight of the Temple, or what the Germans would call, "ein Tugendheld."

*The Hindu proper names are here spelt in ordinary English characters. Their correct transcription, according to the usage adopted by Sanskrit scholars is as follows: *Mahabharata*—*Mahābhārata*; *Ramayana*—*Rāmāyana*; *Sitaharana*—*Sitāhāraṇa*; *Sita*—*Sītā*; *Rama*—*Rāma*; *Koshala*—*Kośala* (a tribe); *Dasaratha*—*Dacāratha*; *Sumitra*—*Sumitrā*; *Dandaka*—*Dandakā*; *Lankā*.

This moreover shows, that the Ramayana, in its ultimate form, was recast at a period, when the proud Kshatrya, or warrior caste, had at last definitely bent its neck under the controlling yoke of the sacerdotal caste of India.

Rama's pure-minded wife Sita also renounces all earthly comfort, to follow her husband; and the brotherly attachment is illustrated in Lakshmana, who accompanies them. Rama, indeed regrets, that he shall no more go a hunting on the charming banks of the Sarayu; but he forgets his own troubles, when his beloved Sita wants him "to tell her the names of all the strange plants and flowers they meet with."—In this manner the Brahmanic, or sacerdotal influence, has strongly asserted itself in the Ramayana; not merely in the motives, but also in the means, through which the aboriginal population of Southern India was vanquished. All those high feats are performed by a single man, and his arms are divine weapons, created by the supreme god Brahma himself; and, accordingly, mere human valor and virtue are forcibly thrust into the back-ground, or reduced to diminutive proportions.

Rama settles in the wood of Dandaka, which begins on the southern bank of the Ganges, and his hermitage is called Janasthana. Here he is said to have alone killed the prodigious number of fourteen thousand Rakshas that is, fiends, demons, giants, by which names must be understood the aboriginal Dravidian population of Southern India, the swarthy Bhillas, and Gonda-tribes. On this account Rama naturally arouses the bitter resentment of the powerful Rakshasing Ravana by name, the ruler of Lanka, or Ceylon, "the fairest isle of the ocean." One fine day the wily Ravana devises a plan for carrying off Rama's wife, Sita; and this forms the subject of the Sitaharana, which I have attempted to paraphrase, rather than translate literally into the English language.

Classical Sanskrit, *viz.*, the main bulk of Sanskrit literature has no prose, but in every department, even in science and philosophy, adopted a metrical form. Hence all extant European translations from Sanskrit literature unavoidably display the hybrid character of both translation and paraphrase. Those who are acquainted with Sanskrit syntax well know, that without the latitude allowed by both paraphrase and the genius of the Sanskrit language, Sanskrit literature would be highly unattractive to most European readers. Without violating the original text in any essential particulars, it was necessary for the popular purpose of the paraphrase to depart in several instances from the literal meaning of certain epithets and allegorical similes, contained in the Sanskrit text. My translation, hence, simply aims at being a readable paraphrase of a highly poetical episode, that certainly deserves to be known to all men of average culture.

At the opening of the present episode the dusky king Ravana orders a Raksha of his subjects, Maritcha by name, to execute his design, by transforming himself into a golden stag, for the purpose of enticing away from the hermitage the two brothers, Rama and Lakshmana. The plan is successful, and poor Sita falls an easy prey to Ravana. Her constancy, however, and devoted attachment to her husband are touchingly illustrated in the last chapters of the Sitaharanam. To this very day Sita has remained the most exalted pattern of conjugal fidelity and an interesting type of noble Hindu womanhood. But I must also add, that her faith was ultimately rewarded by a happy and pleasant sequel.

A kind, black devil, Hanuman by name, described as the king of all monkeys, informs Rama of Sita's whereabouts; and with the assistance of the aforesaid king, Rama recovers Sita. They bridge the sea between the continent and the island of Lanka with huge rocks, and attack Ravana in his own stronghold. Rama in battle encounters the chariot of his foe, and they fight long, very long, until, on the seventh day, Rama fells Ravana, "the swarthy, fierce-eyed king of the Rakshas, in blood-red garments, with ear-rings, necklace and bracelets of gold."

Sita, through a trial of fire, proves that all the while she has been faithful to Rama; and, as now the fifteen years of exile in the wilderness have at length expired, they all return to the beautiful city of Ayodhya, where in peace and plenty Rama and Sita reign many happy years.

THE COMING RELIGION.

BY CHARLES K. WHIPPLE.

IN ancient times, dissent from the theological ideas then generally accepted received not only the extremity of popular indignation, but condemnation to the severest penalties by the civil ruler. Increasing intelligence and the advance of civilization have materially changed that state of things, and now every article of theology and religion is freely discussed, sometimes even in an irreverent and contemptuous manner. We maintain, however, the right of free inquiry and discussion; considering the occasional abuse of it a less evil than the governmental suppression of it. It may be worth while to consider what features of religious belief are likely to hold their ground against hostile criticism, and to remain permanent features of the religion of the future. Such I consider to be the five following, namely:—God, Immortality, Duty, Responsibility, Retribution.

1. *God.* The devotees of science generally admit a manifest purpose in that which we call collectively Nature. As it is difficult to conceive a purpose without a purposer, we can escape the absurdity of referring ourselves and our habitation to chance only by assum-

ing the existence of God; and as religionists agree with agnostics in admitting this supreme power to be past finding out, we may rationally believe in Him without comprehending Him.

2. *Immortality.* The existence and action of God being assumed, it seems absurd to suppose that He would have given such capacities to human beings without giving opportunity for all to expand and develop as a few have already done. So large and elaborate a foundation implies an intended superstructure. It seems reasonable, as John Fiske has said, to feel entire confidence in the reasonableness of God's work. It must be that He will give opportunity in another state of existence for the development of those wonderful and admirable faculties which, richly manifested in a small minority of human beings, remain latent in the vast majority, as far as this world is concerned. Therefore, we shall continue to live after the death of the body.

3. *Duty.* We cannot comprehend God. But since the works which (to avoid absurdity) we must attribute to his purpose and action, are great beyond our conception, and since that purpose and action are in many things manifestly good, perhaps the aspects of nature and humanity which seem to us not good, seem so in consequence, partly of our limited powers, and partly of the small portion of time allotted to us here and of our ignorance of God's purposes in the future. Perhaps the whole plan is as great and good as parts of it now appear to our imperfect vision. In that case, it is rational for us to ascribe perfect goodness (what the Hebrew prophets called righteousness) to the author of our being, and to assume our moral obligation to coöperate with Him by being good and doing good to the extent of our ability. If God be really such as I have supposed, we must recognize a duty of attempting such coöperation with Him as may assist his purpose of promoting human welfare and happiness.

4. *Responsibility.* If duty really thus binds us to God as a Father and to human beings as brothers and sisters, failure in either department of this duty must, sooner or later, prove injurious to ourselves. He who chains another, necessarily feels one end of the chain weighing upon and encumbering himself. The still, small voice of conscience, reproaching us for wrong-doing, is as manifestly a part of human nature as any other part of it, material or spiritual; and it is reasonable to suppose that the invisible Power whose voice we thus hear has the right so to reproach us, as well as authority to hold us to account. There is every reason to believe that we are responsible to God for the right use of the life He has bestowed, and the opportunities He has given us.

5. *Retribution.* What we call justice, administered by public functionaries, fails of accomplishing its pur-

pose in great numbers of cases for want of wisdom or goodness or power sufficient for the purpose. But if there be a Ruler of mankind perfectly wise and good and just and powerful, whose plan includes the government of men after this world as well as in it, it is a matter of course that He will render to every man according to his works. So much faithful obedience, so much welfare. So much disregard or violation of known right, so much necessity of painfully retracing our course to the point of deviation, and then beginning a return to the right road. So much wilful injury to a fellow creature in this life, so much service applied to his benefit in the next. The perfectly just and good Ruler will necessarily arrange and accomplish this work of rendering to each of his subjects according to his works.

But when the perfect Ruler is also a loving Father to each one of his subjects, a new and most important element comes into the case. The retribution for evil-doing must then contemplate and provide for the ultimate welfare of the evil-doer. The first element of welfare to such a person must be his reformation, and whatever suffering is essential to such reformation must on no account be remitted. So far as the offender is wise, he will see the advantage of not only submitting to this discipline, but of coöperating with it and making every effort to reform himself. If, however, he is stupidly obstinate, and determined to persist in error, the consequence to him must be a continuance of failure, defeat, and suffering. Eternity is before him, with endless opportunity of repeating the experiment, of trying to gain advantage by wrong-doing. How long will he hold out? The Ruler who must render to him according to his works, the Father who is demonstrating to him by experience the certain ill consequences of ill-doing, can wait as long as he can. The contest is unequal. Sooner or later, supremewisdom and goodness must certainly prevail, and the rebellious subject, the prodigal son, will repent and return. The character of God being such as we ascribe to Him, it is absurd to suppose that his administration will fail of its purpose; absurd to suppose that his justice and love, working in concert, will not ultimately accomplish the welfare of every human being by accomplishing his reformation.

The idea, then, of escaping the consequences of evil-doing by obtaining pardon through an intercessor is an utterly erroneous one. To request that the wrong-doer should not be worse off for his offence, or that another should suffer for the wrong instead of himself, would be to request a reversal of God's method of moral government. The only right course for the offender is reverently to submit himself to the law, to accept its penalty, and to keep himself thenceforth in the line of its requirements.

GOD, FREEDOM, AND IMMORTALITY.

MR. CHARLES K. WHIPPLE in his essay, "The Coming Religion," considers five features of religious belief, which as he hopes, are likely to hold their ground against hostile criticism. He names the ideas God, Immortality, Duty, Responsibility, and Retribution. Mr. Whipple's arguments are in the main similar to those proposed by Kant in his Critique of Practical Reason.

Kant showed in his Critique of Pure Reason that the ideas Soul, World, and God are 'paralogisms of pure reason.' We can arrive at these concepts by a logical fallacy only. We may nevertheless, he declared in his Critique of Practical Reason, retain these concepts, because they are of greatest importance for our practical and our moral life. If we act as if we had no soul, and as if no God existed, we are more likely to go astray than if we act as if we had an immortal soul and as if a God existed—a God, a just and omnipotent judge, who will reward the good and punish the evil.

Upon the need of morality he builds an ideal world, the foundations of which are the ideas of *Freedom* (including moral responsibility), *Immortality*, and *God*. Being fully conscious of the fact, that these ideas are not provable, Kant called them "the three postulates of practical reason."

The conflict between Pure Reason and Practical Reason proves that in Kant's philosophy traces of Dualism are preserved which lead him to incompatible assertions. He boldly and honestly lays down the inconsistency of his philosophy in his four "antinomies," or contradictory statements. Popularly expressed, they are:

THESIS.

1. The world is limited.
2. The soul is a simple substance, and therefore immortal.
3. There is moral freedom distinct from the law of causality.
4. There is a God.

ANTITHESIS.

1. The world is infinite.
2. The soul is a compound, and therefore destructible.
3. There is no freedom, but all is subject to causality.
4. There is no God.

Kant believes that the arguments to either issue, the positive or the negative, are of equal weight. Thesis as well as Antithesis, he declares, can be defended or attacked with equal force.

Is it not strange that a great man can fall into so great an error—an error that is at the same time so palpable? Of two statements that are contradictory, one only can be true. It is impossible that both are right, or that the arguments of either are correct. Yet it is possible that both are wrong, that the formula-

tion of the dilemma is radically incorrect,—and such is the case with Kant's antinomies.

We resolve the four antinomies into the following statements, which cannot be said to be contradictory.

1. Space (which is no object, no palpable thing, but merely the possibility of motion in every direction) is infinite. Yet the world, although immeasurable to us consists of a definite amount of matter and energy which can neither increase nor decrease.

2. The soul is a compound of highest complexity and is therefore destructible; but being a compound of a special form, it can be broken and built again. When built again, it can be improved. Souls of a special kind can be formed, and ever nobler ideas can be implanted into souls. Thus the soul—a special compound of living thoughts, living in the organized brain-substance of bodily beings as real nerve-structures—can continue to exist even beyond the death of the single individual; it can be propagated, transplanted, and evolved. And to accomplish this is the main object of human institutions. There is no immortality of the ego beyond the clouds, but there is a continuance of soul-life in this world. The continuance and higher development of soul-life is of vital importance, and the duties of our present lives must be performed, not to please or benefit ourselves but in a spirit such as to enhance the life of the race to come. We must live so that our soul shall continue to live and to evolve in future generations.

3. Freedom and necessity are not incompatible;* but freedom and compulsion are contradictions. If a man is compelled by the authorities of the law to observe the law he cannot be said to be free. But if the law—the good will to live according to the law and the honest intention to act with righteousness—is a part of the man and a feature of his character, he is free while observing the law. The actions of a moral man are necessarily moral; they are the necessary outcome of his free will.

4. The anthropomorphic idea of God as a transcendent personality is undoubtedly a paralogism of pure reason; but the conception of an immanent God as the cosmical law to which we have to conform in order to live and to continue to live in future generations is no paralogism, no logical fallacy. Such a conception of God is at variance neither with reason nor experience, and there is no atheist who could not be converted to it by rational argument and by a study of nature. This God is not the personified weakness of a benevolent father—the ideal of the deists who would fain make him as sentimental and feeble as they were themselves. This God is the stern severity of order and law—irrefragable and immutable as are all natural

* See the writer's "Fundamental Problems," pp. 191-196, to be published in about a week, and the Editorial of No. 33.

laws, and yet at the same time as reliable and as grand, as sure and eternal—visiting the iniquity of the fathers upon the children unto the third and fourth generation, and showing mercy unto the thousands of those that keep his commandments.

We thus have the three postulates of Kant again, although in another shape. We have no transcendental God, no illusory ghost-immortality, no freedom that stands in contradiction to the law of causation. But we have the immanent God of a moral law in nature; we have the immanent immortality of a continuance of our soul-life beyond death and the moral freedom of responsibility for our actions. The errors that were attached to these ideas are done away with, but their ethical value remains unimpaired. They have ceased to be postulates and have become truths—for now they are no longer paralogisms, they are free from contradictions; they are real, because they represent certain facts of reality which can be verified by experience.

P. C.

SONNET.

BY LOUIS BELROSE, JR.

WHILE yet a child, before the joys of spring
Had come and gone till all were known to me,
I set an orchard out with many a tree
Of goodly stock for plenteous harvesting.
And though the sweet birds came to light and sing,
It seemed the far-off day would never be;
And, heedless of their note, impatiently
I waited for the time of fruit-bearing.
The time has come: the trees are now full-grown;
And o'er my head the branches interlaced
Bear fruits of varied flavor, all my own.
But, nearly in my reach, I let them waste:
While, listening to the bees' unwearied drone,
I sit and muse, and hardly care to taste.

TO THE SOUL.

AN ODE OF EVOLUTION BY W. D. LIGHTHALL.

O lark aspire!
Aspire forever, in thy morning sky!—
Forever, soul, beat bravely, gladly, higher,
And sing and sing that sadness is a lie.
Forever, soul, achieve!
Droop not an instant into sloth and rest.
Live in a changeless moment of the best
And lower heights to Heaven forgotten leave.
Man still will strive.
Delight of battle leaped within his sires:
They laughed at death; and Life was all alive:
In him not blood it seeks, but vast desires.
He wakens from a dream:
Reviews the forms he fought in ages gone—
He or his ancestors, their shapes are one:—
And also of himself the forms he battled seem.
He sees the truth!
"I wrestled with myself, and rose to strength.
Still be that progress mine!—I see at length
All World, all Soul are one, all ages youth!"

CORRESPONDENCE.

POSITIVISM.

To the Editor of THE OPEN COURT:—

KINDLY permit me a word of explanation.

It is true, as you say, that I am a follower of August Comte in his first period, but if I were inclined to hold any one responsible for my conception of the universe I should choose his disciple, Emile Littré.

To use Comte's own words, the initial elaboration of his second great work coincided with a decisive invasion of a virtuous passion for Mme. Clotilde de Vaux, and the result was a nervous crisis that put him in real cerebral danger. (Letter to Mill.)

When, under this influence, he adopted the subjective method and, as he says, "began the new philosophic career, in which the heart was to have at least as much place as the mind itself," Littré staid with the facts.

Speaking of some verses in No. 37, of THE OPEN COURT, you say that you "differ with me concerning the idea of God and have attempted to conceive it on the basis of positive facts." Please do not judge me by those lines. Your conception is about the same as mine, although I do not call mine God.

Respectfully yours,
LOUIS BELROSE, JR.

COMTISTS AND AGNOSTICS.

To the Editor of THE OPEN COURT

IN Mr. Wakeman's article, in a former issue, there is a remark that is decidedly puzzling to one acquainted with the writings of Spencer; and I feel the more constrained to call attention to it, since it opens the way to a general criticism on Mr. Wakeman's paper and the attitude of Comtists toward other anti-metaphysical schools of thought.

The remark is to the effect that the attacks of "Spencer and Co." upon the four corner-stones of Positivism have failed. These corner-stones are enumerated thus:

- a) The relativity of human knowledge.
- b) The classification of the sciences.
- c) The evolution of human history and civilization.
- d) The conception of humanity as a great social, organic being.

Now how any portion of Spencer's writings can be construed into an attack on numbers (a), (c), and (d), I cannot understand. Surely there has never been a more ardent supporter than Spencer of the relativity of knowledge, the evolution of man and the organic unity of society.

I am persuaded that Mr. Wakeman intended that the "attacks of 'Spencer and Co.' upon these corner-stones" should refer only to (b). This has undoubtedly been assailed by Spencer; with what success need not here be discussed. For this "corner-stone" is plainly not one on which the superstructure of the "Religion of Humanity" rests in the least. What possible difference can it make to that religion whether in our hierarchy of the sciences we introduce the division of "abstract-concrete," or deny the possibility of a linear arrangement?

Mr. Wakeman's placing this as a fundamental doctrine of monistic religion is, however, quite in accord with the custom of Comtists in general; and suggests the general criticism first alluded to. For is it not this insistence by Comtists on unessentials that has kept agnostics away from the Religion of Humanity, rather than a spirit of "envions and idle criticism"? Agnostics, even though agreeing with Spencer in regard to the worship of the Unknowable, believe also in the necessity of an ethical religion, and would gladly join hands with positivists in forwarding it. But they are so persistently met with this demand that they should give

assent to unessential Comtean dogmas, hail Comte as their High Priest, and confess that to him they owe their emancipation from mysticism, that union is rendered impossible.

Surely it is very unfortunate that agnostics and positivists, whose differences are slight compared with their fundamental agreement, should not be able to unite in common work for humanity; but Mr. Wakeman has only strengthened my conviction that agnostics cannot be held accountable for the continued separation.

R. F. SMITH.

SARANAC LAKE, N. Y.

PHILOSOPHY AT MONTREAL.

To the Editor of THE OPEN COURT:—

"DEAR Correspondent," writes one, "tell us a little more of that interesting circle of friends who meet fortnightly to read and discuss together philosophical topics."

In reply, I might say something of what might be called an exceptional evening—one spent in listening to an able essay on the Transcendental Philosophy of New England: the Emerson period. By courteous invitation of the scholarly lecturer, members of the club assembled in his delightful and spacious study on the evening appointed. The first half hour was spent in examining photographs of the literary celebrities of that interesting epoch. The essay occupied an hour or more, the lecturer delivering it in his usual calm, clear style, emphasizing the more important parts, and pausing occasionally to give his audience a chance for a moment's reflection. Toward the end of the lecture, something was said about the disastrous failure of the Brook farm experiment—as seen from a financial point of view. As the lecturer concluded, 'Metaphor' enquired of him with something of an anxious tone.

"And do you think the dream must always be a failure—from what is called the 'practical' point of view?"

"I hope not," answered the lecturer, in grave if not hopeless tone, and Metaphor's optimism was evidently unsatisfied.

Opposite the essayist sat 'Greek.' 'Greek' took up the argument immediately, and in firm voice, and interestingly broken English, said:

"I am quite sure that the dreamer and the worker are two, and must always be two. The thinker has enough to do with his thinking, and the doer has enough to do with his doing, and both fail when they take up what belongs to the department of the other. The dreamer will always get the pail on the wrong side of the cow, and the milk will always be spilled—just as we hear was the case at Brook farm. When I teach my Latin and my Hebrew and my French, I am often that tired and my head aches, and I cannot go and plant and dig."

"Ah, but," said 'Metaphor,' laughing, "if you had taught Hebrew and Latin for perhaps two hours, and then rested your brain by doing an hour's gardening, it appears to me you might have saved time in the end, by escaping a headache. Why should not the worker learn to work thoughtfully, and the thinker learn to think healthfully? At the present day dreamers and workers, both, are drudges, and why? Because there is an unnatural separation between the two sides of life. With a more advanced civilization I anticipate that brain and hand-work will be so judiciously intermingled that both shall be done pleasurable as profably—that is, *wholesomely*."

"No, no," 'Greek' broke in, "I speak because I have tried; and if I worked at the garden after my Hebrew, my head ached more than ever. I—"

But at this point the clock, inconsiderately, struck ten, and the philosophers dispersed. Perhaps THE OPEN COURT will help them to settle the unsettled question. 'Metaphor' quotes in defense of his solitary position Emerson's words,—*One must believe one's own thought*.

Thomas Aquinas and Scholasticism, was the subject of last meeting. 'A biographical sketch of the 'angelic doctor' arrived just at the right moment from our Scottish correspondent, under the signature "Scotch Mist." The prelude is characteristic of the writer:

"Fain would your Scottish correspondent go to sleep until the next century, if assured that his fellow philosophers would also do so and waken at the same moment. By that time, as he has heard from good authority, that marvelous instrument, the phonograph, will be in perfection, and in daily use. Then will Progress, Mystic, Metaphor, Commentator, and their compeers 'do their thinking aloud' and brighten the dullness of their far distant cousin, *Scotch Mist*. Said *Mist* is noted for absorbing all that comes, only to be lost in colorless, shapeless vacuity. Not altogether, nor hopelessly, however. As a metaphysician he believes there is something hidden beyond the visible; as a philosopher he loves to search out wisdom, to ponder upon the mysteries of consciousness, this inscrutable *ego* which dwells within and mocks all efforts to define it."

MARY MORGAN (Gowan Lea).

MONTREAL, April, 1889.

ABSOLUTE EXISTENCE.

To the Editor of THE OPEN COURT:—

ALLOW me to ask you the explanation of a sentence I read in your paper: "Agnosticism and August Comte's Positivism." You say: "The errors of ontology and the belief in absolute existence." * * * The Monistic Unity of our Monism, (*Monos*), is it not the ENS, "absolute existence," the absolute substance of which noumena are the different aspects, and of which phenomena or "matter" are only the *sensed* manifestations? In that question is the only cloud that is obscuring to me a point of our beautiful monistic sky.

P.

The answer to this question is contained in the editorials of Nos. 82 and 83, "Phenomena and Noumena" and "The Oneness of the Phenomenal and Noumenal."

The word *phenomena* is derived from φαίνεσθαι, to appear, (φαίω, to show; φάω, to shine) and means "appearance." It is now used in two senses: 1) appearance or unreal illusion; and, 2) natural phenomenon. The two meanings exclude one another. The former is mere appearance or unreal semblance, the latter the fact of experience or the reality that is "sensed." Phenomena, in the sense of the latter explanation, are the basis of all knowledge and philosophy. They are the positive existences of nature.

Noumena, (or thought-existences,) are concepts of an abstract nature. The idea of goodness or virtue is a noumenon. Virtue does not exist corporeally as an absolute being, or as a concrete object like a table or a tree. Virtue is nevertheless a reality. It does not exist as a body of itself, but it exists as a real quality in bodies. We, in our mind, abstract the quality of goodness and call it virtue. Noumena, therefore, are not things, and not objects, or bodily entities, but, if they are true, they represent real qualities of bodily entities. If there are no realities that correspond to them, they must be looked upon as mere illusions, but they are of greatest importance in so far as they afford us the possibilities of a higher, a human, and humane life. The noumenal world of thought is the foundation of man's rational existence.

The idea of absolute existence, of the *Ens*, the *monos*, or whatever it may be called, is a noumenon, an abstract conception which embraces all facts of reality under the aspect of their inseparableness. But there is no *monos* of itself; there is no "absolute existence" that exists like a thing. The facts of reality are never absolute, never abstract, they always are definite single objects of experience.

F. C.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXVII.

ILSE'S FLIGHT.

ILSE was awakened by her husband's parting kiss; she sat at her bed-side and listened to the sound of the rolling wheels.

"This has been a fearful night," she said; "after tears and anguish there came bad dreams. I was hanging over a precipice; from the depth below, concealed by fog, arose the noise of a waterfall. Felix standing above, held me by a handkerchief; his strength was giving way; I felt that, but I had no anxiety about it in my dream. I wished that Felix would let me go, and not sink with me. Pass away in peace, my dream, to thy portals of ivory; thou wast a good dream, and I have no cause to be ashamed of thee.

"He is on his journey, and I am alone. No, my Felix, you are with me, even when I do not hear your voice. Yesterday I was angry with you; I am sorry for it. I bear you within me, just as you have taught me, that the soul of man passes into and rests in others. That part of Felix which I preserve within me I will keep honorably, and quietly cherish in this hateful house."

She opened the curtains.

"It will be a gloomy day again; the finches are already sitting at the window, crying for the dilatory woman who has slept beyond the breakfast hour of her little ones. Outside all is in bloom, and the large leaves of the Schubart-plant blow about joyously in the moist air. But this rain will be more than my father likes; the seed will suffer. The good God cannot please us all at the same time; we are indeed covetous.

"At home they gossip about me; my neighbor did not say the worst that she knew. I have not been used to this. When I became the wife of my Felix I thought myself raised above all the meanness of the world, but I now feel its sting in my soul."

She passed her hand over her eyes.

"No tears to-day?" she cried springing up. "When my thoughts course wildly through my brain I will prove to myself that I have something of the scholar's character in me, and will calmly look into my own heart and quiet its beatings by prudent reflection. When he first came to our house, and the noble spirit of his conversation aroused me, his image pursued me into my room. I took a book, but I did not know what I read; I took up my accounts, but I could not put two and two together; I observed that all was confusion within me. Yet it was wrong to think thus about a man who was still a stranger to me. Then in my anguish I went into the nursery, tidied all my brother's

and sister's things, and saw whether the boy's clothes needed mending. I was then a regular home body. Ah, I am so still; I hope it will help me now. I will put all my things together for I feel as if should take a journey to-day, and that it will be well to have all prepared."

She opened the closet, drew out her trunk, and packed it.

"But where to?" she asked herself. "Far away? How long it is since I had wings like a swallow, and could gaily fly with my thoughts into foreign parts! And now the wings of the poor little swallow are broken. I sit alone on my branch; I would gladly conceal myself in the leaves, and I read the fluttering and the chattering of my neighbors."

She supported her weary head with her hands.

"Where should I go to?" she sighed; "not to my father; nor could I now look with pleasure on mountains and old monuments. How can one have a fear for the forms of nature and the achievements of past nations when one's own life is racked and disturbed?"

"My Felix said that one should always consider oneself the child of the whole human race, and be elevated by the high thought that millions of the dead and living are united to us in an indissoluble unity. But who of those who were and are about me will relieve my tormented soul of the pangs that constantly trouble me? Who will deliver me from dissatisfaction with myself and from fear about the future? Ah me! It may be a teaching to inspire man in hours of exaltation, when calmly contemplating all about him, but for him who is writhing in torment and affliction, the teaching is too high, too high!"

She took from the shelf her little Bible, which had been given her by the good Pastor on her departure from her father's house, and drew it out of its cover.

"I have long neglected to read you, dear book, for when I open your pages I feel as if I had two lives; the old Ilse revives who once trusted in your words; and then again I see myself, like my husband, criticizing many passages, and asking myself whether what I find in you is according to my reason. I have lost my childish faith, and what I have gained instead gives me no certainty. When I fold my hands in prayer, as I did when I was a child, I know that I dare pray for nothing but strength to overcome, by my own exertion, what now casts down my spirit."

The gardener entered the room, as he did every morning, with a basket of flowers which the lord of the castle sent her. Ilse rose and pointed to the table.

"Set it down," she said, coldly, without touching the basket.

She had, at other times, frequently expressed to the man her pleasure in the beautiful flowers he had cultivated. It had always given him pain that the

* Translation copyrighted.

illustrious personages of the castle never noticed his rare plants, and he had been so pleased with the warm interest taken by the strange lady that he brought the flowers every morning himself, and pointed out to her the new favorites of the conservatory; he had cut for her the best he had.

"The others do not notice them," he would say; "and she remembers the Latin names too."

He now placed the basket of flowers down with a feeling of mortification.

"There are some new specimens of the calceolaria," he began, reproachfully; "they are of my own raising: you will not see others of this kind."

Ilse felt the disappointment of the gardener. She approached the table, and said:

"They are indeed very beautiful; but flowers, dear sir, require a light heart, and that I have not now. I have ill repaid your kindness to-day; but you must not be angry with me."

"If you would only look at the grey-spotted ones, exclaimed the gardener, with the enthusiasm of an artist; "these are my pride, and are not to be had anywhere else in the world."

Ilse admired them.

"I had taken great pains for many years," continued the gardener. "I had done all I could to obtain good seed, but only common ones came; after I had almost lost courage, the new kinds blossomed all in one year. It was not my art," he added, honestly: "it is a secret of nature; she has given me good fortune, and relieved me from my cares all at once."

"But you took pains and did your best," answered Ilse; "when one does thus, one may trust to the good spirit of life."

The gardener went away appeased; Ilse looked at the flowers.

"Even he who sent you has become to me an object of dread. Yet he was the only one here who showed me uniform kindness and treated me with respect. Felix is right: there is no reason for us to be disturbed on his account. Who knows whether he is much to blame for the disagreeable reports about this house. I must not be unjust towards him; but when I look at his flowers, it seems as if an adder lay within them, for I do not know whether his soul is pure or impure. I do not understand his ways, and that makes me uncertain and fearful."

She pushed the basket away, and turned from it.

The maid who waited upon her came into the room, with a troubled countenance, and begged permission to go away for the day, as her mother was very ill in a neighboring village. Ilse asked kindly about the woman, and gave the girl the desired permission, with good wishes and advice. The maid went slowly out of the room; Ilse looked sorrowfully after her.

"Her heart, too, is heavy. It is well that Felix is not at home, for I can now be alone with my sorrow. It will be a quiet day, and this will be welcome after yesterday's storm."

Again there was a knocking at the door; the Castellan brought the letters that the postman had given him for the Pavilion. There were letters from her brothers and sisters who kept up a regular correspondence with their distant Ilse. A ray of joy passed over her serious face.

"This is a pleasant morning greeting," she said. "I will to-day answer my little band in detail. Who knows whether I may have time for it next week."

She hastened to the writing-table, read, laughed, and wrote. Her uneasiness had passed away; she chatted like a lively child in the language and thoughts of the nursery. Hours flew in this occupation. Gabriel brought up and carried away the dinner. When in the afternoon he found her still bending over the letters, he lingered by her and hesitated whether he should speak to her; but as Ilse was so deeply engrossed in her work, he nodded and closed the door.

Finally, Ilse wrote to her father. Again her thoughts became sad, anguish rose from the depth of her heart, and lay like a burning weight on her bosom. She left her writing-table, and paced hastily about the room. When she came to the window, she saw the lord of the castle coming slowly along the gravel path towards the Pavilion.

Ilse stepped back quickly. She was not unaccustomed to the short visits of the Sovereign; but to-day she felt fearful, the blood rushed to her heart, she pressed her hands over her bosom, and struggled for composure.

The door flew open.

"I come to inquire," began his Highness, "how you bear your solitude. My house also has become empty, my children are gone from me, and it is lonely in the great building."

"I have employed my leisure in intercourse with distant friends," answered Ilse.

She would not on this occasion mention the children to the Sovereign.

"Are the little ones who play about in your home amongst these friends?" he asked laughing. "Have the children again expressed their wishes to you?"

He took a chair and invited Ilse to be seated. His demeanor made her more composed; his manner was that of a discreet and well-intentioned person.

"Yes, your Highness," replied Ilse; "but this time my younger sister, Luise, was the most active correspondent."

"Does she promise to become like you?" asked the Sovereign, kindly.

"She is now twelve years old," replied Ilse, with

reserve; she is sentimental upon every subject and every blade of grass excites her fancy. It appears as if she were to be the poetess of the play-room. I do not know how these fantastical ideas have come into our family. In her letter she tells me a long story, as if it had happened to herself, and yet it is only a tale which she has read somewhere. For since I have left my home, more story-books have reached it than were there in my youth."

"Probably it is only childish vanity," said the Sovereign, kindly, "that leads her to substitute an invention for truth."

"That is it exactly," answered Ilse, more cheerfully. "She pretends that she lost her way in the wood, and that when she was sitting sorrowfully among the toad-stools, the little animals whom she was in the habit of feeding in our court-yard,—the white mouse in the cage, the cats, and the shepherd's dog,—placed themselves about her and ran before her till she found her way out of the wood. The cat together with the mouse, your Highness; that was silly! This story she related boldly as if it were the truth, and expected me to think it touching. That was too much—but I have given her my opinion of it."

The Sovereign laughed, laughed from his heart. It was a rare sound that echoed through the walls of the dark room, and the god of love above looked down with surprise on the joyous man.

"May I ask how you criticized this poetic state of mind?" asked the Sovereign. "There is a poetical idea in the tale, that the kindness shown to others will always be repaid when required. But it is unfortunately only a poetic idea; gratitude is seldom met with in real life."

"One ought not, in life, to trust solely to the help of others," replied Ilse, firmly; "and one ought not to show kindness to others in order that it may be repaid. There is indeed a strange pleasure felt when some chord which one has struck brings back its echo to one's heart; but one should not trust to it. A child that has lost its way should make good use of its five senses in order to find its way home by itself. But, certainly, one ought not to put forth poetical ideas as if they were real incidents. I was obliged to scold her; for, your Highness, girls in these days must have right ideas taught them, or they will soon lose themselves in dreams."

The Sovereign laughed again.

Where are the wise and good animals, Lady Ilse, that will give *you* friendly counsel in your time of need?

"You are too strict," continued the Sovereign. "The witch fancy deceives the judgment of even us grown-up people; one is fearful without reason, and one hopes and trusts without justification. The per-

son who could ever command a true, impartial judgment of his own position, would have a freedom that would make life hardly endurable."

"Fancy confuses us," answered Ilse, looking round, "but it warns us also."

"What is warmth of feeling, and devotion to others?" continued the Sovereign, sorrowfully. "Nothing but subtle self-deceit. If I now am flattered by the joyful feeling that I have succeeded in sharing the wealth of your heart, that too is only a deception; but it is a dream which I carefully cherish, for it does me good. With a happiness which I have long been deprived of, I listen to the honest tones of your voice, and the thought is painful to me that I shall ever be without the sweet enjoyment they afford. It is of greater value to me than you imagine."

"Your Highness speaks to me as to a true friend," replied Ilse, drawing herself up; "and when I take to heart the kindly tone in which you now express your sympathy, I have to believe your honesty and sincere intentions. But this same fancy, which you blame and praise, disturbs also the confidence which I would gladly have in your Highness. I will no longer be silent about it, for it pains me after such kind words, to foster any unfounded feeling against you." She rose hastily. "It disturbs my peace of mind to feel that I dwell in a house which the feet of other women avoid."

The Sovereign looked astonished at the woman who, with such firmness, controlled her inward excitement.

"The fortune-teller," he murmured.

"Your Highness knows well what fancy does," continued Ilse, sorrowfully. "It has tormented my soul, and made it difficult for me in this place to believe in the esteem of which your Highness assures me."

"What have they been telling you?" asked the Sovereign, in a sharp tone.

"What your Highness ought not to desire to hear from my lips," replied Ilse, proudly. "It is possible that the master of a Court considers such things with indifference. I say that to myself. But it is a misfortune to me to have been here: it is a stain on a spotless robe, and I fix my eyes wildly upon it; I wash it away with my hand, and yet it always lies before me, for it is a shadow that falls from without."

The Sovereign looked gloomily before him.

(To be continued.)

All things are connected with one another and the bond is holy. There is hardly anything foreign to any other thing. For things have been coördinated and they combine to form one and the same cosmos. For there is one cosmos made up of all things and one God who pervades all things and one substance, one law, one common reason in all intelligent animals, and one truth.—
MARCUS AURELIUS ANTONINUS.

BOOK REVIEWS.

In the *Art Amateur* for May, by far the most interesting article is one on Pen Drawing for Photo-Engraving. It is the third of the series, and is profusely illustrated with reproductions of pen and ink sketches. These are so carefully described and analyzed, as to direct the attention of the student to the most important points, and lead him to reflect on the principles illustrated in the work. Attention is also drawn to the roulette work, which is a quick method of producing strong effects, although the writer appears to think that equally good results, if not better, are produced by hand work alone. The article is by Ernest Knauff, who has the true German idea that long and careful study is necessary to produce good work.

"Architect's" paper on Home Decoration is illustrated by a very attractive looking, cozy corner with book shelves, and it contains some good hints to make home attractive.

A few words on lambrequins and corner cupboard will be very suggestive to housekeepers who like to contrive conveniences and decorations.

The number contains also the usual variety of designs, the gossip about picture sales, a paper on the influence of artificial light on color, some interesting statements regarding woods, and other instructive and agreeable reading. E. D. C.

In the latest number of *Mind* Dr. Maudsley discusses the Double Brain, which, he states, represents the halves of the body and the unity of the whole whereof itself is a part. The halves of the double brain, like the halves of the body, (one perhaps fuller than the other) have corresponding functions. Mr. Stephen presents the second paper "on some kinds of necessary truths." Mr. Stephen says that geometrical axioms are neither simple empirical truths, nor the result of a form arbitrarily imposed upon the sense-given symbols, but that they emerge under the necessity of correlating our various impressions by the help of certain assumptions (p. 214).

It is with pleasure that we learn of the proposed new edition (the eleventh) of Diesterweg's celebrated work, "Popular Astronomy and Mathematical Geography," (*Populäre Himmelskunde und Mathematische Geographic*.) The revision has been conducted by Dr. M. Wilhelm Meyer, whose name is well known to the readers of THE OPEN COURT, and Dr. B. Schwalbe, a distinguished teacher, of Berlin. The worth of the new edition needs no further warranty than the names of the editors afford. Complete in ten parts, 15 cents each. Emil Goldschmidt, Publisher, Berlin.

The publishing house of Wilhelm Engelmann, Leipsic announce the projected publication of a series of little works, entitled "The Classics of the Exact Sciences." The first will fitly be the famous monograph of Helmholtz on the "Conservation of Energy."

The *Revue de la Science Nouvelle* is a monthly magazine published by the Paris "Scientific Association for the Defense of Christianity." Its table of contents embraces a vast range of subjects of universal interest.

NOTES.

Prof. Edward S. Holden, the director of the Lick Observatory, contributes to *Himmel und Erde* for May, a paper upon the Lick Telescope and its achievements.

The *Revue Belgique* has been publishing, of late, a number of interesting papers upon instruction in Political Economy at the German and Austrian universities.

A series of articles, by prominent American scientists, upon the practical applications of electricity will begin in the June *Scribner*. The series will be a complete representation of the position of electricity in the industrial world.

Murray, of London, has issued a cheap edition of Darwin's "Naturalist's Voyage Round the World," which will ensure a wider reading for this masterpiece of narrative.

The new *Century Dictionary*, which has been in course of preparation during the past seven years, is about completed. We await its appearance with pleasure and expectant curiosity.

The researches in theoretical electricity conducted in recent years by Prof. Hertz, of Karlsruhe, have attracted widespread attention in the world of science. The results obtained point to the conclusion that electricity is an undulatory movement of the same medium which scientists have assumed to be the vehicle of light and heat. THE OPEN COURT will soon publish a paper descriptive and explanatory of Prof. Hertz's experiments.

The "Rise of the People of Israel," an historical sketch begun in this issue of THE OPEN COURT, is from the pen of Dr. Carl Heinrich Cornill, an eminent theologian of the University of Königsberg. An orthodox expounder of Christian doctrine, Prof. Cornill has nevertheless been actuated in his researches by the spirit of modern historical criticism. The essay originally appeared in the series "Sammlung gemeinverständlicher wissenschaftlicher Vorträge" (Rud. Virchow and Fr. v. Holtzendorff, Editors), from which the translation has been made.

The latest *Independent Pulpit* contains a controversy between Edgeworth and Pericles. Edgeworth (alias Dr. Lazarus) assails, in the name of anarchism, anything and everything that represents order or law. He fiercely attacks THE OPEN COURT in the name of agnosticism and materialism for "its representation of monism" which "is but a metaphysical fantasy" and its shadowy "order of atomic shapes," as if THE OPEN COURT had propounded some new atomic theory. He ridicules "the elegant troll of its wheelbarrow" because it "vilifies" (sic!) "mutual banking, the only possible mode by which labor can exchange with labor in avoiding a ruinous tribute to money monopoly." Edgeworth believes in polarity. Polarity is one of those words, alluded to by Mephistopheles in Goethe's Faust :

"Shun too over sharp a tension,
For just where falls the comprehension
A word steps promptly in as deputy.
With words 'tis excellent disputing,
Systems to words 'tis easy suiting;
On words 'tis excellent believing,
No word can ever lose a jot by thieving."

We recommend Edgeworth to read what Professor Huxley has to say on polarity. He says in his article on agnosticism in the *Nineteenth Century* of February, 1889 :

"Polarity is a word about which I heard a good deal in my youth when "Natur-Philosophie" was in fashion, and greatly did I suffer from it. For many years past, whenever I have met with 'polarity' anywhere but in a discussion of a purely physical topic, such as magnetism, I have shut the book."

Pericles encounters the gallant knight of anarchism who wants "liberty in love and love in liberty" with great ability and good humor. He says :

"One cannot help remembering the advice given Paddy at the Donnybrook Fair : 'Wherever you see a head, hit it ;' and as the legend tells us, Paddy did so without much caring whether it was the pate of friend or foe."

Pericles, it appears in the discussion, is a Frenchman whose lay sermons in the *Independent Pulpit* and other papers are efforts to introduce the Athenian spirit into our nation. "The first thing to be done," he says, "is by an artistic education to raise the minds of the people to a higher and nobler standard, that they be, as said Gambetta, 'un peuple artiste.' Meliorism and Art are twin brothers. It is this conviction that has led me to take, as *nom de plume* the name of Pericles."

THE TEACHER'S OUTLOOK.

Published by The Teacher's Publishing Company, Des Moines, Iowa. A monthly magazine devoted to the interests of teachers and advanced pupils and intended to supplement the good work done by other school journals rather than to occupy the same field. Instead of filling its columns with school methods, school aids, and the details of school work, it will aim to interest the teachers in matters outside of the atmosphere of the school room, and its columns will furnish an OUTLOOK upon affairs of life, facts in science and nature which illustrate and test the theories of the schools. In this work it will hope to furnish the teacher with a natural source of inspiration and mental energy, quicken thought and make the school room a place joyous with buoyant spirits that offer a responsive greeting to the inquiring minds of youth rather than heavy with that gloom and dullness which often surrounds the daily toil.

A leading feature of the magazine will be a monthly review of current events, civil and industrial problems, scientific inventions, discoveries, etc.

Another feature will be a very complete Review of current Literature, especially of all books and magazines coming within the sphere of its labor. We have entered into arrangements with all the leading publishers to be kept informed of all their new and prospective publications, and the Reviews will be made by competent critics.

Still another feature, and a very important one as giving a practical value to the OUTLOOK offered, will be the formation of a circle of writers out of its subscribers, from which it hopes to draw its corps of contributors. This plan is original as applied to a magazine, and is based on the idea of co-operation, or mutual helpfulness. If met with that appreciation necessary to its full execution it will be the means of introducing many new writers to the public, and of aiding many who now lack the training in the expression of thought necessary to a kindly reception in the field of literature into which their tastes would lead them. For further particulars send four cents for Prospectus, or fifty cents for magazine eight months. 112

Original, Simple, Natural, Suggestive, Comprehensive, Educational, and helpful entirely apart from the memory phase of the subject.

PUBLICATIONS OF "THE OPEN COURT."

The Idea of God.

By Dr. PAUL CARUS.

PRICE 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing.

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Entheism, the Monistic Conception of God.

Three Introductory Lectures

The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

Neatly Bound in Cloth. Price, 75 Cts.

NEW PUBLICATION.

THE

Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY
By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects

1. The Psychology of the Cell.—Introductory.
2. The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.
3. The Psychology of Nutrition: Holoblastic, Sarcohytic, and Animal Nutrition; Predatory Habits of Certain Animalcules.
4. Colonies of Unicellular Organisms.
5. Recrudescence of Proto-Organisms.
6. Recrudescence of Higher Animals and Plants.
7. The Physiological Function of the Nucleus.
8. Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Hereby it is distinguished apart from the author's original investigations, the researches of Balbiani, Claparde and Lachmann, Maujas, Ribot, Tschudi, Engelmann, Ekin, Fouchet, Heber, Pfeffer, Kent, Djardain, Gruber, Nussbaum, Bütschli, Lieberkühn.

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Dr. C. Z. Romanes, that the first appearance of the various psychical and intellectual faculties is assignable to different stages in the scale of zoological development.

16 mo, 135 pages. Cloth, 75 Cts, Paper, 50 Cts.

OPEN COURT PUBLISHING COMPANY,
P. O. Drawer F., Chicago, Illinois.

TO ADVERTISERS!

For a check for \$20 we will print ten-line advertisement in Our Illinois issues of leading American Newspapers and complete the work within ten days. This is at the rate of only one cent a line from the author's original investigations, the researches of Balbiani, Claparde and Lachmann, Maujas, Ribot, Tschudi, Engelmann, Ekin, Fouchet, Heber, Pfeffer, Kent, Djardain, Gruber, Nussbaum, Bütschli, Lieberkühn.

We have just issued a new edition of our Book called "Newspaper Advertising." It has 256 pages, and among its contents may be named the following Lists and Catalogues of Newspapers:—

DAILY NEWSPAPERS IN NEW YORK CITY, with their Advertising Rates.
DAILY NEWSPAPERS IN CITIES HAVING more than 100,000 population, omitting all but the best.
DAILY NEWSPAPERS IN CITIES HAVING more than 50,000 population, omitting all but the best.
A SMALL LIST OF NEWSPAPERS in which to advertise every section of the country; being a choice selection made up with great care, guided by long experience.

ONE NEWSPAPER IN A STATE. The best one for an advertiser to use if he will use but one.

GAINS IN ADVERTISING IN DAILY Newspapers in many principal cities and towns, a list which offers peculiar inducements to some advertisers.

LARGEST CIRCULATIONS. A complete list of all American papers issuing regularly more than 25,000 copies.

THE BEST LIST OF LOCAL NEWSPAPERS, covering every town of over 5,000 population and every important country seat.

SELECTED LOCAL NEWSPAPERS, in which advertisements are inserted at half price.

5472 VILLAGE NEWS PAPERS, in which advertisements are inserted for \$2.15 a line and appear in the whole lot—one half of all the American Weeklies Book sent to any address for THIRTY CENTS.

JUST PUBLISHED! Fundamental Problems.

The Method of Philosophy as a Systematic Arrangement of Knowledge.

By Dr. PAUL CARUS.

PRICE ONE DOLLAR.

*No Agnosticism but Positive Science,
No Mysticism but Clear Thought,
Neither Supernaturalism nor Materialism,
But a Unitary Conception of the World.
No Dogma but Religion,
No Creed but Faith.*

From the principle of positive philosophy indicated in the title, the author objects to Supernaturalism as well as Agnosticism. He proposes a unitary conception of the world on the basis of facts and discusses the most vital questions of philosophy and ethics; among them the problems of—*Formal Thought (Kant's A Priori)—Causality—The Origin of Life—Absolute Existence—Space and Time—Infinity and Eternity—Free Will—Ethics and Natural Science—The Importance of Art.*

Review of Recent Work of THE OPEN COURT.
PHILOSOPHY.

HEDONISM AND ASCETICISM. EDITOR.....No. 81

Philosophy has two aspects. Of these, ethics forms the practical aspect, and, a systematic conception of the universe, the theoretical. Philosophy and ethics go together; fallacy in the one leads to corruption in the other. Materialism will logically end in hedonism or utilitarianism, for it places the object of life in material well-being, in happiness; Spiritualism will lead to asceticism, a renunciation of the pleasures of the world. Monism rejects both views; it sees the purpose of existence in progress, in the constant aspiration after something higher and nobler.

HISTORICAL AND CRITICAL.

THE DISCOVERY OF THE VEDA.—THE INTERPRETATION
OF THE HINDU EPIC. H. OLDENBERG. Nos. 84 and 85

Prof. Oldenberg is one of the most eminent Sanskrit scholars of the present day. He tells us in popular language the story of the origin, growth, and present state of Sanskrit research. The discovery of the Veda, which forms the subject of the paper published in No. 84, must be accounted the most important acquisition to science ever made through any one branch of oriental enquiry. The results of investigation in this department have reconstructed the foundations of comparative history, philology, philosophy, and religion. Through the untiring efforts of great scholars, a new world, a new literature, a new and strange people have been revealed to us.

DEFINITIONS EXPLANATORY OF THE POSITION OF
"THE OPEN COURT."

THE DATA of experience are perceptions.

REALITY is the sum total of all that is.

TRUTH is the conformity of cognition to reality.

[Truth being a relation between subject and object appears to be relative in its nature. Absolute truth is a self-contradiction; it would imply cognition without a cognizing subject.

At the same time it is obvious that absolute existence (in fact everything absolute) is impossible. Reality is properly called *Wirklichkeit* in German, derived from *wirken*, to take effect. Reality is not immovable and unchangeable absoluteness, but the effectiveness of things in their relations. Reality therefore implies not only existence, but the manifestation of existence also. Existence and its manifestation are not two different things; both are one.

The idea of something absolutely Unknowable is therefore untenable; it would imply the existence of an object whose existence is not manifested *i. e.*, existence without reality; *Sein ohne Wirklichkeit*—which is a contradiction, an impossibility.]

SCIENCE is the search for truth.

The nature of science is the economy of thought. (*Mach*.)

Economy of thought is possible through application of the laws of form to thought.

KNOWLEDGE is the possession of certain truths

[Knowledge is, so to say, the present stock or capital with which Science works. Science cannot exist without knowledge. The object of Science is not only to increase and enlarge knowledge but also to purify the present stock of knowledge from vagueness, errors, and misconceptions.

The purpose of knowledge is that of increasing our power over nature.]

MONISM is that philosophy which recognizes the oneness of All-existence, and the Religion of Monism teaches that the individual, as a part of the whole, has to conform to the cosmical laws of the All.

RELIGION is man's aspiration to be in harmony with the All.

[Religion has been defined differently in the columns of THE OPEN COURT, but all definitions that have been presented are in strict agreement. Mr. Hegeler in No. 25, defines Religion as "man's union with the All" (taking the definition from the Lutheran Catechism "Religion ist der Bund des Menschen mit Gott durch Gott," and replacing the Word God by the more comprehensive word THE ALL). The editor has defined Religion as "man's consciousness of his relation to the All" (No. 24); as "Das Allgefühl im Einzelnen," the All-feeling in the individual (see foot-note page 965); as "man's conception of the world that serves him as a guiding-star through life" (page 1180).]

MORALS are man's conduct in so far as it is in unison with the All.

[The basis of morality is religion. A moral educator or preacher may justly be asked, "On what authority dost thou justify thy precepts?" And he will tell us that his authority is not personal; he speaks in the name of universal order. Accordingly his authority is that of religion. If it were not so, all his good precepts would have no foundation; they would hover in the air like beautiful dreams that have no reality.]

ETHICS is the Science of Morals; it teaches man why he must, and how he can, regulate his conduct so as to be in unison with the All.

Natural history and the history of mankind prove that here on earth a constant progress takes place developing ever higher forms of existence.

Morally good are those acts which are in harmony with the All, *i. e.*, those which enhance progress, and *morally bad* are those which are not in harmony with the All, *i. e.*, those which retard or prevent progress.

[Religion (man's aspiration to be in unison with the All) has naturally produced many superstitious notions in the world, of its origin, and of its purpose. Similarly, science (man's search for truth) has produced many errors or false notions of reality. But all the superstitions of religion do not prove that religion as such is an illusion, and all the errors of science are no evidence that science as such is a sham.

It is obvious that religion and science, as here defined, are not contradictory to, but complementary of, each other. If religion and science do not agree, it is a certain sign that our conception of either the one or the other is wrong. The history of the human mind has been one of constant conflict and reconciliation between religion and science. Their relation has repeatedly been disturbed and re-adjusted.

The unitary conception of the world affords the only basis for the union of Religion and Science, and opens a new vista of progress for both.]

THE TRANSIENT AND THE PERMANENT IN THEODORE PARKER.

A DISCOURSE AT THE DISSOLUTION OF HIS SOCIETY, FEB 3, 1889.

BY MONCURE D. CONWAY.

NEARLY forty-eight years have passed since Theodore Parker gave his sermon, now historic, on "The Transient and the Permanent in Christianity." An occasion has now arrived which renders it fitting and reverent to estimate the transient and the permanent in his own teaching. For the honored Twenty-eighth Congregational Society now rests from its isolated labors, twenty-nine years after its founder rested from his.

The Society, sometimes known as the Fraternity, makes over this Memorial of its founder to another fraternity,—the Benevolent Fraternity of Churches. The two fraternities were born of the same spiritual mother, though they have been late in discovering the fact. In 1838, Emerson gave his great address before the graduates of Divinity College, Cambridge. Theodore Parker, then twenty-eight, wrote in his journal:

"Sunday, July 15, 1838. Proceeded to Cambridge to hear the valedictory sermon by Mr. Emerson. * * * So beautiful, so just, so true, and terribly sublime was his picture of the faults of the church in its present position. My soul is roused, and this week I shall write the long-meditated sermon on the state of the church and the duties of these times."

That was the inception of what was presently called "Parkerism." But about the same time another soul was roused,—that of Channing. The Unitarian apostle wrote: "I would that I could look to Unitarianism with more hope." He complained of a want of vitality and force which gave but little hope of its accomplishing much under its existing auspices and form.

Channing's eloquent emphasis on the moral and humanitarian side of Unitarianism alarmed theologians, but it impressed the congregations. An association of individuals was formed; it coöperated with the ministries-at large of various churches; and all these were incorporated, just fifty years ago, as the Benevolent Fraternity of Churches. Its object, as stated in the Act (Feb. 16, 1839), was "the moral and religious instruction of the poor in the City of Boston."

The religion which had been rationalized for scholars was now to be humanized for the poor. Soon after the voice of Theodore Parker was heard in the land.

It was not yet especially humanitarian; it was theological.

Rumors sped abroad of a wolf in sheep's clothing prowling after sheep; and one of the early acts of the Fraternity was to request its ministers not to exchange pulpits with Parker,—a request disregarded by John Sargent and James Freeman Clarke, in the interest of intellectual liberty.

The fears of the Benevolent Fraternity were transient; their moral earnestness was permanent. Regarded only as a gesture, the Benevolent Fraternity was prophetic of a movement now general; and one of its prophets, however unrecognized, was Theodore Parker. In an early sermon he said:

"Jesus goes out to that despised class of men, and says, He came to seek and save them. Was that a small thing? Even to-day, in democratic Boston, to be a minister to the poor is a reproach. He is esteemed the most fortunate minister who is ministered unto, and not who ministers.

"The man who in Boston gathers crowds of men from the common walks of life—what is he called? 'A preacher to the rabble,'—that is the ecclesiastical title."

The instruction of the incorporated Fraternity was not to be ecclesiastical or doctrinal; but simply "moral and religious." The Act reads as if Parker had written it.

I have heard that two members of a German peasant family, named Klein, emigrated at different times to this country, where they could not find each other. One translated his name, Klein, *Small*; the other translated his Klein, *Little*. Small and Little lived in the same street for fifty years, and only discovered that they were brothers when their old mother in Germany left a little money to be divided between them if they could be found. I shall leave you to apply the story to the two Boston Fraternities now amicably adjusting possessions bequeathed by that maternal liberalism of which they were offspring.

I do not propose to dwell on the history, so familiar, or accessible, of Parker's thorny pilgrimage to the painful prominence he reached as the heretic of heretics.

Unitarianism began as a textual protest. It had discovered that a Trinity was not taught in the Bible. But in the course of a long controversy, and by the larger culture it promoted, Unitarianism hatched a brood which needed a new element.

The orthodox pointed to the heretical tendencies as the fulfilment of their warnings. "We told you so!" When Francis Newman was a young clergyman, and first questioned an article, his brother, now Cardinal Newman, said, "Take care! if you go so far you will go farther." Francis answered, "When I see farther I will go farther." But that kind of courage cannot be expected of a whole church, which must carry along the slow with the swift.

The Unitarians denied with indignation that their new doctrines tended to general rationalism; and when their Divinity School began to send forth restless adventurers into seas guarded by Calvinistic chimæras, such were repudiated.

There was a sort of panic, in which some Unitarians for a time reversed the principles of toleration they had pleaded in the days of their own persecution. It was partly due to the outbreak of so-called atheism.

In 1834, Abner Kneeland wrote: "Universalists believe in a God, which I do not, but believe that their God with all his moral attributes (aside from nature itself) is nothing more than a chimæra of their own imagination."

After four years he was sentenced to two months imprisonment, and served out that last penalty of moribund bigotry, despite the protest of Channing. By his disregarded petition to the Governor for Kneeland's release Channing and his friends had suffered. They had made Kneeland himself the chimæra dire of Unitarianism.

Even Parker was not without his chimæra; and he declined to attend a Thomas Paine banquet, though Paine was only a premature Parkerite,—like himself an earnest believer in God and immortality. In short, as Paine said in the struggle for our national independence, so now, in the struggle for spiritual liberty, these were the times that tried men's souls. The wonder is not that so many were found wanting but that so many proved equal to the occasion.

It was in the thick of this revolution that Parker delivered his discourse on "The Transient and the Permanent in Christianity." The theme of it was that the spirit of truth and righteousness, which Christianity represented, naturally took its garb from the age in which it was born, or the ages through which it passed; that it was invested with the legends, rites, and speculations rife among those who successively had charge of it; that these investitures of it must necessarily be as transient as other speculations of the uncritical times in which they were woven. New sciences, races, aims, must weave new raiment for it. But through all changes, Christianity, summing up as it did the religion of love to God and man, belief in the All-perfect and immortality, would prove the absolute religion which would never pass away.

The power and poetic beauty of the discourse were never surpassed by Parker. But one wonders at the reign of terror. It is all so simple. The new Jerusalem still rests on transparent glass.

Channing was troubled not to find belief in miracles expressed in it, but he wrote:

"Let the full heart pour itself forth! Give my love to Mr. Parker."

The more logical brain of Gannett saw the inevitable next step before Parker himself saw it; and when the new thinker had presently rejected the miracles also he was ably answered.

Dr. Gannett did not lose his head; it was due to his inflexible justice that Parker was not excommunicated. He declared that Parker was a believer and preacher of Christian truths, but was destroying the historical evidence, the only evidence of those truths. They survived in him from the evidence he once believed, but those who followed him, being without the evidence, would not believe the truths.

This position was not met by the transcendental appeals to an inner oracle. Parker said the truth of the message does not depend on the authority of the messenger; the truth of geometry does not depend on the authority of Euclid. Geometry, however, was a thing that all might verify; divine fatherhood, life after death could not be verified unless by some historical evidence, except for those whose inner oracle responded. They were discredited by Abner Kneeland, for instance, who had been an orthodox, then a universalist preacher, had travelled somewhat the same road as Parker, and seemed to be an "awful example" of the landing-place to which the new views tended.

Of all this Parker was unconscious. He wept over the criticisms, but never admitted their force. This phenomenal fact is explicable only by another which his opponents did not appreciate; namely, that his mind was not skeptical, not negative, but essentially constructive. Only after he was dead, and his biography by John Weiss had appeared, was this realized. Then it was that his great, but always fair, antagonist, Dr. Gannett, wrote on Theodore Parker the true verdict:

"He was a very learned man, and a tender, true-hearted man, honest and thorough."

The whole source of Parker's heresies is in that sentence. Because Parker was a very learned man, he could not accept statements which criticism and scholarship had to him proved erroneous; because he was tender and true-hearted, he rejected traditional conceptions which to him showed God heartless; because he was honest, he spoke out what he believed.

Beyond his heart-heresy, and his veracity in abandoning proven errors, Parker was a great believer. There is sufficient reason for the favor now shown for

his writings by those who once resisted him. He was building the fortresses of their future. Their old misunderstanding need not be wondered at. Nay, it was not without its honorable side. It is an old story of shepherds watching by night that when the glory of the Lord shone round about them they were 'sore afraid.' No doubt they had their flocks at heart; and no man can now doubt that the watching shepherds of the last generation dreaded some omen in the new star, now welcomed by their successors.

And something analogous may be said of Parker's political radicalism. While Boston "society" disowned him he was yet of all men the most Bostonian. All the history that led to Boston, and built Boston, and made this old city a Sinai whose smoke and flame republished for this land the laws of liberty, were incarnate in Theodore Parker.

When Thackeray came to Boston he went first of all to the Music Hall, to hear Parker, and then to the preacher's library. Towards the close of his visit, being with George Ticknor, Thackeray said: "Ticknor, I have not got into the best Boston circle after all." Ticknor assured him that he had, and counted up the grand people he had met. But Thackeray replied: "Still, I can't have seen the best. No, no! Why, Prescott tells me he does not visit Parker."

If Boston did not love Parker, Parker loved Boston. I remember we had a little fable at the Divinity School that a Millerite met Emerson and cried, "The end of the world is at hand." "All the better," said Emerson, "Man can do well without it." The same fanatic presently meeting Parker announced the end of the world. "My good man," said Parker, "that does not concern me; I live in Boston." The story tells true. Boston is still learning in his library. In those bequeathed books is the life-blood of great men by whom he was fed; but of none nobler than he who so long gave this people to eat of his own broken body, and his blood daily shed for them.

Had Theodore Parker been adapted to our time, he could not have been so adequate to his own.

Near Plymouth, England, I remarked a memorial to an ancient worthy who built a market-house; beneath it was another memorial, to a later worthy, who cleared the market-house away and made a highway for the people. At Plymouth, Massachusetts, we may find a memorial of worthies who built a creed stonier than its famous rock, yet did some service in its time; and beside their names might be written, with equal honor, those of the men who pulverized the dogmas to pave the highroad of progress. High among these would be the name of Theodore Parker; yet none who know his spirit can doubt that could that faithful man reappear, and find that his pavement was worn out,

broken, or unequal to new needs, he would lead in the work of its replacement by a better.

The great teachers, including even Parker himself, are yet but heralds of the voice which shall announce the New World religion. It were faithless to their spirit to be satisfied with its perishable embodiment.

THE MIGRATIONS OF THE TRIBES OF ISRAEL.*

AN HISTORICAL SKETCH.

BY PROFESSOR CARL HEINRICH CORNILL.

Translated from the German by γυνή.

ACCORDING to established tradition the people of Israel were not native in the land that afterwards became their home, but had immigrated from the north-east of Mesopotamia; a tradition which is all the more striking in view of the fact that the language spoken by the people of Israel could only have originated in Canaan itself. This linguistic difficulty was felt even in Biblical times, as the remarkable forty-seventh verse in the thirty-first chapter of the first Book of Moses testifies: in this verse, which is plainly the product of a later learned interpretation, "Laban the Aramæan" calls the stone-wall which Jacob in the Hebrew language had called Galeed, "Jegar-Sahadutha," a correct Aramæan expression.†

According to the familiar tradition of the Hebrew people itself, its primitive home was in the mountainous tract extending between the left bank of the Tigris and Lake Van, which separates Mesopotamia from Armenia and by the Greek geographers is called Arrhaphachitis. (Arphaxad, son of Sem, is the ancestor of the Hebrew people—1 Moses x. 22-25; xi. 10). From the above-mentioned highlands there descended an emigration of tribes into the fertile plain of Mesopotamia. (Salah, Arphaxad's son, 1 Moses x. 24; xi. 12, denotes "emigration," "emission.") They crossed (Eber, Salah's son, 1 Moses x. 24; xi. 14, is "crossing," "passage") the Tigris, and then they separated, (Peleg, Eber's son, 1 Moses x. 25; xi. 16, is "separation," "division"); the main body advanced through the heart of the region and finally settled in and around the Haran, the Karrhae of the ancients, in the north-western part of Mesopotamia; a smaller band, including the ancestors of Israel, struck out in the opposite direction toward the extreme southeast and at Ur, in Southern Babylonia (1 Moses xi. 28, 31), endeavored to obtain possession of permanent settlements; still in the end they preferred to follow the main body of their kinsmen to Haran (1 Moses xi. 31). Here their migratory instincts awoke once more. Following the direction of the common high-road of the ancient world

* The value and interest of Prof. Cornill's articles will be greatly increased if read with Bible in hand.—Ed.

† All Hebrew words and names are given according to the spelling of the King James Bible.

between Egypt and Babylonia they journeyed still further toward the southwest (1 Moses xii. 4, 5). The great leader of this tribal migration was Abraham.

The most careful and impartial weighing of all adverse arguments and difficulties has not as yet been able to shake my faith in the genuine historical authenticity of Abraham; I regard Abraham as an historical personality in the strictest sense of the word, as really so as Alaric, the king of the Visigoths, or Rurik, the prince of the Varangians.

Egypt, perhaps, was the original ultimate goal of this Abrahamic migration, that same Egypt which time out of mind had exerted a kind of magic attraction upon all Semitic tribes, and which probably even during the very centuries of the Abrahamic emigration, on repeated occasions, had received, and (not always willingly) harbored Semitic guests on its fruitful soil. Still, the story purporting to be an account of Abraham's expedition into Egypt (1 Moses xii. 10-20), is altogether a recent one and purely a luxuriant outgrowth from the stem of the original tradition. As a matter of fact the Abrahamic migration remained in Canaan. One division of this migration, the one personified in Lot, moved toward the eastern bank of the Jordan (1 Moses xiii. 7-12), where comparatively early both nationally and politically it became consolidated as Moab and Ammon (1 Moses xix. 37-38). Abraham himself settled in the west Jordan region, the Canaan proper (1 Moses xiii. 12).

Abraham and his tribal kinsmen were nomads, wandering shepherds, roaming peacefully about the country; while the aboriginal inhabitants of the land had long before attained the higher culture of city life. The immigrants borrowed their language from the latter, but at the same time guarded as before the primitive purity of their pastoral life, and their healthy, naïve natural sense revolted above all against the religion of the Canaanites.

The religious character of the Canaanites particularly displayed two characteristic manifestations: *viz.*, religious obscenity, and infant sacrifice; Abraham held aloof from both. In the touching and deeply poetical story of the intended sacrifice of Isaac, for whom ultimately a ram was substituted, tradition (1 Moses xxii.) has recorded Abraham's positive rejection of infant sacrifice.

In describing this predominant feature, and in characterizing Abraham as a religious hero, tradition has, further, correctly interpreted the true state of things. The work of Moses was not an absolutely new one; it is linked to a popular initiative of the past, and there is no reason for entertaining a doubt, when tradition even in this most specific manifestation of the Israelitic popular spirit makes Abraham the patriarch of his race; although very naturally we now are unable to

prove and correctly expound in all its details this "faith of Abraham."

The descendants of Abraham in the West Jordan region, true to the usage and customs of their fathers, continued wandering nomads. Being unable to wrest lands from the superior power of the Canaanites, they turned their eyes southward to the highland about Mount Seir, where the primitive tribes of the Horites both in power and culture stood far below the Canaanites. The main body of the descendants of Abraham, accordingly, pushed forward toward the south, conquered the Horites, and settled down permanently on Mount Seir as Edom (1 Moses xxxvi. 1; 5 Moses ii. 12-22), and soon effected their national and political consolidation. Edom thereupon remained in undisputed possession of the aforesaid territory.

The remnants of the descendants of Abraham, who had remained behind in the West Jordan region, would perhaps have been absorbed by the Canaanites, or would have been compelled to seek connection with one of the kindred tribes, if a new and considerable immigration from the common ancestral home of Haran had not brought them aid and reinforcements. This was the Jacobite migration, represented in the person of Jacob.

It is the merit of Ewald with subtle insight to have detected in Jacob the "after-comer," the "loiterer."

Jacob appears as the father of twelve sons; these are the twelve tribes into which in historical times the people of Israel were divided. The twelve tribes again became subdivided into four groups, by legend personified in four mothers, two legitimate wives and two concubines of the patriarch, *viz.*: a Lea-group, a Rachel-group, a Bilha-group, and a Zilpa-group; Lea and Rachel were the more considerable, Bilha and Zilpa the inferior groups. The Lea-group surpassed all the others in number and importance, and the Zilpa division was connected with it; yet the Rachel-group was hardly inferior in power and nobility, and the Bilha-group closely adhered to the latter.

The legend states that Jacob brought along with him his eleven sons out of Haran; only the youngest, Benjamin, was born in Canaan. Might we also from this draw certain historical conclusions? As regards the rise and growth of the tribes, we are confronted with the most obscure problems of the prehistoric period of the people of Israel, which perhaps never will be perfectly cleared up. Tradition is only in so far incontrovertibly right as it relegates the beginnings of tribal growth to pre-Egyptian times, while weighty reasons corroborate the truth of this fact; and we have likewise to regard as correct, that the tribe of Benjamin comparatively rather late branched off from that of Joseph. But nothing more definite than this can be asserted.

Ewald has given expression to a clear hypothesis, which, in fact, possesses a high degree of probability. He believes that in the Lea-group he can discern the remnants of the Abrahamic group that remained in Canaan; in the Rachel-group the auxiliary reinforcement from Haran, that is, the Jacobite migration:—a statement, that asserts much. At all events, the Jacobite migration certainly did join the remnants of the Abrahamic migration that had remained in Canaan, and henceforth becomes the representative of the entire national and historical development. The Jacobite migration, however, entered not only externally but also spiritually upon the inheritance of Abraham; the faith of Abraham passed to Jacob and was perpetuated in him as the father's noblest legacy.

Yet at an early time there must have arisen contentions among the kindred tribes. Joseph, from whom Benjamin perhaps had not as yet branched off, boasting his power and noble pedigree, claimed the supreme hegemony, but was forced to yield to a coalition of the other tribes, and went into Egypt where the rich pasturages of the Asiatic border-land, since remote antiquity had been the playground of Semitic nomads. The Lea-tribes at this conjuncture seem to have attempted to draw the Bilha-tribes, Dan and Naphtali, into the spheres of their power, the latter sub-tribes having been deprived of their old support; and Reuben, particularly, seems to have intended to do them violence, (1 Moses xxxv. 22); but both those vigorous and valiant tribes were able to maintain their independence, and Reuben himself came out of this contention so severely damaged that henceforth and for all time to come he lost his "primogeniture," his old power and tribal prestige (1 Moses xlix. 4).

Later there occurred events that forced them all to emigrate; but we are, of course, utterly unable to give a precise account of these events. On this occasion Joseph wreaked a noble vengeance, hospitably receiving his brothers in the district in which he had settled, oblivious of the old injury and only mindful of the old relationship. And in this manner the sons of Jacob became inhabitants of the land of Egypt.

At first the Egyptian government seems to have assumed a well-meaning attitude of neutrality toward the strangers; but soon the situation became completely altered. The Pharaoh Ramses II happened, at the time, to be involved in a severe conflict with the populations and kingdoms of western Asia; Palestine, partly at least, being the theatre of the struggle. The contest, as regards Egypt, ended, indeed, not in open defeat nor yet in victory; the ultimate result being a peace which nevertheless failed to warrant complete security to either side. The consequence was that henceforward Ramses naturally began to look with mistrust upon the foreign population of alien blood

that had settled on the Asiatic border, while at the same time he happened to be in need of laborers for his numerous public works. He, accordingly, resorted to the expedient of pressing into the service of the State all the Semites who were settled on the eastern border of Egypt on the isthmus of Suez, and under strict military supervision compelled them to perform toilsome villain-service.

Incidentally I may observe, that I am fully aware of the arguments which have recently been advanced against the hypothesis that Ramses II, the Sesostris of the Hellenes, in reality was the Pharaoh of the oppression, and his son Merenpta the Pharaoh of the Exodus. These arguments are well worthy of a most earnest consideration, but the accepted identification of both Pharaohs still appears to me as the most satisfactory.

In this manner, Israel, from free nomads, had been turned into Egyptian socage-serfs. So long as Ramses, one of the most warlike of the Pharaohs, wielded with a strong hand his iron sceptre in Egypt, the oppressed Israelites seem reluctantly to have borne up with their hard fate. But even chains of servitude availed not to break the stubborn, independent heart of those proud Bedouins. When the turbulent Ramses was succeeded by a son very unlike his father, the people of Israel again took heart. There only lacked a resolute leader who should guide the latent ferment to a definite goal; this leader was soon found.

Moses, a Hebrew of the tribe of Levi, had through a fortunate chance been received into the ruling caste of Egypt and thus found an opportunity thoroughly to acquire Egyptian training and culture. But the natural impulse of his heart drew him toward his own people; he preferred to be the brother of these despised serfs rather than live in the enjoyment of Egyptian splendor and magnificence. His keen insight soon discerned that the only way to free his people from the iron encompassment of Egyptian fortresses and military garrisons lay across the sea into the heart of the desert. It was a desperate undertaking. He obtained precise information concerning the topography and the political situation of the neighboring country, allied himself with kindred Bedouin tribes of the Arabian desert, and when dreadful scourges and visitations were terrifying the Egyptians, and had paralyzed their efforts, Moses thought the right moment was at last arrived: his fellow-countrymen with many other kindred national elements in their train (2 Moses xii. 38; 4 Moses xi. 4) assembled, and forthwith marched forth from the land of bondage.

By well-devised marches and maneuvers they were able to deceive the Egyptian guards on the frontier; they soon reached the Isthmus of Suez, but there they were overtaken by a flying corps of Egyptian cavalry.

Before them the raging sea, behind them their pursuers, panting for revenge. It was a moment of supreme anxiety! A violent northeast wind drove the shallow waters from the channel, and they marched through on the dry bottom of the sea into the desert, to freedom. The pursuing Egyptians were overwhelmed by the retreating flood; but Israel was safe.

The entire highway leading to Canaan being in undisputed possession of the Egyptians, and the latter by treaties with the neighboring kingdoms having stipulated the mutual extradition of all fugitives, Moses accordingly led his people into the narrow defiles of Mount Sinai, which were accessible indeed to a band of wandering nomads but could not be approached by a large army. Israel tarried for a long time in the region of Mount Sinai, and in this grandly impressive mountainous scenery tradition has located the scene of Moses's greatest work, his religious reorganization of the people. The entire tradition is agreed to the effect that Moses was the initiator, pioneer, and creator of that unique spirit which belonged peculiarly to the people of Israel, and through which it most radically differed from other tribes related by speech and descent. There, upon Mount Sinai, Moses gave to Israel its national God Jahve* (this is the original and correct pronunciation, instead of Jehova), thereby making Israel a nation as the people of Jahve. The name of Jahve, in fact, cannot be explained from the Hebrew tongue, but seems to have been borrowed from Sinai; and, indeed, according to Israelitic tradition, Moses's adviser and assistant, his father-in-law Jethro, was a priest of Sinai (2 Moses xviii).

Still, it remains utterly impossible to state precisely and positively of what the work of Moses really consisted, since—however unwelcome the truth may be—not even the ten commandments can be regarded as having been actually formulated by Moses; we have here only an inverted conclusion from effect to cause. Israel is the only people known to us that never had a mythology; not even making the easy step, by way of complement, of associating a female divinity with the highest divine being. Jahve's unique nature must accordingly be a Mosaic idea. Jahve alone is the God of Israel and this Jahve is the origin and source of all divine and human law; this must be a thought peculiarly Mosaic. A lofty spiritualization of the divine idea and, as a direct result of this, a lofty spiritualization of the Ethos are to be regarded the prominent features of the Mosaic Jahve faith. We have, moreover, to at-

tribute to Moses the creation of, at least, a very simple worship; since a religion without worship would be, with primitive nations, inconceivable. The institution, also, of a priesthood as the only legitimate mediator between Jahve and Israel must be Mosaic; but the tradition that Moses entrusted his brother Aaron with this high office has not been found as yet among the oldest sources.

Sinai, however, was only a station and not the final goal of the migration. Soon after, the multitudes, strengthened by their rest, moved onward; this time to Kadesh-Barnea in the desert south of Canaan (4 Moses xiii. 27; xx. 1, 14; 5 Moses i. 19, 46; Judges xi. 16, 17). This locality, at least, seemed sufficiently adapted to receive the permanent colonization of frugal shepherds; it lay beyond the reach of the Egyptian arms, and yet on the very threshold of the coveted land itself. Here they might quietly await the development of things. According to all traces the sojourn in Kadesh must have been a rather long one. Moses probably died there. Tradition is constant in regard to the point that he never personally entered the land of promise; in fact, neither he nor any other of the emigrants that left Egypt. And this constant tradition is all the weightier if we recall to mind that here there is the question of a distance that under normal circumstances it would be easy to complete within a fortnight.

An external event finally brought Israel to the goal of its wishes. The Canaanites, here called Amorites, under a king called Sihon, made an advance upon the eastern bank of the Jordan, drove the Moabites and Ammonites out of the most fertile parts of their territory and founded a new Amorite kingdom with the capital of Hesbon (4 Moses xxi. 26). Then they remembered their kinsmen in the desert at Kadesh. Moab and Ammon themselves, perhaps, on this occasion invoked the aid of Israel; at all events they were welcome allies, and the youthful and well-husbanded natural strength of Israel was able to achieve the proposed task: they destroyed the kingdom of Sihon of Hesbon; and Israel remained settled in the fruitful region, and kept for itself the price of war and victory.

Yet soon the fertile valleys and meadows could not contain the ever-increasing number of men and flocks; they were urged restlessly to cross the Jordan. There seemed to exist every possibility of settling down across the river. According to all accounts the Canaanites were scattered in numerous small isolated territories without internal connections or mutual sympathy; moreover their energy had been relaxed by luxurious habits, and in valor they could not match the impetuous sons of the desert.

Judah was the first to advance (Judges i. 1-20; 1 Moses xxxviii. 1). He crossed the Jordan and turned toward the south where the mountain range that later

*The word *Jahve*, according to the traditional etymology, is derived from the verb *hajah*, "to live, to exist, to be," and signifies "the being, the living, the eternal one." So it is explained in "The Idea of God," page 7 and 8. Professor Cornill in a private letter to the editor of this journal, writes: "My reason for not considering Jahve an original Hebrew word, is founded upon the fact that *hajah*, in the sense of *to be*, is not Hebrew. In a word or originally Hebrew the change of *v* into *j* would be difficult to account for."—Eo

bore the name of Judah, with its fruitful slopes excited his covetousness. Judah doubtless succeeded in gaining a permanent foothold in this region, but only at the cost of severe losses which were made good by the amalgamation of Canaanite, Edomitic, and Arabic elements; but after a hard and long struggle "the interloper" (Pharez) became the master of "the first begotten" (Zarah) (1 Moses xxxviii. 27-30). In the time of David, when Judah stands in the broad day-light of history, the Israelitic part of the population is undisputed master of the country, and the latter throughout felt as Israelitic.

The tribes of Simeon and Levi made the second attempt, which turned out a complete failure. By means of treason they obtained possession of the Canaanite City of Schechem, commanding the Mountain of Ephraim; but Israel turned shuddering away from the nefarious deed, and Simeon and Levi were vanquished by the revenge of the Canaanites (1 Mos. xxxiv. 25-30; xlix. 5-7). Levi as tribe was entirely exterminated, yet later through a most remarkable metamorphosis awoke to a new life as a sacerdotal caste, and the remnants of Simeon hid with the kindred tribe of Judah (Judges i. 3) by which they were absorbed.

The house of Joseph undertook the third and most successful expedition. Only Reuben and Gad continued to dwell in the East-Jordan district; the other seven tribes under the leadership of the Ephraimite Josuah combined in a common campaign against Middle and Northern Palestine. They gained a firm foothold in Gilgal on the other side of the Jordan (Josh. iv. and v.) and from that position they were able to conquer Jericho (Josh. vi.), Ai (Josh. viii.), and Bethel (Judges i. 22-25). Then at last the Canaanites were aroused into a determined and general resistance, but at Gibeon they were an other time defeated by Josuah (Josh. x.) and thus Israel became the master of all Middle Palestine. In the north they were again confronted by a coalition of Canaanites under king Jabin of Hazor; but at Lake Merom it was likewise vanquished by Joshua.

The conquest of Palestine and the establishment of the Kingdom of Israel, will be related in a subsequent number.

OUR religion is geographical, belongs to our time and sphere; respects and mythologizes some one time, and place; and person, and people.—*Emerson*.

WISE on all other topics, men lose their head the moment they talk of religion. It is the sturdiest prejudice in the public mind that religion is something by itself; a department distinct from all other experiences, and to which the tests and judgments men are ready enough to show on other things, do not apply.

—*Emerson*.

THE SITAHARANAM; OR, THE RAPE OF SITA.

AN EPISODE FROM THE GREAT SANSKRIT EPIC "RAMAYANA."

TRANSLATED INTO ENGLISH BY PROF. ALBERT H. GUNLOGSEN.

II.

अथ सीताहरणम् (अर्षि रामायण
अरण्यककाण्डे अष्टचत्वारिंशत्या अष्टौ सर्गाः)

आत्मनो मरणं मत्वा संशयं परमं मतः ।

१ अकामो भयसंविग्रो निःश्वस्य बहुशस्तदा ॥

निश्चितं रावणं दृष्ट्वा मारीचो भयविकृतः ।

२ गच्छामीत्यब्रवीद्दीप्तो दीनो नक्तंचरेश्वरम् ॥

Now Maritcha* forecasting his own death grew perplexed at heart, unwilling and trembling with fear; but on seeing Ravana determined, he said at last, with many sighs: I shall go then!

Ravana, the lord of the nightly-roving Rakshas, grew overjoyed at this determination, and in a hearty way embracing him, he replied: This generous resolution is worthy of you, O hero, and now I behold Maritcha in his true character.

You must now mount with me my swift, easy chariot, all studded with precious stones and drawn by wild asses with Pisatcha-faces.† Then mounting they at once drove away from the neighborhood of that hermitage.‡ On the way they enjoyed the sight of pleasant towns and lotus-lakes, mountains, rivers, and various inhabited regions.

Having at last reached the forest of Dandaka they descried in the distance the hermitage of Rama. Then alighting from their swift, easy chariot, bright with many costly ornaments, Ravana seizing Maritcha by the hand spoke as follows:

"That yonder, looming up in the distance, is the hermitage of Rama, surrounded by plantain-trees. Let us now, O dear friend, set about the work which brought us hither."

At these words of Ravana Maritcha with great alacrity at once divested himself of his native form of Rakshas-fiend, and transformed himself into a golden stag.

In his disguise he looked the most charming of created beings, of a shimmering silver hue as if sprinkled with countless glittering drops, playing in the blended colors of lotus, crystal, and emerald, with four antlers that seemed of gold, set with precious stones.

*As told in the introduction, Maritcha is a so-called Raksha-fiend. By the blend Aryan tribes the aboriginal black tribes of India and the Dravidian populations of the Deccan in the South were identified with demons, monkeys, etc.

† The Pisatchas were a class of evil spirits.

‡ Namely, the locality in the forest where they happened to be at the time.

Having assumed this glorious stag-like form, he kept moving slowly in front of Rama's hermitage.

He now well felt that his own life-time was verging on its last hour. Whether right or wrong, he said unto himself, "the thing has certainly to be done, whether for my master's sole profit, or to earn a speedy heavenly reward. And when I recall to mind the indomitable valor of Rama and my own master's peremptory commands, it is only meet that I should prefer the latter to my own earthly existence." In this frame of mind and with the vision of his death before his eyes, Maritcha endeavored to catch at a high resolve, and lingering within the sight of Rama and Sita, he strove to attract their attention. In this manner Maritcha approached the formidable Prince Rama, a hero worthy of his ancestors; the royal hermit who had renounced all earthly pleasures, and true to his vow was treading the path of virtue.

Not far from him Maritcha, the son of Sunda, beheld the blameless Princess Sita, in her dazzling beauty like the purple effulgence of the setting sun.

Yet Sita had been the first to perceive him.

(To be continued.)

LOVE-LONGING.

(See D. G. ROSSETTI'S beautiful sonnet, "Love-Sweetness.")

BY LOUIS BELROSE, JR.

NOT that the fragrant shadow of her hair
Is on thy face, nor that her hands are wed
A tender lily wreath about thy head,
I'm envious; nor that her features wear

The love her soft remembering sighs declare:
Not that her bosom's white is turned to red
Beneath thy lips which on her own had fed;—
Not therefore; no, my lady too is fair.

But because thou hast known that sweeter thing
For want of which my soul finds nothing sweet—
A listener to the song that it would sing.

Because thy spirit, when its pinions beat
The lonesome air "in cloud-girt wayfaring,"
Feels "breath of kindred plumes against its feet."

1877.

GEMS FROM THE GERMAN.

TRANSLATED BY MARY MORGAN (GOWAN LEA).

I.

JOY AND PAIN.

Two chambers hath the heart:

Joy dwells in one;
Pain owns the other part.

Joy rules the present hour;
Pain is asleep,
Unconscious of her power.

Step lightly, Joy! Take care
To whisper low;

If Pain awake — — — beware!

—Herm. Neumann.

II.

BY THE SHORE.

WHAT write the waves upon the sand?
A sad complaint thereon they trace:—
We come, we go,—an endless race;
No rest for us upon the land!

I yearn to sail the shining sea;
My deepest joy and secret hope,
I wrote upon the sandy slope:
The waves have stolen it from me!

—Gottschalk.

III.

WHOSE LIFE IS SORROW.

WHOSE life is sorrow, and whose sorrow, life
(Perchance, what I experience, may guess);
Whose every aim at earthly happiness
Has to succumb before this mortal strife;

Whose footsteps sinuous labyrinths ensnare,
And when he would return, their portals hide;
Whom Cupid hath allured unto his side,
In order to provoke a grim despair;

Unto whom lightning's flash new fears disclose;
And, from whom, billows of the angry deep
Receding, wipe away all hope of weal;
Who envieth the dead their dreamless sleep;
Whom Love can no more mock, nor discompose;
He understands me,—he feels what I feel.

—Von Platen.*

CORRESPONDENCE.

WHEELBARROW'S ERROR.

To the Editor of THE OPEN COURT:—

WHEELBARROW is such a wriggler that it is rather hard to pin him down, but I think it can be done if THE OPEN COURT will keep its columns open for the single-tax discussion a little longer.

Whatever may be the effect of his adroit rhetorical sleight-of-hand performances upon many of your readers, everything he writes only serves to make it more apparent to every intelligent single-taxer that he does not understand the single-tax doctrine. He has a convenient number of friends whom he brings into the arena and makes perform illustrative tricks—Tom Clark and the fellow who threw his boot through the window, and the other fellow who stuck the pig—but they all serve to illustrate the one conspicuous fact aforesaid, that with all Wheelbarrow's cleverness he is not clever enough to understand a doctrine that is perfectly clear to many other persons not half as bright as he.

In his communication, of May 2, he becomes very jocose over my calling the single-tax ground-rent, and quotes the following passage from Mr. George to prove that it is something more than ground-rent:

"Now it is evident that, in order to take for the use of the community the whole income arising from land, just as effectually as it could be taken by formally appropriating and letting out the land, it is only necessary to abolish, one after another, all other taxes now levied, and to increase the tax on land-values till it reaches, as near as may be, the full annual value of the land."

I have left it just as he italicized it, and I ask any of your readers to read it again and decide whether it means anything but ground-rent. To take the full annual value of land is simply ground-rent, whether it is taken by an individual or the commu-

* Platen has been compared to a snow-covered volcano.—Tr.

nity. It is not to appropriate the *land* but it is to appropriate the *value* of the land "just as effectually as it could be taken by appropriating and *letting out* the land." It is ground-rent. And if, instead of ridiculing the idea, Wheelbarrow will but reflect upon it, he will save himself any further exposition of his lamentable ignorance upon the subject.

As for the practicability of doing the thing which Wheelbarrow scouts, I have only to say that it *is* done in your own Chicago in the case of some land right in the heart of your city, that upon which your greatest National Bank stands, I think, just as it is done in New York in the case of the city docks. There is no use to say a thing cannot be done when it *is* done.

Wheelbarrow says that under the George system Tom Clark would be taxed \$8 or \$10 on his farm. I think friend Tom would be glad if he only had to pay \$8 or \$10 a year in taxes. But on Wheelbarrow's own statement that Tom's farm was worth nothing above his improvements, I declare that under the George system he would pay no taxes of *any kind*. He says, that Tom would be "evicted" and lose his improvements if some one should over-bid him. I reply that the fear of eviction was not before the eyes of the men who built the massive buildings in Chicago upon the city ground-rent plan.

Wheelbarrow does not know what he is writing about. He does not understand the George system, and I think before he writes any more upon the subject, he should inform himself.

When he says that under the George system "the *land itself* and not the value of the land" would be sold by the sheriff to satisfy the claims of the tax-collector, he talks nonsense. *How can land which is taxed by the government up to its full rental value have any selling value?*

Wheelbarrow says:

"If Mr. George left the key to his problem in the hands of any man, he left it in the hands of Mr. Pentecost."

Your readers here have Wheelbarrow's word for it that if anyone knows what Georgeism is, I do. Very well. There can be no doubt then that I know what I am talking about upon this subject. I ought, therefore, to be a good judge of another's knowledge upon the same subject, and I say to the readers of THE OPEN COURT that Wheelbarrow's arguments concerning the single-tax should have no weight with them because he does not understand the subject.

Allow me to repeat that the single-tax means simply the payment of ground rent and *nothing else* into the public treasury. As to whether this would be a heavier burden to the farmer than he now bears, any farmer can decide for himself by calculating what his land is worth *without improvements*, estimating what a tax of four or five per cent. on that amount would be and comparing the sum with what he now pays in all other taxes, including internal revenues, tariffs, and the interest on the mortgage that is probably on his farm.

If Wheelbarrow were not so given to "high-jinks" in his writings upon this subject, if he were not so happy in the light and airy way in which he dances around it, if he were a dull man, it would not be necessary to "jump on" him. But for his own sake as well as for the sake of many of his readers there is nothing to be done but to advise him plainly to study the subject further before he attempts to instruct others upon it.

I might take up some other points in his paper, but what is the use? In the next article Wheelbarrow would simply prance into the ring and pull yards of pretty paper out of his mouth, followed by colored fire. But on the pretty paper nothing relevant would be written and from the fire would come no light upon the theme.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXV.—Continued.

The Sovereign looked gloomily before him.

"I shall not use the subterfuges that you put into the mouth of a master of a Court, for I feel at this moment, deeply and passionately like you, that an injury has been done your honor. I have only one excuse," he continued, with passion: "you came here as stranger to us, and I little thought what a treasure lay concealed near me. Since that, in our slight intercourse, you have awakened in me a feeling to which I yield irresistibly. It is seldom permitted me by fate to say undisguisedly what I feel. I disdain to use the impassioned language of a youth, for I do not wish to disquiet you. But do not think that I feel less strongly towards you because I know how to conceal my emotion."

Ilse stood in the middle of the room, and a burning color rose to her cheeks.

"I beg your Highness not to say another word, for it is not right that I should listen to you."

The Sovereign laughed bitterly.

"I have already wounded you, and you quickly make it plain that I labored under an illusion when I hoped for your affection. And yet I am so completely your slave, that I beg of you not to refuse your sympathy to a passion which glows so warmly within me, that it has at this moment entirely deprived me of my self-control."

Ilse gasped:

"I must away from here."

"Renounce that idea," cried the Sovereign, beside himself. "I cannot be deprived of your presence or of the sound of your voice. However slightly it may gladden me, it is the happiness of my days—the one great feeling in a life without pleasure or love. The knowledge that you are near me maintains me in my struggle against thoughts that stupefy me in gloomy hours. Like the devout pilgrim who listens to the bell of the hermitage, I listen to the slightest chord that vibrates from your life into mine. Consent to accept the devotion of a lonely man," he continued, more tranquilly. "I vow never more to wound your delicate feelings. I vow to be contented with that share of your life which you will freely give me."

"I repent of every word that I have spoken to your Highness, and I repent of every hour in which I have thought with reverence of you," exclaimed Ilse, with kindling anger. "I was a poor trusting child," she continued, excitedly. "I bowed submissively to my Sovereign before I saw him as he is; now that I know

him, he excites abhorrence in me, and I gather up my garment and say, Monster, begone from me!"

The Sovereign fell back in his chair.

"It is an old curse that echoes in my ears from these walls; it is not your own heart that drives me from you. From your lips should only come words of love and compassion. I am not a tempter, I am myself a wanderer in the wilderness, with nothing about me but desert sand and towering rocks. I hear the laughter of children; I see the fair-haired group passing by me; I see two eyes fixed on me with kindly greeting, and a hand, with the filled cup, which beckons to the weary one; and, like a vision of mist, it has all disappeared. I remain alone, and I sink to my destruction."

He closed his hands over his eyes. Ilse did not reply. She stood, turned from him, looking through the window at the clouds which flitted across the heaven.

All was quiet in the room. Nothing moved, and no one spoke. At last the Sovereign rose slowly: he approached Ilse. There was a glassy look in his eye, and he moved with effort.

"If I have wounded you by what I have said in a moment of overwhelming passion, forget it. I have proved to you that I am not yet free from the weakness that hopes to gain a heart which would beat in unison with mine. Remember only that I am an erring one who sought comfort from you. It was an humiliating request: if you cannot respond to it, do not be angry with the wretched one who asks."

He gazed on her with a long, protracted look of burning passion, deadly, wounded pride, and something more, that inspired her with terror, but she looked him firmly and rigidly in the face. He raised a warning finger, and left the room.

She listened to his tread as he went away, marked every step as he descended, and when he closed the house-door, pulled the bell.

Gabriel, who was standing in the anteroom, entered quickly.

"I wish to go away from here," exclaimed Ilse.

"Where to, Mrs. Werner?" asked the frightened servant.

"Where to?" echoed in Ilse's ears.

"To my husband," she said; but, as if listening to her own words, she shuddered. He also was in a house of the Sovereign. He was with the daughter of the wicked man. He himself was not safe there—his wife would not be safe with him. Where to? The question whirled in her head. The son of the cruel man was with her father, so she must not go home; her neighbour had said so. She sank her head as if stunned. A feeling of helplessness lay like a dead weight upon her; but she raised herself again, and

approached Gabriel. "I will leave this city to-day—at once."

The servant wrung his hands.

"I knew it would come to this," he exclaimed.

"You knew it," asked Ilse, gloomily; "and neither I nor my husband did? Was it seen to every passer-by, and yet a secret to him and me?"

"I noticed that there was something about this place that seemed uncanny," answered Gabriel, "and that no one trusted the distinguished gentleman who just now left. How could I tell you what seemed only my foolish fancy?"

"It is not well to pay too little attention to people's talk," replied Ilse; "I wish to go to some place where I can find a woman, Gabriel. Get a carriage for me immediately, and accompany me to Mrs. Rollmaus. We will leave everything here, and you must return to the house, that you may be on the spot when my husband comes back."

"Where shall I get a carriage?" asked Gabriel, hesitatingly.

"From the city, and not from the castle stable."

Gabriel stood and reflected. At last he said, abruptly:

"I shall go; be careful to prevent the lackey from learning that you are preparing for a journey."

"No one shall know it," said Ilse.

Gabriel hastened away, and Ilse locked the door and flew into the next room. There she collected all that was indispensable for the journey. She closed all the cupboards and wardrobes, and put the keys in a bunch. "When Felix comes, he shall not say I ran away unthinkingly." She went to his writing-table, and sealed up the letters in a packet. "So that no curious eye can look upon you," she said. When she packed up the letters of the children and her own answers, a shudder came over her, and she concealed the bundle rapidly beneath other papers. She was ready, and Gabriel had not yet returned. He seemed to linger long. With firm steps she went through the rooms. "You have grown more strange to me the longer I have dwelt here. What has become of the brilliant impression of the first evening? It was a cold splendor, hostile to my life. I would gladly root up every recollection of it from my soul." She placed herself on the spot where, in the night, she had looked on her sleeping husband. "That was my last sorrowful look at his dear face; when shall I see it again? I go from you, Felix; who would have thought it when we stood together before the altar? I leave you behind among wicked men; you also in danger, and I go away alone, to seek safety for myself far from you. Who would have said some days ago that I should have marked him a liar to his face? I go, Felix, in order to save myself for you. Think of that, and do

not be angry with me. I would not have gone for less cause." She sank down on a cushion, and wrung her hands with tearless sorrow. She lay for a long time in this condition. At last there was a knocking at the outer door. She jumped up and opened it, but she drew back terrified when she beheld the pale countenance of her faithful servant.

"I have not ordered a carriage," said Gabriel, "for it would be of no use."

"What do you mean?" asked Ilse, angrily.

"Any carriage that went from here would not take Mrs. Werner where she wishes, but only where another wishes."

"Then we will go ourselves, and take a vehicle in the city."

"Wherever we go," replied Gabriel, "we shall be observed, and if I attempt to call a carriage it will be taken from us."

"You are frightened yourself, Gabriel, and see danger where none exists," replied Ilse, annoyed.

"If we could only get an honest man to take you to Mrs. Rollmaus," continued Gabriel; "but it is doubtful whether you could get there. Do you see that man below by the castle? He goes slowly as if he were taking a walk, but he never turns his eyes from this house. That is one of our spies, and he is not the only one."

"Who has told you that?" asked Ilse.

"I have a good friend here who belongs to the castle," replied Gabriel, hesitating. "Do not be angry, Mrs. Werner, that I asked him, for he knows all their tricks. It is possible, he said that we may succeed; for one cannot assume that all the people of the city are robbers or deceivers, but it is uncertain and dangerous."

Ilse seized her hat and cloak.

"I am going, Gabriel," she said, quietly. "Will you accompany me?"

"Dear Mrs. Werner, wherever you wish," answered Gabriel. "But first listen to my proposal. My acquaintance thinks that the safest way would be, if the Crown Inspector should fetch you himself in the evening. The evenings are dark, and you may then perhaps be able to leave the house without the lackey or any one else remarking it."

"A prisoner!" exclaimed Ilse. "Who is your acquaintance?" she asked, looking sharply at Gabriel.

"He is true as gold," Gabriel assured her, "and I will willingly tell you later, but I beg you not to ask me to-day, for he has desired, for his own safety, that no one should be told."

"I trust in your faithfulness," replied Ilse, coldly; "but you yourself may be deceived; I will not follow the advice of a stranger."

"He has offered me a horse," said Gabriel, it is

outside the city. If you will give me a line to the Crown Inspector, I will ride there and bring the carriage in good time."

Ilse looked gloomily at the servant.

"Many hours must pass away, and I will not remain here alone. I will go on foot along the high road to my friends."

"Look, Mrs. Werner, at the sky; a storm is coming."

"I do not care for it," exclaimed Ilse; "it is not the first time I shall have gone through the rain. If you do not choose to accompany me, you may wait here for my husband, and tell him that I have gone away to my home, and when I am with good people I will write to him."

Gabriel wrung his hands; Ilse put on her cloak.

Suddenly loud altercation was heard on the floor below. Gabriel hastily opened the door; the bass voice of a stranger was scolding the lackey vehemently:

"But I tell you I am not the man who will allow the door to be shut in his face; she is at home, I say."

Ilse threw off her hat and cloak, sprang down the stairs, and called out.

"Mr. Hummel!"

"Your most obedient servant, Mrs. Werner," cried out Hummel. "I come immediately, only I will first express to this major-domo my high opinion of him. You are a scoundrel, sir, and an object to whom I wish such treatment as he deserves—a well-seasoned switch and a tight halter. I am coming, Mrs. Werner." He ascended the stairs heavily, Ilse flew to meet him, led him into her room, and was so overcome that she laid her head on his shoulder and wept.

Mr. Hummel was silent, and looked sympathizingly at Ilse.

"So these are Court ways?" he asked, softly; "and this is the fashion in which people act here?"

"My husband is away. I wish to leave this place; Mr. Hummel, do help me to escape!"

"That is exactly my situation," said Mr. Hummel: "I am implicated, myself, in an elopement affair. I have come to this city in order to convey to you a request from my daughter Laura, and to bring matters to some settlement with the clergymen here. But where do you wish to go to?"

"To kind friends who will take me to my father's house."

"That will certainly be the right course," replied Mr. Hummel.

"In times of despair, when everything totters in the world, the child should go back to the father. His faithfulness remains; she is twenty years old before that of the husband begins. As your father is not here, allow one who knows what it is to feel anxious about a child to take the place of a father to you."

Ilse clung to him : Mr. Hummel pressed her hand, after his fashion, tenderly ; but it was a hard pressure.

“ Now for composure and cool blood. It can be no small matter which moves you so strongly. I will not leave you until I see you well protected.” He looked at Gabriel, who made him a sign. “ Do not trouble yourself further in the matter. Be quietly seated, and allow me to confer with Gabriel. I will take care of everything for you, and I shall answer for everything.”

Ilse looked at him thankfully and seated herself obediently. Mr. Hummel beckoned Gabriel into the next room.

“ What has happened here ? ” he asked.

“ The master has gone away for a few days ; meanwhile Mrs. Werner has been treated in an unseemly way ; great wickedness is carried on here, and they will not let her go.”

“ Not let my lodger go ? ” cried Mr. Hummel ; “ ridiculous ! I have a passport to Paris in my pocket, we will skip over this country like grasshoppers. I will fetch a conveyance immediately.”

Gabriel shook his head. The confidants again conferred together. Mr. Hummel came back and said, with greater seriousness, to Ilse :

“ Now I must beg of you to write a few lines to the Crown Inspector—to the husband, not to his wife, otherwise there would be confusion. You must request him, immediately after the receipt of this letter, if he is willing to do a great kindness, to come here in a closed carriage, to stop in the suburb, at the Black Bear ; and he must not leave his carriage. Nothing further. This letter Gabriel will convey to him. How he does so is his affair, not ours ; if he chooses to fly, like this ambiguous genius on the ceiling, who has forgotten its overcoat, it will be so much the better. Now the letter is written, forgive me if I read it. All right and accurate—away, Gabriel, quickly. When you have passed the castle, then make speed : till then, act like a composed philanthropist. I will allow you to whistle my Dessauer, if you can. If they ask you any questions, say you are attending to some business for me.”

Gabriel hastened away. Mr. Hummel placed his chair in front of Ilse, and looked at his watch.

“ You will have to wait five hours for the carriage if all goes right. Meanwhile you must bear my company, I will not leave the house without you. Do not be troubled at the delay. I am glad of it ; for I wish to speak with you as with an honorable woman, to whom I can take off my hat with true respect, concerning my own affairs, which I have much at heart. We have time enough for it. I have also brought some papers to the Professor ; they are of little importance, but I will lay them on the table, and we shall sit oposite each other like people of business.

Then I should be glad if you would give that Judas in the servants' chamber a few instructions for me. Have the goodness also to take everything away that might lead him to suppose that you and I were going to elope.”

Ilse looked round her, undecided.

“ What shall I say to the man, Mr. Hummel ? ”

“ You are so good a housewife,” replied Hummel, politely, “ that I can leave entirely to you to decide what you will provide for me. I have been travelling the whole day,” and he made a significant gesture towards his waistcoat.

“ Ilse jumped up ; in spite of all her anxieties, she could not help laughing, and said :

“ Forgive me, Mr. Hummel.”

“ That is the right frame of mind,” replied Hummel ; “ there is no better remedy for tragic spirits than a well spread table. I beg, therefore that you will send not only for one plate, but for two. I could not eat if you were looking on. Believe me, Mrs. Werner, the noblest feelings are not to be depended on if an honest piece of bread and butter is not impressed on them as a stamp. It makes people calm and firm—and you will have occasion for these virtues to-day.”

Ilse rang the bell.

“ If the knave appears,” proceeded Mr. Hummel, “ mention to him my name and my firm. I do not generally travel incognito, and I wish not to be looked upon as a mystery here.”

The lackey appeared. Ilse gave him orders to fetch the necessary refreshment, and asked him how it was he had denied her dear landlord admittance.

The man stammered an excuse, and went away hastily.

“ When I came to the house I was aware that all was not right here. I asked after you at the castle and received no satisfactory answer. I asked a man at the back of the castle who was wandering about, which was your house. He looked at me like a cross-bill. You were travelling, he declared, and he tried to discover my secret. Thereupon there was a short conversation, in which cross-bill showed his spite because I in ignorance called him by his proper title of spy. The sentinel came up at this, and I saw that these jovial comrades had a great mind to arrest me. Then a young gentleman appeared, who asked the other the cause of the disturbance, and said he knew that you were at home. He accompanied me up to this house, asked my name politely, told me also his own, Lieutenant Treeclimber, and advised me not to be frightened away, that the servants were insolent, but that you would be rejoiced to see an old friend. He must be known to you.”

(To be continued.)

BOOK REVIEWS.

VIRGIL'S ÆNEID: The First Six Books Translated into English Rhyme. *Henry Hamilton*. New York: G. P. Putnam's Sons.

"The differences in the two languages," says Mr. Hamilton, in the preface to his translation, "render it impossible for many of the beauties of the Latin to be reproduced in our own tongue." Mr. Hamilton has therefore chosen to present, so far as possible, the spirit of the original "by resort not to the same, but equivalent expedients." Thus, by the frequent employment of alliteration, Mr. Hamilton seeks to produce the same effect that a different metre and a different artifice, or perhaps the same artifice, produced in the original. We instance the passage where, in Book I, Juno repairs to the retreat of Æolus and his winds; where the God of blasts binds his turbulent servants with heavy chains; where, unwilling, as Mr. Hamilton translates,

"With rumbling rage round the rough rocks they roar."
Ille indignantes magno cum murmure montis.

The well-known line, *tantæne animis celestibus iræ?* Mr. Hamilton renders:

"Within celestial minds is such fierce fury found?"

Mr. Hamilton has adopted an expedient, highly calculated to impart variety and charm to his translation, of changing the measure of the verse with each recurring speaker. By this means, the characters of the poem acquire individuality; the metre is adaptable to the caste of mind and the manner of expression peculiar to each. In most instances the choice of measure has been a fortunate one, comports with the tone of utterance and the circumstances of address. We may quote, as illustrative of Mr. Hamilton's skill and careful versification, the following few lines, introductory to the description of the memorable chase:

"Meantime Aurora's steeds from ocean rise,
And breathe the morning beams along the skies;
Forth from the gates the chosen band appears
With toils and meshes and broad-pointed spears,
While bounds keen-scented, and Massylian horse,
And brawny huntsmen, range in royal force.
The Punic nobles at the portal wait
The queen, who at her toilet lingers late;
In gold and purple trapping stands her steed,
And champs the foaming bit impatient to be freed.
At length she comes, by a long train attended,
Clad in a chlamys of Sidonian kind;
A golden quiver on her back is bended,
In golden knots her tresses are confined,
And her purple robes do golden hackles bind.
Sprightly Iulus and the Trojan bands
Join the bright concave; while Æneas stands
Towering in manly beauty half divine,
Or mingling gaily with the moving line.
As when Apollo leaves the Lycian lands
And Xanthic floods bound up in wintry bands,
To see again his native Delian isle
And lead anew the choral dance, the while
Cretan and Dryop chant his shrine around,
And painted Agathyrsians swell the sound;
Himself along the lofty Cynthian height
Majestic moves, his floating tresses bright
Crowning with leafy wreath, or with fine gold
Pausing his loosened locks to interfold,
While his darts rattle on his shoulders: so,
Not less full pulsing doth Æneas go,
And such grace mantles o'er his noble mien.
Soon pathless lairs and mountain heights are seen,
And lo! from craggy cliffs wild goats down-leap,
Yet in their flight the rocks and ridges keep;
While stags o'ersecour the plains in headlong course,
Fleeing the mounts to join their dusty force.
Ascanius gallops on with rising joy:
Now these, now those, outrides the daring boy,
Wishing a foaming boar might cross his way,
Or tawny lion offer mightier prey."

We have chosen at random. The work has many passages that indicate marked poetical talent and a scholarly adherence to

the original. Undoubt'edly the translation of Mr. Hamilton will find favor among English readers of the great Roman poet.

Early in June, Longmans, Green, & Co. will issue in New York the first number of *The New Review*, an English monthly started by Mr. Archibald Grove, a young Oxford man. Three Americans, Lady Randolph Churchill, Mr. Henry George, and Mr. Henry James are among the contributors to the first number.

"Protestantism in the Middle Ages," (*Le Protestantisme au Moyen Age*), is the title of a discourse by M. E. Doumergue, held at the Montauban commencement, 1888-89. M. Doumergue is a fervent, faithful theologian. His sketch is spirited, and replete with forcible rhetorical turns.

"The Objects of the Science of Ethnology," (*Die Ziele der Ethnologie*), a lecture held by Dr. Franz Boas, before the German Gessellig-Wissenschaftlicher Verein, of New York City, is a review of the present state and purposes of ethnological research. The study is comparatively recent, yet its acquisitions—the results of the enthusiastic labors of Tyler, Bastian, Morgan, Bachofen, and others—have already exerted a marked effect upon the course of modern thought. Ethnology bids fair to be the foundation of all sociological and comparative science. (H. Bartsch, 87 Frankfort Street, New York.)

NOTES.

Dr. Carus will sail for Europe on May 25, to return in August. During his absence, the editorial management of THE OPEN COURT will be conducted by Mr. Thomas J. McCormack.

We have heard with deep regret of the death of Dr. Samuel Hirsch. His life has been one of active religious effort, and his career one of marked distinction.

The essay of Mr. Moncure D. Conway upon "The Transient and Permanent in Theodore Parker" will be followed by two others upon the same subject.

Ludwig Noiré, the eminent German philologist, whose conspicuous services in the province of philosophy and linguistic science have won him merited scientific renown, died at his home in Mayence, in the latter part of March.

Emerson was eminently monistic. "Once," he says, "men thought spirit divine and matter diabolic: one Ormuzd, the other Ahriman. Now science and philosophy recognize the parallelism, the approximation, the unity of the two: how each reflects the other as face answers to face in a glass; nay, how the laws of both are one, or how one is the realization."

As an appropriate accompaniment to Prof. Gunlogsen's prose adaptation of the Sanskrit poem "The Sitaharanam," the second chapter of which is published in the present issue of THE OPEN COURT, we have reproduced and printed the opening lines of the episode in the original Sanskrit characters. The Devanagari alphabet—that in which Sanskrit is written—is supposed by many Oriental scholars to be of Semitic origin. It was not employed in India until the time of king Acoka—probably about the seventh century before Christ.

Simultaneously with the publication of this week's OPEN COURT, will appear a new work by Dr. Paul Carus, entitled, "Fundamental Problems. The Method of Philosophy as a Systematic Arrangement of Knowledge." The work is, in main, an amplification of the series of philosophical essays which during the past two years appeared in the editorial columns of THE OPEN COURT. The important additions that have been made, the re-arrangement of the subject-matter showing the progressive and constructive character of the method, and an exhaustive index, will render the volume a valuable companion-book to readers of THE OPEN COURT.

OPEN COURT CLUBBING RATES.

The following rates are offered to all who wish to subscribe for *The Open Court* and any one of the magazines in the list subjoined. If more than one be desired, they may be obtained through our office at the price stated in the first column, allowing a discount of 10 per cent on all orders amounting to \$10.00 and over. Each periodical sent with *The Open Court* for the price stated in the second column. Money must accompany all orders.

THE TEACHER'S OUTLOOK.

Published by The Teacher's Publishing Company, Des Moines, Iowa. A monthly magazine devoted to the interests of teachers and advanced pupils and intended to supplement the good work done by other school journals rather than to occupy the same field. Instead of filling its columns with school methods, school aids, and the details of school work, it will aim to interest the teachers in matters outside of the atmosphere of the school room, and its columns will furnish an *Outlook* upon affairs of life, facts in science and nature which illustrate and test the theories of the schools. In this work it will hope to furnish the teacher with a natural source of inspiration and mental energy, quicken thought and make the school room a place joyous with buoyant spirits that offer a responsive greeting to the inquiring minds of youth, rather than heavy with that gloom and dullness which often surrounds the daily toil.

A leading feature of the magazine will be a monthly review of current events, civil and industrial problems, scientific inventions, discoveries, etc.

Another feature will be a very complete Review of current Literature, especially of all books and magazines coming within the sphere of its labor. We have entered into arrangements with all the leading publishers to keep us informed of all their new and prospective publications, and the Reviews will be made by competent critics.

Still another feature, and a very important one as giving a practical value to the *Outlook* offered, will be the formation of a circle of writers out of its subscribers, from which it hopes to draw its corps of contributors. This plan is original as applied to a magazine, and is based on the idea of co-operation, or mutual helpfulness. If met with that appreciation necessary to its full execution it will be the means of introducing many new writers to the public, and of aiding many who now lack the training in the expression of thought necessary to a kindly reception in the field of literature into which their tastes would lead them. For further particulars send four cents for Prospectus, or fifty cents for magazine eight months. 112

NEW PUBLICATION.

**THE
Psychic Life of Micro-Organisms**

A STUDY IN EXPERIMENTAL PSYCHOLOGY
By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects:-

1. *The Psychology of the Cell*—Introductory.
2. *The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.*
3. *The Psychology of Nutrition: Holoptychic, Saprophytic, and Animal Nutrition: Predatory Habits of Certain Animalcula.*
4. *Colonies of Unicellular Organisms.*
5. *Reproduction of Proto-Organisms.*
6. *Reproduction of Higher Animals and Plants.*
7. *The Physiological Function of the Nucleus.*
8. *Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.*

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instanced, apart from the author's original investigations, the researches of *Baldani, Cleschke, Leuckmann, Haeckel, Ribot, Haeckel, Engelmann, Espinas, Pouchet, Weber, Pfeffer, Kent, Dujardin, Gruber, Nussbaum, Bittlich, Lieberkühn.*

In a preface written especially for the American edition, M. Binet compares the theory of the English scientist, Dr. G. F. Romanes, that the first appearance of the various psychical and intellectual faculties is assignable to different stages in the scale of zoological development.

16 mo, 135 pages. Cloth, 75 Cts. Paper, 50 Cts.

OPEN COURT PUBLISHING COMPANY,
P. O. Drawer F., Chicago, Illinois.

TO ADVERTISERS!

For a check for \$20 we will print ten-line advertisement in One Million issues of leading American Newspapers and complete the work within ten days. This is at the rate of only one-fifth of a cent a line, for 1,000 Circulation! The advertisement will appear in but a single issue of any paper, and consequently will be placed before One Million different newspaper purchasers; or FIVE MILLION READERS. If it is true, as is sometimes stated, that every newspaper is looked at by five persons on an average, Ten lines will accommodate about 75 words. Address with copy of Adv. and check, or send 80 cents for Book of 256 pages.
GEO. F. ROWELL & CO., 10 SPRUCE ST., NEW YORK.

We have just issued a new edition of our Book called "News for Advertisers." It has 256 pages, and among its contents may be named the following Lists and Catalogues of Newspapers: DAILY NEWSPAPERS IN NEW YORK CITY, with their Advertising Rates. DAILY NEWSPAPERS IN CITIES HAVING MORE THAN 150,000 POPULATION, omitting all but the best. DAILY NEWSPAPERS IN CITIES HAVING MORE THAN 100,000 POPULATION, omitting all but the best. A SMALL LIST OF NEWSPAPERS IN WHICH TO ADVERTISE every section of the country: being a choice selection made up with great care, guided by long experience.

ONE NEWSPAPER IN A STATE. The best one for an advertiser to use if he will use but one. BARGAINS IN ADVERTISING IN DAILY Newspapers in many principal cities and towns, 4 lines which offers peculiar inducements to some advertisers.

LARGEST CIRCULATIONS. A complete list of all American papers issuing regularly more than 25,000 copies.

THE BEST LIST OF LOCAL NEWSPAPERS, covering every town of over 5,000 population, made up with great care, and of very important county seat. SELECT LIST OF LOCAL NEWSPAPERS, in which advertisements are inserted at half price.

500 VILLAGE AND NEARBY PAPERS. In which advertisements are inserted for 12 1/2 cts. a line and space in the whole lot—only one-half of all the American Weeklies. Book sent to any address for THIRTY CENTS.

Fundamental Problems.

The Method of Philosophy as a Systematic Arrangement of Knowledge.

By Dr. PAUL CARUS.

PRICE, ONE DOLLAR.

To Subscribers of THE OPEN COURT, 75 Cents.

*No Agnosticism but Positive Science,
No Mysticism but Clear Thought,
Neither Supernaturalism nor Materialism,
But a Unitary Conception of the World,
No Dogma but Religion,
No Creed but Faith.*

From the principle of positive philosophy indicated in the title, the author objects to Supernaturalism as well as Agnosticism. He proposes a unitary conception of the world on the basis of facts and discusses the most vital questions of philosophy and ethics; among them the problems of—*Formal Thought (Kant's Apriori)—Causality—The Origin of Life—Absolute Existence—Space and Time—Infinite and Eternity—Free Will—Ethics and Natural Science—The Importance of Art.*

MAKING BREAD DEAR.

A CONTROVERSY BETWEEN
WHEELBARROW and SYMPATHIZER

UPON

Corners and The Board of Trade

WITH REFERENCE TO

THE LABOR QUESTION.

PRICE, 10 CENTS.

This little pamphlet is a reprint from the columns of THE OPEN COURT of an able and spirited controversy between Wheelbarrow and a prominent Chicago financier. The title indicates the subject. Wheelbarrow attacks the combinations of trade that "make bread dear and laborers cheap." Sympathizer declares Wheelbarrow's article a misrepresentation of facts, and characterizes it as misleading and obscure. Wheelbarrow replies, explains more fully his position, and contends that the arguments of Sympathizer have only strengthened the stand he has taken. The discussion is by practical men, and forms an interesting chapter in economics.

DEFINITIONS EXPLANATORY OF THE POSITION OF
"THE OPEN COURT."

THE DATA of experience are perceptions.

REALITY is the sum total of all that is.

TRUTH is the conformity of cognition to reality.

[Truth being a relation between subject and object appears to be relative in its nature. Absolute truth is a self-contradiction; it would imply cognition without a cognizing subject.]

At the same time it is obvious that absolute existence (in fact everything absolute) is impossible. Reality is properly called *Wirklichkeit* in German, derived from *wirken*, to take effect. Reality is not immovable and unchangeable absoluteness, but the effectiveness of things in their relations. Reality therefore implies not only existence, but the manifestation of existence also. Existence and its manifestation are not two different things; both are one.

The idea of something absolutely Unknowable is therefore also untenable; it would imply the existence of an object whose existence is not manifested *i. e.*, existence without reality; *Sein ohne Wirklichkeit*—which is a contradiction, an impossibility.]

MONISM is that philosophy which recognizes the oneness of All-existence, and the Religion of Monism teaches that the individual, as a part of the whole, has to conform to the cosmical laws of the All.

RELIGION is man's aspiration to be in harmony with the All.

[Religion has been defined differently in the columns of THE OPEN COURT, but all definitions that have been presented are in strict agreement. Mr. Hegeler in No. 25, defines Religion as "man's union with the All" (taking the definition from the Lutheran Catechism "Religion ist der Bund des Menschen mit Gott durch Gott," and replacing the Word GOD by the more comprehensive word THE ALL). The editor has defined Religion as "man's consciousness of his relation to the All" (No. 24); as "Das Allgefühl im Einzelnen," the All-feeling in the individual (see foot-note page 965); as "man's conception of the world that serves him as a guiding-star through life" (page 1180).]

MORALS are man's conduct in so far as it is in unison with the All.

[The basis of morality is religion. A moral educator or preacher may justly be asked, "On what authority dost thou justify thy precepts?" And he will tell us that his authority is not personal; he speaks in the name of universal order. Accordingly his authority is that of religion. If it were not so, all his good precepts would have no foundation; they would hover in the air like beautiful dreams that have no reality.]

ETHICS is the Science of Morals; it teaches man why he must, and how he can, regulate his conduct so as to be in unison with the All.

Natural history and the history of mankind prove that here on earth a constant progress takes place developing ever higher forms of existence.

Morally good are those acts which are in harmony with the All, *i. e.*, those which enhance progress, and *morally bad* are those which are not in harmony with the All, *i. e.*, those which retard or prevent progress.

[Religion (man's aspiration to be in unison with the All) has naturally produced many superstitious notions in the world, of its origin, and of its purpose. Similarly, science (man's search for truth) has produced many errors or false notions of reality. But all the superstitions of religion do not prove that religion as such is an illusion, and all the errors of science are no evidence that science as such is a sham.]

It is obvious that religion and science, as here defined, are not contradictory to, but complementary of, each other. If religion and science do not agree, it is a certain sign that our conception of either the one or the other is wrong. The history of the human mind has been one of constant conflict and reconciliation between religion and science. Their relation has repeatedly been disturbed and re-adjusted.

The unitary conception of the world affords the only basis for the union of Religion and Science, and opens a new vista of progress for both.]

REVIEW OF RECENT WORK OF "THE OPEN COURT."

The work of THE OPEN COURT, for the past six issues, covers a wide range of subjects. In an article in No. 87, "The Universal Faith," Mr. T. B. WAKEMANN, of New York, discusses the foundations of a "monistic, positive, human, constructive religion." In the number preceding, an editorial essay points out and emphasizes the radical difference between religious Creeds and religious Faith. Then follow in Nos. 87, 88, and 89, respectively, the articles, "Agnosticism and Auguste Comte's Positivism," "Space and Time," "Formal Thought and Ethics"; the first of which derives additional interest from its bearing upon the controversy now raging between the Agnostic and Comtist philosophers of England; the two latter being essays in a constructive philosophical series. "Personality, Individuality, Conscience," is the title of an essay (No. 87) by M. TH. RIBOT, the eminent French psychologist, translated with his consent from *Les Maladies de la Personnalité*. It contains the gist, one may say, of the principles from which modern psychology sets out. Dr. FELIX OSWALD contributes, in No. 88, a paper on "Dreams and Visions," an interesting study; and in No. 89, Mr. A. H. HEINEMANN writes effectively upon "The Preservation of Moral Purity in Children." Thus much for Science and Ethics.

In criticism, appears the striking article from the French of ALFRED FOULLEE, entitled, M. GUYAU'S Faith; in this essay the doctrines of the poet philosopher are presented as he propounded them in his conceptions of art, morality, and religion. The paper "The Transient and the Permanent in Theodore Parker" (No. 91), is Part I of a discourse held by Mr. MONCURE D. CONWAY at the dissolution of Mr. Parker's Society; it is a bright and comprehensive sketch of Mr. Parker's work and of the intellectual activity of his time. Three articles (Nos. 90, 91, 92,) upon "The History of the People of Israel" are worthy of every reader's careful perusal. The author, Prof. CORNILL, is an orthodox theologian of Königsberg; his researches are marked by critical acumen, spirit, and above all, a love of truth. A unique feature of the last few numbers is "The Sitaharanam," an Episode from a Sanskrit Epic, translated into English prose by Prof. ALBERT GUNLOGSEN.

In Economics, the controversy between "WHEELBARROW" and "SYMPATHIZER," Nos. 78, 85, 86, 88, occupies the first place. The subject is "Making Bread Dear"; the discussion embraces "Corners," "Board of Trade," and "The Labor Problem." WHEELBARROW is well known to readers of THE OPEN COURT; SYMPATHIZER is a prominent Chicago citizen. The whole is now published in pamphlet form.

The Open Court.

A WEEKLY JOURNAL

Devoted to the Work of Conciliating Religion with Science.

THE CONQUEST OF PALESTINE AND THE FOUNDING OF THE KINGDOM OF ISRAEL.

BY PROFESSOR CARL HEINRICH CORNILL.

Translated from the German by 772.

It would be erroneous to suppose that the whole land of Palestine, directly upon occupation, became the undisputed possession of the Israelites. In the first chapter of the Book of Judges—one of the most important and valuable of extant historical documents—we possess a detailed enumeration of all the Canaanites whom Israel “did not drive out.” From this enumeration it appears, that the best and most fertile parts of the country, and above all, the majority of the cities—with their strong fortifications, at all times impregnable to the rude military art of the Israelites—remained in the possession of the Canaanites. Only the forest-covered mountain ranges of Middle and Northern Palestine were occupied by Israel; and a very long and obstinate work had still to be performed before the Canaanite population was finally subjugated; a task partly accomplished by force of arms and the imposition of tributes, and partly by peaceable conquest and absorption with the people of Israel.

It must be admitted that to Moses and his work Israel was indebted for the power with which through ages it struggled victoriously in full consciousness of the high aim that was to be attained. Moses had given to the people a nationality and therewith an inalienable palladium, which, purified and strengthened by the power of religion, could not submit to oppression, but marched conquering onward; it was owing to Moses alone that in Canaan Israel did not become Canaanites, but, on the contrary, that the Canaanites were transformed into Israel.

Indeed, the actual outcome of the protracted conflict between these two peoples and different nationalities, had not, to human calculations, by any means been absolutely certain. In Canaan Israel passed from a nomadic to an agricultural life, and might not such a radical change of life and of its conditions easily have brought about a transformation of national character? Irrespective of the superior culture and number of the Canaanites, Israel certainly harbored within itself a very dangerous foe, and a living germ of disorganisation; *viz.*, the stubborn, stiff-necked feeling of independence and the strong family

instincts, peculiar to nomads, that still clung to the national character after the people had abandoned nomadic ways of life. Even after the common effort under Joshua had partially laid the foundations of national organization, the people were once again broken up into families and tribes, who without concerted action and without discipline, planlessly and aimlessly sought localities in which to settle down. Tradition, also, has expressly handed down a number of peculiar features of this tribal and family history.

One fraction of the tribe of Manasseh,—the families of Jair and Machir—conquered the region to the east of lake Galilee (4 Mos. xxxii. 39-41; 5 Mos. iii. 14-15; Judg. x. 3-5)—a fact of the greatest importance, because thereby there was reestablished a connection between the West-Jordan country and Gilead, as the Israelites called the East-Jordan region. The tribe of Dan in its struggle against the powerful and warlike Philistines, had failed to secure a permanent settlement in the fertile plain along the coast of the Mediterranean; but Dan thereupon conquered the city of Laish in the far off north on the slopes of Mount Hermon, and changed its name into that of Dan (Judges xvii. and xviii.; compare also i. 34). Shamir, on Mount Ephraim, was settled by the family of Tola of the tribe Issachar (Judges x. 1-2); Pirathon, in the same locality, by the family of Abdon (Judges xii. 13-15); Aijalon by the Zebulonite family of Elon (Judges xii. 11-12). This dispersion might have proved injurious and even ruinous, if over all of them, each family and each tribe, there had not reigned supreme one common idea; namely, Jahve, the God of Israel.

Jahve was the only national principle, the only bond that bound together all Israelites; in fact, as Jahve's own people they were a nation. Only extreme emergency had been able to effect a national union, and that not a general, but merely a transient one.

After Joshua's victories, the Canaanites, through the concentration and straining of all their resources, seem to have made but one single effort to overcome the invaders. Under the leadership of Sisera there was effected a powerful coalition of Canaanite kings, which undertook a war of extermination against Israel. This war of extermination threatened to be realized to the fullest extent. The Israelites were forced to seek

hiding-places in the woods and in the mountains, where they stayed until Jahve finally brought assistance. At this critical moment a divinely inspired woman, the prophetess Deborah, aroused the discouraged Israelites. Under the leadership of Barak, of the tribe of Issachar, 40,000 Israelites of the tribes of Ephraim, Manasseh, Benjamin, Zebulun, Issachar, and Naphtali assembled together, and now the power of the Canaanites was unable to resist the ardent impetuosity of that great host, fighting for Jahve. At Taanak, on the river Kishon, the Canaanite army was defeated and dispersed, and Sisera himself in his flight murdered by a woman (Judges iv. and v.). After this battle we never again hear of resistance on the part of Canaanites.

Israel at last enjoyed rest from the Canaanites; but now there threatened still another foe. Kindred tribes looked with envy upon the success of Israel, and naturally coveted their own share of the Canaanite prey. Thus Moab even advanced across the Jordan, and at Jericho, its king, Eglon, received the homage and tribute of the tribe of Benjamin, until the Benjaminite Ehud stabbed Eglon and freed his people from the foreign yoke (Judges iii. 12-30). Likewise Ammon advanced toward the Jordan, and the hard-pressed tribe of Gad was only saved through Jephthah's valor (Judges xi.). At the very time when in Canaan Israel was becoming an agricultural people, the nation constantly suffered from the hostility and rapine of the sons of the desert; Amalekites, Midianites, Ishmaelites, all of them sought to enrich themselves at the expense of the Israelite husbandman, and to rob him of the fruits of his labor.

The fact that bands of Midianites advanced, killing and plundering, as far as Mount Tabor, far in the north, in the vicinity of Lake Galilee in the West-Jordan region, is in itself a telling proof of how defenceless Israel remained through its unfortunate disunion against these predatory sons of the desert.

This invasion of Midianites, moreover, had certain important consequences. From sheer arrogance and wantonness the Midianites had on Mount Tabor butchered a number of prisoners belonging to the noble Manassite family of Abiezer. Then Gideon or Zerubbaal, the head of the family, took to arms to wreak vengeance of blood on the murderers. He assembled his own household and retainers, to the number of 300, and with these went in pursuit of the departed Midianites. He overtook them far beyond the Jordan; he succeeded in dividing the forces of the enemy, and took prisoners the two Midianite kings, Zebah and Zalmunna, whom he ordered to be executed in expiation of his murdered brothers. He thereupon punished the inhabitants of Succoth and Penuel, who had scorn-

fully refused him their assistance in this expedition of revenge (Judges viii.).

The conclusion of the narrative concerning Gideon has, unfortunately, been mutilated. It must have related, that Gideon actually founded a tribal kingdom, erected in his ancestral city of Ophrah a golden image of Jahve, and held a regular court, with a number of female retainers.

Thus from the house of Joseph proceeded the first attempt at political concentration—the foundation of a dynastical kingdom; and, perhaps, from this dynastical kingdom there might have been developed a folk-kingship—but the time for this had not yet arrived.

Gideon, during his lifetime, remained in the undisputed possession of power over Joseph; but after his death the harem-regiment—that constant curse of all oriental dynasties—likewise effected the ruin of his house. Abimelech, the son of a woman of noble birth from the city of Schechem—at the time a thoroughly Canaanite city—with the aid of his Schechemite retainers, seized the supreme power, attacked Ophrah and slew his brothers—according to tradition, three score and ten in number—upon one stone; only the youngest escaped. This event, naturally, was not of a kind to cause kingship to strike deep roots in the heart of the people of Israel.

Abimelech enjoyed the usurped power for only three years, when he became involved in difficulties with the men of Schechem. He also played the part of an Israelite king to the city of Schechem, which scarcely proved agreeable to the proud Canaanite nobles. They openly revolted against him; in consequence of which event he conquered Schechem and razed it to the ground. But fate overtook him at Thebez, upon which city he had wished to bring the same ruin. In the act of setting fire to a tower, into which the inhabitants of Thebez had fled for shelter, a woman from the roof of the structure hurled a mill-stone upon his head, and he was killed (Judges ix.). Thus the first attempt to found an Israelitic kingdom had ended in murder and conflagration.

Again the old anarchy prevailed, the old lack of cohesion, which the Book of Judges describes in the following words: "In those days there was no king in Israel, but every man did that which was right in his own eyes" (Judges xvii. 6; xxi. 25).

Incidentally, it may be observed, that it is simply impossible to give even an approximate chronological statement and arrangement of the events between the exodus from Egypt and the reign of Saul. If Merenptah was the Pharaoh of the exodus, we may place them in the interval between about 1300 to about 1030; the year 1017 as the year of Saul's death seems tolerably certain.

The kingship of Gideon, like a will-o'-the-wisp, had

vanished from sight, and been followed by utter darkness over the land of Israel. This darkness is only cleared up by the subsequent events that brought about the solid foundation of the national kingdom. The national kingdom had become an absolute necessity. An orderly government, popular feeling, and nationality could only be preserved through the concentration in some strong hand of all the scattered and, consequently, weakened national energies.

The notion that the creation of a purely human kingship would be a grievous sin, because an apostasy from Jahve, the only legitimate king of Israel, is but a later assumption of Hebrew theological schools, and discoverable for the first time, with certainty, in the prophet Hosea. This idea was entirely unknown to the olden time. The oldest sources relate all these events with a rejoicing and thankful spirit; in the rise of the national kingdom they justly beheld a signal proof of the grace of Jahve; a direct, divine interposition of Jahve for the redemption of his people.

On the present occasion, the troubles arose from a different direction, and were by far more serious than any former had been. To the southwest of Mount Ephraim, toward the Mediterranean, there dwelt the warlike and valiant race of the Philistines—the hereditary foe of Israel. The Philistines profiting by the helplessness of Israel, advanced toward the mountain and invaded the fertile plain of Jezreel. The first collision between the belligerents, at Ebenezer, proved calamitous to Israel. Then Israel, in order to secure the assistance of Jahve, fetched out of the temple at Shiloh the Ark of the Covenant, the ancient and sacred war-symbol of the house of Joseph; but the second battle turned out even more disastrous. Thirty thousand Israelites covered the field of battle, the Ark of the Covenant was captured, and the power of Joseph had been utterly broken (1 Samuel iv.). The Philistines dragged the Ark of the Covenant as a trophy of war into their own country, burned and destroyed the temple at Shiloh, and conquered the whole land of Israel to the bank of the Jordan; the people were disarmed and held in awe by Philistine viceroys and Philistine strongholds. Thus Dagon had triumphed over Jahve.

But Jahve had not forsaken his people; through the trying fire of extreme need and suffering he wished to weld it together to a strong and united nation. An aged seer, Samuel by name, had discovered in the Benjamite Saul the man of the period, and had kindled in his heroic soul a spark of patriotic enthusiasm. Just at this time the Ammonites also insolently insulted Israel, and threatened the city of Jabesh, in Gilead. Then Saul slaughtered a yoke of oxen and sent the bleeding pieces throughout Israel with the following message: "Whosoever cometh not forth after Saul, so

shall it be done unto his oxen!" A desperate host then assembled around the bold leader; the enemies were taken by surprise and scattered to the winds.

The people, exultant over this first victory after long servitude and shame, bore the fortunate general in triumph to the ancient sacred spot of Gilgal, there to place upon his head the royal diadem (1 Samuel ix.—xi.).

Saul owed his crown to his sword, and his whole reign was one uninterrupted strife; for the main point was, to become master in his own land, and to secure it against determined enemies and overweening neighbors. Saul at once addressed himself to the more difficult and more important task of throwing off the yoke of the Philistines. His son, Jonathan, slew the Philistine governor, who held his court at Gibeath, and at this signal of revolt the Philistine armies again poured into the insurgent land of Israel. Saul could only muster 600 men who had remained with him; but the lofty consciousness of fighting for home and hearth, for freedom and honor, imparted heroic courage to the men of Israel; Jonathan, above all, performed wonders of bravery, and, after a hot contest, victory declared itself for the desperate little band (1 Samuel xiii.—xiv.).

Yet this success was only a transient one. Saul regarded as his main task to keep in constant readiness the fighting strength of his people, and to this end he assembled about his person a small standing army, made up of 3,000 of his boldest subjects. Thus the star of King Saul arose at the beginning, bright and brilliant, but very soon it was overcast by dark clouds.

An "evil spirit from God" suddenly saddened the heart of the king. His attendants called to his side the Judean David, from Bethlehem, a man of tried courage, a skilled performer on the harp, a knight and troubadour in one, who, by his pleasant art, was expected to dispel the melancholy of the king. This new actor on the stage of Israelitic history is, next to Moses, the greatest personage of ancient Israel; for him had been reserved the glory of completing the work of Moses. What Saul began, David executed to its fullest extent; outwardly he made Israel free and independent, and inwardly united; the political and national consolidation of the people of Israel is the work of David.

David was one of those divinely endowed natures that win the hearts of all; a born ruler, to whom all willingly submit, and serve with alacrity. He appears before the king as a highly attractive figure, graced with every ornament of mind and body—radiant with youth, beauty, and strength; by his bewitching amiableness commanding the love of all. At first everything went well. Saul, too, could not resist the

magnetism of his person ; he made him his armor-bearer, his squire or "aide," and while David became devotedly attached to Saul's son, the king gave him his daughter in marriage.

This state of harmony, however, was not destined to last long. The Philistines again invaded the land and, during the war that ensued, David distinguished himself to such an eminent degree, that even the glory of the king was overshadowed. At that time of history kings had also to be the bravest of their nation, and we therefore easily understand that gloomy jealousy now began to devour the melancholy heart of the suspicious monarch. In a fit of sullen dejection once, he even hurled a javelin at his son-in-law, and the latter fled his presence. From that instant Saul's good genius forsook him forever, and the close of his reign exhibits a sad picture of civil strife and external troubles.

Despite the critical condition of his kingdom Saul, with an armed retinue, pursues the fleeing David, and, finally, drives him out of the country. The hounded fugitive was at last compelled to seek refuge among the Philistines—the enemies of Israel. Within a year and four months from that time, fate had overtaken the Israelitic king. The Philistine host again combined against Israel. A decisive battle was fought on Mount Gilboa, in which Israel was utterly routed. Saul, beholding the death of his three sons, fell, in a fit of despair, upon his own sword. Such was the untoward end of the first king of Israel.

Saul is a truly tragical figure. Although endowed with a grand and noble disposition, chivalrous and heroic, fired with ardent zeal, yet, after all, he had achieved next to nothing. At his death the condition of things had again become the same as at the time of his accession ; Israel lay prostrate, and the power of the Philistines was greater and firmer than ever before. Saul's failures must be attributed mainly to his moral disposition. He was more of a soldier than a ruler. He lacked the commanding personality, the inborn power of leadership, and still more so, the versatile, statesmanlike talent that David possessed. Saul had honestly performed his kingly duties ; when attacked, he returned blow for blow with telling vigor ; but he was far from being a creative, organizing genius. Above all, he lacked, to a deplorable extent, all sense and appreciation of the essential character and national *raison d'être* of the people of Israel. In this latter respect, tradition has handed down a clearly drawn portrait of Israel's king.

Saul was well on the way toward changing Israel into a secular, military state, and thus turning the nation from its true historical mission. A conquering kingdom of this world, perhaps, might have boasted a brief period of transient splendor and prosperity ; but

it would have disappeared, without leaving a trace of its existence, like Egypt and Assyria, Babylonia and Persia, Media and Lydia. King Saul, certainly, is entitled to our deepest compassion and heart-felt sympathy, but the fall of his dynasty was fortunate for Israel.

Yet not unavenged was Saul's blood shed on the heights of Gilboa ; his avenger and the genuine performer of his life-work arose in the Judean whom he had attacked and persecuted. Cautious conduct was now necessary on David's part. It would have been worse than foolhardy with only 600 Judeans to open war with the Philistines. Above all David wished to save what still might be saved. He therefore caused himself to be anointed hereditary king of Judah, under Philistine suzerainty ; while Abner, Saul's general, assembled the scattered remnants of Saul's power in the East-Jordan country, and at Mahanaim made young Ishbosheth king ; the latter was Saul's only surviving son, and probably not yet of age.

David resided seven years in Hebron and Ishbosheth likewise seven in Mahanaim. Abner made the attempt to subject David to the sceptre of Ishbosheth, but in this attempt he was completely foiled by the bravery of David's Judeans. Shortly afterwards Abner, the only support of the house of Saul, was murdered and Ishbosheth himself fell a victim to the vengeance of blood ; and at this conjuncture the northern tribes agreed to confer upon David the government of the lands of Saul.

Even the first measure enacted by David as over-king of Israel bears witness to his high statesmanly genius. The city of Jebus remained still in the hands of the Canaanites ; David conquered this city and made it the political capital of the new kingdom. This city was strongly fortified by its natural surroundings, situated rather toward the middle-region of the kingdom, and while independent of any of the tribes, and raised above and beyond their petty rivalries, it was better adapted for the purpose intended than any other city. As a characteristic contrast to this policy, Saul, even as king, had quietly continued to reside in his native village. The founding of Jerusalem, as David called his new "city of David," was a fact of the greatest historical importance, when we bear in mind what Jerusalem became to the people of Israel and later through Israel to humanity.

Now, at last, the eyes of the Philistines were opened at their former loyal vassal, and they endeavored to choke, at its very birth, the rising power of David—but in vain. The task upon which Saul had been wrecked, was accomplished by David, and indeed definitively. David for all coming ages made the return of the Philistines an impossibility, yet, on the other hand, he did not molest them in their own

country; did not rob them of a single inch of land or take a single stone from their fortresses.

David figures as the greatest warrior of ancient Israel. Victory ever remained faithful to him; he humbled all the neighbor-nation's or conquered them—but we must particularly lay stress upon the fact, that David waged all his brilliant wars only in order to repel unprovoked attacks, and in defense of the most vital interests of his people. It cannot be proved, or even made to seem probable, that any of his wars had been begun by himself personally. David was no greedy robber, no vulgar swash-buckler.

Yet even all these heroic deeds are not the grandest trait of his character; what he achieved in the inner moral sphere is of infinitely greater importance. Above all his heart beat high in unison with the national soul of Israel. As a true Israelite he was a faithful servant and worshiper of Jahve, for whose sole glory and with whose trusting aid he wielded the sword. He wisely understood that a king of Israel must not only be a brave warrior, but that in the Israelitic state there also must be a place for Jahve. In conformity with this view David wished within the political centre of his kingdom to create also an ideal, religious centre. While Saul characteristically had allowed the Ark of the Covenant, the people's old-time halidom, to perish from oblivious neglect, David's earliest concern was to fetch it back from the little village, where it remained forgotten, and bring it into the new political capital, where it would occupy a more worthy station; just as Gideon once had inaugurated his tribal dynasty by the erection of a sanctuary in his native city of Ophra. David himself never undertook any important action without first consulting Jahve through the priest.

The portrait of David is not wanting in human traits of the worse sort, and the books of Samuel with inexorable love of truth have not in the least wished to hide or mince the matter. Still, the fact remains that David stands forth as the most luminous figure and most gifted personality in the whole history of Israel, in greatness surpassed only by the prophet of Sinai, by Moses, "the man of God."

What David achieved for Israel cannot be rated too high. Israel as a people, as a political factor, as a concrete power in the world's history, as a nation in the highest sense, is exclusively the work of David; and, although the kingdom which he built up through the struggles and anxieties of a long and active life, soon collapsed; although Israel itself, even a few generations after his death, was again divided into two halves—still, the ideal unity long survived the division that had really taken place. The past grandeur of the Davidian Epoch still became the haunting dream of the future days of Israel; and it is not through a mere chance that the wistful longing, and even the

consolation of Israel, should reappear in the form of a returning ideal, David, who, in his own person, should combine all the virtues and excellencies of the historical David; without any of his foibles.

With David the people of Israel had, once for all time, reached the acme of its national existence; his like never appeared again. After David, the history of the people of Israel changes into a continuous tragedy, pointedly illustrating the words of the Apostle Paul, that the misfortune of Israel enriched the world. The pearl is a disease of the shell, and kills that which creates it. And thus, also, the costly legacy bequeathed by Israel to the world, gushed forth from a well of tears. The worldly grandeur of Israel collapsed stone by stone, inch by inch, into utter decay; but the smaller it might appear outwardly the greater it became inwardly. In the downfall of Israel Jahve triumphed; and on the ruins of Jerusalem, Jeremiah proclaimed the New Covenant.

Israel died as a political nation, but arose again as a religious sect, as a community of the pious, the God-fearing, who, alone, would be privileged, and able, from out of their midst, to send forth another son of David, according to the flesh, and, spiritually, the performer of the work of Moses; greater than David, greater even than Moses.

DREAMS AND VISIONS.*

BY FELIX L. OSWALD, M. D.

II.

THE converts of Darwinism know that many of their opponents are apt to waive their objections after becoming familiar with certain species of their dumb fellow-creatures, and, as it were, studying the stepping-stones by which evolution has advanced in the progress from reptile to man.

For similar reasons many of our dualistic friends would be likely to modify their theories of hypnotic visions if they could study the numerous transition-forms between ordinary sleep and the alleged preternatural phenomena of somnambulism and clairvoyance. The essential difference between dream-visions and the impression of waking experience is the direction of the mental process, which in waking transmits its conceptions from the external senses towards the brain,—in sleep from the cerebral centres towards the external senses. In vivid dreams that activity of the brain-organism may affect the senses in a way resembling the promptings of volition. In moments of danger persons fleeing from an assassin or from a pursuing wild beast will shriek out for help; and perhaps ninety-nine of a hundred sleepers are occasionally apt to betray by similar exclamations the impressive-

* Copyrighted under "Body and Mind; or, The Data of Moral Physiology." Part XXIV.

ness of a distressing night-vision. A considerable proportion of vivid dreamers carry on audible conversations. Some of them give utterance to abrupt phrases, suggestive of anger or fear, while others voice both their thoughts and the replies of an imaginary companion, and often seem to rehearse elaborate dramas of dream-life, interjecting their remarks with laughs or impatient epithets, and even changing the sound of their voice, to suit the rôle of the various *dramatis personæ*. Many sleep-talkers accompany their words by animated gestures. In the military hospital of Puebla, Mexico, we had a patient who in his dream-talks would often clench his fists, and still oftener clap his hands—not in token of applause, but, as it seemed, under the promptings of a desire to emphasize his disregarded demands. “*Andale*,” he would grunt out in his guttural Spanish—“hurry up,”—“give me that bag back right away—*andale, demonio!*” and then clutch at the empty air and finally clap his hands in a way that could be plainly heard on the outside of the building. He had also a trick of suddenly pushing out his fist as if in the act of repelling a troublesome aggressor, but rarely moved his feet; and it would, indeed, seem that only five or six of a hundred sleep-actors ever leave their beds, but content themselves with such interludes as they can enact with their hands and occasional movements of their neck-muscles, as in nodding or shaking their heads.

Somnambulism is not always accompanied by attempts at audible conversation, but its proximate motive seems generally to be either an unusually vivid dream or the after-effect of a train of thoughts which has occupied the mind of the dream-walker in his waking-hours. The results of the latter mode of causation include many phenomena which our hyper-physical friends are specially apt to attribute to the inspiration, or the direct agency, of visitors from other-worldly spheres; but it is a suggestive fact that the effect of very similar antecedents of our waking experience can often be traced in ordinary dreams, as when a mother receives a letter announcing the serious illness of her son and in the dreams of the next night visits the sick-bed of her absent child. Similar after-effects of disquieting thoughts occasionally prompt sleepers to enact their dreams, and as we have seen in the foregoing paper, the remarkable results of that hypnotic activity can be explained by the circumstance that in sleep the mind is more fully concentrated upon a single problem of which the solution, in waking hours, would be confused or biased by conventional prejudices, as well as by the impressions of the external senses. Hence the frequent experience that somnambulists will execute feats—both mental and physical—apparently beyond the scope of their ordinary faculties. Dream-walkers will leave their beds

and use an open window to reach a roof-top which in daytime they would hardly have ventured to ascend with the aid of a ladder, or walk safely along the edge of a precipice where dizziness would make the co-operation of the conscious sensorium a direct cause of danger. There is a story of two Scotch highlanders who happened to see a fish-hawk's nest in a crevice of a deep cliff overhanging a point of the sea-shore almost inaccessible on account of the violence of the breakers, and engaged in a dispute as to the possibility of reaching the nest from the top of the cliff. Their controversy finally led to a wager which the younger of the two friends proposed to settle on the next calm day, by clambering down the precipice with the aid of a common grappling hook. The incident had almost been forgotten, when one night Sandy saw his friend get out of bed and leave the room by sliding down a tree that could be reached from the top of a rustic balcony in front of the window. Wondering what his room-mate could be about, Sandy slipped down-stairs and peered about the yard and adjoining garden, but the night-walker had disappeared in the darkness. Early the next morning they found him on the front-porch of the house, where he had fallen asleep on an armful of sticks and reeds, which on closer inspection proved to be the nest of the fish-hawk. Near by lay a silken neckerchief, tied up in the form of a pouch, and containing two grayish-white eggs; but on awakening, the sleeper seemed wholly unable to account for his absence from the bedroom, though his scratched arms and shins attested the vicissitudes of his nocturnal adventure.

The propitious calmness of the night probably suggested the idea of the strange expedition; and there are several well-attested cases of dreamers recording the solutions of intricate mental problems, which some instinct or other seemed to warn them against trusting to the biased faculties of the waking mind or to the doubtful safekeeping of memory. “A distinguished British lawyer,” says Dr. Abercrombie (*Intellectual Powers*, p. 306), “had been consulted respecting a case of great importance and much difficulty, and he had been studying it with intense anxiety and attention. After several days had been occupied in this manner, he was observed by his wife to rise from his bed in the night and go to a writing desk which stood in the bedroom. He then sat down and wrote a long paper which he carefully put by in his desk, and returned to bed. The following morning he told his wife that he had a most interesting dream; that he had dreamt of delivering a clear and luminous opinion respecting a case which had exceedingly perplexed him; and that he would give anything to recover the train of thought which had passed before him in his dream. She then directed him to the writing-

desk, where he found the opinion clearly and fully written out; and this was afterwards found to be perfectly correct."

Another circumstance which proves the identity of the mental process in ordinary dreams and a state of somnambulism, is the tendency to *assimilate incidental sense-impressions* to the topics engrossing the dreaming mind. We dream of a battle, and the pounding of a knocker on our neighbor's door is at once interwoven with the fabric of our dream-visions and falls on the ear like the booming of a distant cannonade. The rattle of an opening window shutter becomes the clatter of galloping ammunition-wagons, the sound of booted feet, kicking off clods of snow, is metamorphosed into the plunging of a wounded horse, and the light of the neighbor's lantern (affecting the sleeper's retina through his closed eyelids) into the blaze of a musket, followed by a loud report—the slam of the closing door. No skill of a magic-lantern artist can exceed the ingenuity of a ghost-seer in projecting the phantoms of his cerebral organism upon the surface of external objects: A fitting shadow assumes the outlines of a human form and finally the unmistakable features of his departed friend; a faint mumble is recognized as the sound of a well-known voice, a spirit hand beckons from the darkness, and imagination supplies all the requisite details to complete the illusive all of the vision.

In disease such visions often pursue the patient even into a state of half-waking consciousness. "A young lady of my acquaintance," says Dr. W. B. Carpenter, "was affected with a long and trying illness, in which all the severest forms of hysterical disorder successively presented themselves. The state of somnambulism usually supervened in this case upon the waking state, instead of arising, as it more commonly does, out of the condition of ordinary sleep. In this condition her ideas were at first entirely fixed upon one subject, the death of her only brother, which had occurred some years previously. To this brother she had been very strongly attached; she had nursed him in his last illness, and it was perhaps the return of the anniversary of his death, about the time when the somnambulism first occurred, that gave to her thoughts that particular direction. She talked constantly of him, retraced all the circumstances of his illness and was unconscious of anything that was said to her which had not reference to this subject. On one occasion she mistook her sister's husband for her lost brother; imagined that he was come from heaven to visit her, and kept up a long conversation with him under this impression. This conversation was perfectly rational on her side, allowance being made for the fundamental error of her data. Thus she begged her supposed brother to pray with her; and on his repeating the

Lord's prayer, she interrupted him after the sentence "forgive us our tresspasses," with the remark: "But you need not pray thus; your sins are already forgiven." Although her eyes were open she recognized no one in this state, not even her own sister, who had not been at home at the time of her brother's last illness."

The author of "Intellectual Powers" mentions the even more suggestive case of an English officer whose dreams could be prompted or changed at will by words whispered into the sleeper's ears or objects brought into contact with his hands or lips, and who, by his actions, proved how completely his imagination supplied the details of the visions suggested by the scant data of such sense impressions: "At one time his mischievous friends conducted him through the whole progress of a quarrel which ended in a duel, and when the parties were supposed to be met, a pistol was put in his hand, which he fired and was awakened by the report. On another occasion they found him asleep on the top of a locker or bunk in the cabin, when they made him believe he had fallen overboard and exhorted him to save himself by swimming. They then told him that a shark was pursuing him, and urged him to dive for his life, which he did, with such force as to throw himself from the locker upon the cabin floor, by which he was much bruised, and, of course, awakened. After the landing of the army his friends found him one day asleep in his tent, and evidently much annoyed by the cannonading. They then made him believe that he was engaged when he showed an evident disposition to run away. Against this they remonstrated, but at the same time increased his fears, by imitating the groans of the wounded and the dying, and when he asked, as he often did, who was down, they named his particular friends. At last they told him that the man next to him had fallen, when he instantly sprang from his bed, rushed from the tent and was awakened by falling over the tent-ropes."

Dreams, as well as trance-actions, are, indeed, apt to reveal the true character of a person more readily than his ordinary conduct, and often more so than his waking thoughts. Those thoughts, even in reveries giving the freest rein to fancy, are constantly checked and biased by the day-dreamer's principles, circumstances, and notions of practical possibility, all of which are excluded from the purely inclination-guided caprices of his dream-life. Of course, those caprices cannot be accepted as a hint of the dreamer's actual intentions. They do not prognosticate the probability of what he would be apt to *do*. They merely indicate his inclination, and betray—often for the first time, even to his own mind, what he would *like* to do, in the absence of unpropitious circumstances. The influence of educational ethics, for instance, has no vote whatever in the councils of dreamland. "In dreams,"

says Miss Cobbe, "we commit acts for which we should weep tears of blood, if they were real, and yet never feel the slightest remorse. The familiar check of waking hours, 'I must not do it because it would be unjust or unkind,' never seems to arrest us in the satisfaction of our wayward fancies in sleep. A distinguished philanthropist, exercising for many years high judicial functions, continually commits forgery; and only regrets the act when he learns that he is to be hanged."

Disregard of circumstantial considerations, is, however, in dreams not limited to the moral aspect of our projects, and conceptions which in sleep excite our exultation with the consciousness of having solved a problem of vital importance, are on awakening dismissed with a sigh, as wholly inapplicable to the needs of practical life. We plan enterprises with the hoped-for assistance of friends whose funeral we attended a quarter of a century ago; we invoke the aid of gods whose very statues have lost their helping hands; the seed of our golden harvest is entrusted to a soil that has ceased to repay the trouble of tillage.

Such limitations of dream-conceptions are, however, sometimes compensated by their intensity; their very one-sidedness favors concentration, and the wholly abnormal clearness of dream-born recollections can be explained by the circumstance that the experience of former years has left on our memory traces of many things that cannot be defined in words, and cannot be conjured up by the word-circumscribed thoughts of our waking hours.

THE NEED OF AN ACADEMIC CHAIR FOR THE TEACHING OF EVOLUTION.

A SUGGESTION BY PROF. E. D. COPE.

WITH the permission of our distinguished contributor, Prof. E. D. Cope, of Philadelphia, we publish the following extract from a communication to Mr. E. C. Hegeler:

"There ought to be somewhere in America a chair, or an institution devoted to the teaching of evolution from the basis upwards. Commencing with the lowest forms of life and rising to the highest, there should be an exposition by lecture and museum of the genealogies of plants and animals to man, and a statement of the laws deducible from the facts. The evolution of mind should follow, in all its parts, terminating in the highest aspects of intellect, feeling, and will.

"Such a chair was created in Germany a few years ago. To me the correct knowledge of evolution involves that of every science and philosophy and of practical life."

CORRESPONDENCE.

MR. PENTECOST AND GEORGEISM.

To the Editor of THE OPEN COURT:—

THE Single-tax religion, which is to "solve the labor question" and "make Christianity possible," has grown very thin under the attenuating advocacy of Mr. Hugh O. Pentecost. With excusable vanity Mr. Pentecost exults because I paid him the tribute of saying that "If Mr. George left the key to his problem in the hands of any man, he left it in the hands of Mr. Pentecost." I did say that; but when I said it, I thought that Mr. Pentecost was a more inspired and more competent apostle than he is. I cheerfully withdraw the opinion, and apologize for having uttered it. I think now that Mr. George put that key into his own pocket, and carried it away with him to England. Mr. Pentecost still persists in whittling the doctrine down to the common-place exaction known as *ground-rent*, imposed and collected after the manner of Chicago in the case of the First National Bank, and after the manner of New York in the case of the city docks. How much has Christianity been made possible in New York by the application of the Henry George theory to the city docks?

I am aware that Mr. Pentecost has the advantage of me in this discussion because of his greater learning, and his more extensive acquaintance with the subject. He is candid enough to acknowledge this himself, and politely says, that Wheelbarrow "does not know what he is writing about." As to himself he frankly says: "There can be no doubt, then, that I know what I am talking about. If anyone knows what Georgeism is, I do." There is such a cheerful egotism in all this, that I will not disturb the complacency of Mr. Pentecost by any language of resentment. I will merely, in a religious way, sprinkle a few coals of fire, or a few drops of hot water on his head.

Mr. Pentecost accuses me of "lamentable ignorance," but I will bear the reproach with resignation if he will only be civil to himself, and continue to describe himself with becoming pride as an "intelligent single-taxer." His opportunities have been greater than mine, and I shall never be able to compete with him in the graces of controversy and the eloquence of slang. I will reason with him as well as I can, without wishing to "prance into the ring," to "jump on him," or to "pin him down." I will not call him a "wiggler," nor appeal from his "high jinks," whatever they may be. In those prize-ring dialectics, where he is so "intelligent," I must confess to "lamentable ignorance." That style of grammar and diction still further dilutes the doctrine which Mr. Pentecost, with sectarian conceit, absurdly entitles "Georgeism." The more tenderly Mr. Pentecost nurses it with strong language, the weaker it grows.

I once heard a three-thimble artist at Epsom races rebuke the by-standers for "wiggling" after the nimble pea instead of selecting, in a straightforward way, the thimble which concealed it. The reproach appeared to me to be unjust, because the wiggling eye-search for the pea was due to the wriggling of the pea itself, under the three thimbles manipulated by the artist. I am told that three-card monte has the same peculiarities, and that it is only by ingenious mental wriggling that the by-standers can track the Jack of Clubs, and "pin him down." Now there are three thimbles called, respectively, "single-tax," "ground-rent," and "land-confiscation." Under which of them is "Georgeism"? Mr. Pentecost, accomplished in what he elegantly calls "illustrative tricks," and "sleight-of-hand performances," lifts up the "ground-rent" thimble and exposes the pea for an instant, but when the by-stander bets his money on it and lifts the thimble, he finds that the pea has fled. It is then under the "single-tax" or the "confiscation" thimble. The man who can follow "Georgeism" in

its wriggling journey under the three thimbles, must be himself a "wriggler" equal in quickness to the man who moves the thimbles.

"Don't be a-frightened, ladies and gentlemen," said the pop-merchant at the picnic, as the liberated corks flew out of the bottles with a noise like the firing of artillery, "don't be a-frightened; it's only ginger beer." "Don't be a-frightened," says Mr. Pentecost, "it isn't confiscation; it's only ground-rent; that's all there is to Georgeism." There is a melancholy deception here, in which Mr. Pentecost is himself deceived. I think that land confiscation is "all there is to Georgeism." It is that, or it is nothing. In this meaning of "Georgeism" lies its popularity, for "appropriating" land by government gratifies the landless. It may be, as Mr. Pentecost says, that "Wheelbarrow does not understand the single-tax doctrine," but Mr. George understands it, and he says, that "Georgeism" proposes "to take for the use of the community the whole income arising from land, just as effectually as it could be taken by formally appropriating and letting out the land." I think that is confiscation. I have no patent on my opinion; I adopted it from Webster, who, in defining the word "confiscation" borrowed from Henry George the very language I have quoted above. In defiance of the obvious meaning of the words, Mr. Pentecost persists in saying that they express nothing but ground-rent.

Having tried to show wherein the scheme is confiscation, I will now try to show wherein it is *not* ground-rent. In doing this, it becomes necessary to "wriggle" around after the nimble pea in its tortuous windings among the intricate meanings of the word "tax" and "rent." These words are used interchangeably by "intelligent single-taxers," to confound the moral distinctions between "rent," which government has no right to exact, and "taxes," which government has the right to impose. A tax is never levied by government upon its own land; rent is never drawn by government from land not its own. Whatever income is received by government from its own land is rent, assessed by special contract between the government and the occupier of the land, as a tax never is. A tax does not rest upon any special contract between the government and the tax payer. Its rate and amount are fixed by the government alone, at its own will. Ground-rent is a compensation rendered to the owner of land by the occupier of it; and no person other than the owner has any right to exact ground-rent for the use of land. Before government can "make Christianity possible" in the United States by exacting ground-rent from land, it must first own the land.

Mr. Pentecost, rather heedlessly I think, asserts that the George doctrine is already applied by the city of New York to the city docks, and by the city of Chicago to the First National Bank of Chicago. As to the New York matter I am not informed, but I know something about the First National Bank of Chicago, and I can assure Mr. Pentecost that the illustration is a very unfortunate one for him. The city of Chicago gets ground-rent from the First National Bank because the city *owns the land* on which the bank building stands. This rent has been assessed by mutual agreement between the First National Bank and the city of Chicago. It is rent fixed by contract, and not a tax imposed by the one-sided will of the city. Time was when the city owned the bank lot, and the adjoining lot. It sold the adjoining lot, and therefore obtains no revenue from it except the proportion of taxes levied upon it in common with other lots of equal value under the revenue law. From the lot which the city owns it obtains ground-rent; from the other lot it obtains taxes. Before it can obtain ground-rent from both lots the city must own them both, and before it can own them both it must confiscate or buy that adjoining lot. Mr. Pentecost sneers at the danger of "eviction" under "Georgeism," and innocently remarks: "The fear of eviction was not before the eyes of the men who built the massive buildings in Chicago upon the city ground-rent plan." True enough! But why? Because they had a seventy years lease of the land. Does Mr. Pentecost

think that men will put up "massive buildings" without ample security of possession? Does he think that men would put up "massive buildings" if they supposed that "Georgeism" was among the possibilities of social or political change?

I do not know that Mr. Pentecost has ever been a school-teacher, but I suspect him, because he talks like the fretful school-master under whose neglect I finished my education. I had struggled up to the rule of three, and half way through it, when I came to an "example" which baffled me. I appealed for help to the teacher, but he scolded me, and said that I was ignorant, and stupid, and that my efforts were all nonsense. He helped me a little with his cane, but he did not show me how to do the sum, and so I graduated there and then right in the middle of the rule of three. My school days ended and my child-labor began. I am still wondering how to work that sum. I have long since forgiven my teacher for not showing me how to do it, because I found out afterwards that he did not know. His reproaches were intended to conceal his own incapacity. Mr. Pentecost talks exactly like my poor old schoolmaster when he rebukes me thus:

"When Wheelbarrow says that under the George system, 'the land itself and not the value of the land' would be sold by the sheriff to satisfy the claims of the tax-collector, he talks nonsense. *How can land which is taxed by the government up to its full rental value have any selling value?*"

The "nonsense" consists in taxing the land up to its full rental value; but before exposing that, I must compliment Mr. Pentecost on the dexterity with which he conjured the little pea from the "rent" thimble to the "tax" thimble. It is now "taxes" and not "ground-rent" that he talks about. "How can land," he asks, "which is taxed by the government up to its full rental value have any selling value?" In this conundrum the "intelligent single-taxer" displays at least a glimmer of genuine intelligence. It appears to me that such land has no more selling value than the bung-hole of a barrel; and the paradox presented by the question stultifies the whole theory of Henry George. Land which is taxed up to its full rental value is confiscated and smitten barren by the law. It is barren to the owner because blighted by taxes equal to its product. It is barren to the government, which has taxed it up to the confiscation point, for no man will buy it thus incumbered. When I pointed out that anomaly, the "intelligent single-taxers" told me that I did not know what I was talking about, and that they only meant the rental value of the land *independent of the improvements*. The pea wriggled away again.

The conundrum put by Mr. Pentecost presents the distinction between "rent" and "taxes." It is true that only the *value* of land is taxed, but although the taxation is of the abstract, the collection is of the substance. Government may tax the key-hole of a house, but the house will be liable for the tax. So, if the tax on the value of land is not paid, the land is answerable for the debt. If because of excessive taxation, or for other reasons, the land has no selling value, the government buys it, or "bids it in" for the amount of the taxes, and thus becomes the owner of the land, as the United States of America became owner of the Arlington estate at Washington. Not so with delinquent rent. In this case the owner of the land resumes possession of it in the last resource, and evicts the tenant for non-payment of the rent agreed upon. Rent is assessed by contract between two or more; taxes by the sovereign will of one.

I never said that "under the George system Tom Clark would be taxed \$8 or \$10 on his farm." I was merely quoting the opinions of some of my critics to that effect, and I was trying to show how erroneous their estimate must be, and that if all the public burdens be thrown upon land values, the share of Clark must be very much greater than that estimate. But what matter? The question of Clark's proportion is devoured by the larger theme, the proposition to "take for the use of the community" the *whole income* of his farm, and in this way deprive him of it altogether.

The amount of Clark's taxes is a trivial question in comparison with the proposal to confiscate his farm. WHEELBARROW.

POSITIVIST AND MONIST, NOT A COMTIST NOR SPENCERIAN.

To the Editor of THE OPEN COURT:—

YOUR correspondent, R. F. Smith (in THE OPEN COURT, No. 90), in "Comtists and Agnostics," fails to catch on to my article on The Universal Faith (in THE OPEN COURT, No. 87), and in a very readable way sadly misinterprets its drift and purpose. Therefore allow a few words of iteration and explanation.

Let me say for the hundredth time, as I did in that article, that I am neither a Comtist nor a Spencerian; that I swear in the words of no master, wear no collar, and only seek the True and the Good everywhere, and by every help I can. From that point of view who could fail to be interested in the fact of the general disagreement of the leaders of modern thought? Harrison thunders at Spencer, who returns the fire, and Prof. Huxley pours his broadsides into both of them, while the republican or anti-papacy and anti-Comtist Positivists get in a stray shot as best they can. Amid this mutually destructive war the Monists appear upon the field with an OPEN COURT, into which they invite all contentents, with a view of final adjustment of as many of their differences as possible upon the higher ground of a Scientific Universal Faith.

My article sought to show that Prof. Huxley, the very father of the Agnostics, had made a statement of "a religion" upon which it seemed all could unite; except the Comtists, who could not without dropping their singular, inhuman, unevolutionary, and unscientific papacy; and except the Spencerians, "Spencer & Co.," because they were anarchistic, metaphysical dualists, and not Positivists, Monists, nor true and consistent Agnostics. Spencer was called a "Philosophic Balaam," because of his inconsistency in appearing as the appropriator of the four corner-stones of the Universal Faith, which Comte had put into position as the foundation of that Faith, only to break them up and make them useless as such foundation. How thoroughly Spencer & Co. have done that, notwithstanding Mr. Smith's denial, is manifest enough, viz.:

a) *The relativity of knowledge*, Spencer has practically destroyed by laying emphasis upon an unknowable Absolute, as the one object of exclusive religious awe or worship. Comte was a consistent relativist and Agnostic, and put his emphasis, both philosophic and religious, also upon the knowable and the human.

b) *The classification of the sciences*, Spencer took out of its real objective order from the stars to man, and divided it into abstract, abstract-concrete, and concrete, which ends most impractically with astronomy and sociology in the same concrete division, with no world between them!

c) Spencer then, in "The Genesis of Science," attacks and continues the attack on the law of "the three states" and the five states of history, viz.: from Fetichism, Sabeanism, Polytheism, Monotheism, to Positivism, or Monism, as I proposed to call it. The general result is to make a *pot-pourri* of history, and of the whole process of deanthropomorphization.

d) Then our Balaam tackles Humanity as a conscious organism, and insists that it should be of the j-illy-fish variety, without head or tail, and ending in "Administrative Nihilism" for its activity, as Prof. Huxley has humorously pointed out in his article never to be read enough.

Mr. Smith says that Spencer is in favor of all these corner-stones; to which I said and say, Yes! but in such a way as to blast them out, and make them of no use as corner-stones of any Universal Faith. For this very reason Spencer & Co. are leading a modern reaction in the name of science in favor of superstition and brutality, which every true Monist, Agnostic, Scientist and Humanitarian should join with Prof. Huxley in arresting as far as possible. Under the disguise of the Unknowable and the lead of

Prof. Fiske, the twilight of the gods has a quasi-scientific sanction, which makes every theological vampire flap his wings with the hope that a new morning has come for him, and turn to his sucking again with delight. Thus the Spencerian idea of natural selection, and evolution, and of the "Coming Age," makes every human despot and oppressor exult that the fightiest is, after all, the fittest, and that might makes right; while the moral or human selection, which would give might to the right, is disowned as simply a sentimental weakness of philanthropic fools.

My article was thus a protest against both Comtism and Spencerism, in the hope that we might bring to view Monism as a higher and clearer reconciliatory ground upon which real scientific Humanitarians, Positivists, and Agnostics could find a common home, leaving Harrison and Spencer, the Comtists and the Unknowables, to fight out their differences below, as simply *Papacy vs. Anarchy*: both of which are equally abhorrent to me.

This much it was needful to say, because Mr. Smith's short letter will be read by many who will not read my article referred to, and who will obtain an impression just the reverse of what was intended. His letter is a clear case of false labeling, which is the opprobrium of popular philosophic discussion. Nothing is more unfair than this wholesale naming business. Call a man a "Comtist," or "Spencerian," and it is commonly taken for granted that the limitations of those great men go to any one who happens to be thus named as their follower. Against this habit of being disposed of by a label, wholly false in fact, I protest.

Yours Respectfully,

T. B. WAKEMAN.

New York, May 19, E. M. 289.

THE LOST MANUSCRIPT*

BY GUSTAV FREYTAG.

CHAPTER XXXV.—Continued.

The lackey laid the table. Whenever he offered Mr. Hummel a dish, the latter gave him a withering look, and did not endeavor to make his office easy to him. While the servant was removing the things, Mr. Hummel began:

"Now permit me to talk of our affairs, it will be along account; have you patience for it?"

The evening had set in, darkness lay over the dismal house, the storm came on, the windows rattled, and the rain poured down. Ilse sat as in a dream. In the midst of the stormy scenes of the past day and the uneasy expectation of a wild night, the comfortable prose of the Park Street rose before her, where, fearless and secure, she was at peace with herself and the world,—so far as the world was not vexatious. But she felt how beneficial this contrast was; she even forgot her own position, and listened with deep sympathy to the account of the father.

"I am speaking to a daughter," said Mr. Hummel, "who is going back to her father, and I tell her what I have said to no one else: how hard it is to bear my child's wish to leave me."

He spoke about the child whom they both loved, and it was pleasant intercourse between them. Thus several hours passed.

* Translation copyrighted.

The lackey came again, and asked respectfully whether Mrs. Werner had sent Gabriel away.

"He has gone upon a commission for me," grumbled Mr. Hummel, to the inquirer; "he is looking after some money matters with which I did not choose to burden your honesty. If any one inquires from the city for me, I must beg, Mrs. Werner, to request this man to say that I am at home."

He again looked at his watch.

"Four hours," he said. "If the horse was good, and Gabriel did not lose his way in the dark, we may expect him every moment. If he has not succeeded, you may still be without anxiety; I will still take you from this house."

The bell below rang, and the house door opened—Gabriel entered. There was a gleam of pleasure in his countenance.

"Promptly, at ten, the carriage will stop before the inn," he said, cautiously; "I have ridden hastily in advance."

Ilse jumped up. Again the terrors of the day and anxiety for the future passed through her mind.

"Sit still," admonished Mr. Hummel again; "violent moving about is suspicious. I will meanwhile hold council once more with Gabriel."

This council lasted a long time. At last Mr. Hummel came back, and said, very seriously:

"Now, Mrs. Werner, prepare yourself; we have a quarter of an hour's walk. Yield yourself quietly to our guidance; all has been carefully considered."

Mr. Hummel rang. Gabriel, who had returned to the spy on the ground floor, entered as usual, and took several keys and a screw-driver out of his pocket, and said, cautiously:

"The first week we were here I closed the small back staircase and secured the door with a large screw; the people do not know that I have the keys."

He went to one of the back rooms and opened the entrance to a secret staircase. Mr. Hummel glided after him.

"I wished to know how I was to let myself in again," he said, returning to Ilse. "When I have taken you away some one must be heard moving about here as your spirit, otherwise all the trouble would be lost. Gabriel will take you down the back staircase, while I go out at the front door and keep the lackey in conversation. I will meet you a short distance from the house among the bushes; Gabriel will bring you to me, and I will be sure to be there."

Ilse pressed his hand anxiously.

"I hope all will go well," said Mr. Hummel, cautiously. "Take care to have a cloak that will disguise you as much as possible."

Ilse flew to her writing-table and in haste wrote these words:

"Farewell, beloved; I am gone to my father."

Again sorrow overpowered her; she wrung her hands and wept. Mr. Hummel stood respectfully aside. At last he laid his hand on her shoulder: "The time is passing away."

Ilse jumped up, enclosed the note in an envelope, gave it to Gabriel, and quickly veiled herself.

"Now forward," admonished Mr. Hummel, "out of both doors. I go first. Good bye, Mrs. Werner," he called out, through the open door; "I hope you will rest well."

He stepped heavily down the stairs, the lackey was standing on the last step.

"Come here, young man," shouted Mr. Hummel, "I wish to have you stuffed after your death, and placed before the council house as a model for later generations of the love of truth. When I return you may depend upon it I shall again give myself the pleasure of expressing my high opinion of you; then I will reveal to the Professor the consummate meanness of your character. I have a great mind to make your worthlessness known in the daily paper in order that you may become a scare-crow to the world."

The servant listened with downcast eyes, and bowed mockingly.

"Good-night, courtling," said Mr. Hummel, going out and closing the door behind him.

Mr. Hummel walked with measured tread from the house, turning to the left side where a path entered a thicket; there he concealed himself. The rain poured, and the wind roared in the tops of the trees. Mr. Hummel looked cautiously about him when he entered the darkness of the spot where Gabriel and Prince Victor had once spoken to one another of the ghosts of the castle. There was a slight stir in the thicket, a tall figure approached him and seized his arm.

"Good," said Mr. Hummel, in a low tone; "go back quickly, Gabriel, and expect me in time. But we must seek out dark paths and avoid the lights; you must conceal your face under your veil when we come into the open."

Ilse took the arm of her landlord and walked along, covered by the great umbrella which Mr. Hummel held over her.

Behind the fugitives the tower clock struck ten, when the outline of the inn outside the gate was seen against the darkened heaven.

"We must not be too early nor too late," said Mr. Hummel, restraining the steps of his eager companion. At the same moment a carriage came slowly towards them out of the darkness. Ilse's arm trembled. "Be calm," begged Mr. Hummel; "see whether that is your friend."

"I recognize the horses," whispered Ilse, breathless. Mr. Hummel approached the coachman's covered seat, and asked, as a password, "From Toad?"

"Ville," answered a firm voice. The Crown Inspector sprang down to Ilse; there was a little movement in the carriage, the corner of the leather curtain was lifted, and a small hand was put out. Hummel seized and shook it. "An agreeable addition," he said. Without speaking a word, the Crown Inspector unbuttoned the leather curtain. "My dear friend," cried a trembling female voice from within. Ilse turned to Mr. Hummel; "not a word," he said; "a pleasant journey to you." Ilse was pushed in; Mrs. Rollmaus seized hold of her arm, and held it firmly; and while the Crown Inspector was again buttoning the curtain, Mr. Hummel greeted him. "It gives me great pleasure," he said, "but for an exchange of cards this is not a favorable opportunity. Besides which, our classes, according to natural history, are not the same. But punctuality at the right time and goodwill were mutual." The Crown Inspector jumped upon the coachman's box and seized the reins. He turned the carriage, Mr. Hummel gave a farewell tap upon the wet leather curtain, the horses trotted off quietly, and the carriage passed into the darkness.

Hummel looked after it till the heavy rain concealed it from his view, cast one more searching glance down the now empty road, and hastened back to the city. He went to the Pavilion through the most remote part of the grounds; at the spot where Gabriel had put the lady under his charge, he dived into the deep shade of the trees, and made his way cautiously through the wet bushes to the back of the house. He felt along the wall. "Stop on the threshold," whispered Gabriel; "I will take off your boots."

"Cannot I be spared this court toilet?" grumbled Hummel. "Stocking-feet are contrary to my nature."

"All will have been in vain if you are heard on the staircase."

Hummel slipped up the stairs behind Gabriel into the dark room. "Here are Mrs. Werner's rooms. You must move backwards and forwards in the dark, and sometimes move the chairs, till I call you. There is now another spy, they are talking together below. I fear they suspect that we have something on hand. They look at me askance. The lackey every day carries the lamps from the sitting-room, and nothing must be altered; it would create suspicion if he did not hear some one moving about in the next room. When all is quiet, then the lackey leaves the house, and we can speak to one another."

"It is against my conscience, Gabriel," murmured Hummel, to remain in a strange house without the permission of the owner or lodger."

"Quiet," warned Gabriel, anxiously; "I hear the man on the stairs; close the door behind me."

Mr. Hummel stood alone in the dark. He placed his boots near the arm-chair, walked around them, and

sometimes gave them a push. "Very gently always," he thought, "for they are the movements of a Professor's wife. The demands which now-a-days are made on a householder exceed all imagination. An elopement from the house of a stranger, and acting the part of a lady in the darkness of night." The steps of men were heard outside, and he again pushed his boots. "Darkness in a strange house is by no means desirable," he continued, to himself. "I have always had a hatred of a dark room since I once fell down into a cellar; this gloom is only good for cats and rogues. But the most lamentable thing for a citizen is, that his boots should be withheld from him." He heard a light tread in the next room, and again moved the chair.

At last all became quiet in the house. Mr. Hummel threw himself back in the chair, and looked wearily around the strange room. A pale ray of light fell from without through a crevice of the curtains, and the tassel of the curtain and the gilded top of a chair glimmered in the darkness. Now at last Mr. Hummel might put on his boots, and then for a time he occupied himself with severe comments upon the world. His usual hour for rest had meanwhile come, and he was tired from his journey; he sank gradually into a dreamy state, and his last distinct thought was, "there must be no snoring in this princely darkness." With this intention he closed his eyes, and said farewell to the cares of the world.

In his sleep it appeared to him as if he heard a slight noise; he opened his eyes and looked about the room. He saw indistinctly that the wall looked different from what it had done. The large mirror that before stood there, seemed to have vanished, and it appeared to him as if a veiled figure stood in its place and moved. He was a courageous man, but his limbs now trembled with terror. He barricaded himself behind a chair. "Is this a magic lantern?" he began, with stammering voice; "if so, I beg you not to disturb yourself; I admire your skill, but have not my purse with me. But if you are a man, I should like a more distinct knowledge of the fact. I call upon you to show yourself in substance. I have the honor of introducing myself to you in this scanty light. Hat-manufacturer, Henry Hummel; my papers are correct—a passport to Paris." He put his hand into his breast pocket. "As a respectable citizen is bound to defend himself in these dangerous times, it has been inserted in my passport, *avec un pistolet*. I beg you kindly to bear this in mind." He took out a pocket pistol and held it before him. He again looked at the spot; nothing was to be seen; the mirror stood as before. He rubbed his eyes. "Stupid stuff," he said; "it was, after all, only a sleepy fancy."

(To be continued.)

COSMOS.

BY JOHN BEVERLY ROBINSON

In thought I floated in the abyss of space ;
 Earth out of sight ; sun indistinguishable ;
 Darkness about me ; but, before my face,—
 Above,—beneath,—a brilliancy afar
 Of mighty galaxies together throbbing ;
 And with me, from some other tiny star,
 A being whom my sight could not discern ;
 Whose voice I could not hear nor substance feel ;
 As thought answers to thought it spoke in turu :
 " Greater than thine, thou ' roof and crown of things, "
 My nature is ; and others greater still
 Inhabit atoms of these nebulous rings.
 But not the mightiest of them all can frame
 For the unbounded IS a worthy name."

BOOK REVIEWS.

MONUMENT FUNERAIRE A COURT SAINT ETIENNE. *Adolphe Samyn.*
 Liège : Ch. Claesen.

The form of this work is large quarto, beautifully illustrated ; it is an essay by M. Adolphe Samyn, a Belgian architect, descriptive of a monument recently erected in the cemetery of Saint Etienne. The idea of the structure is best expressed by the sub-title of M. Samyn's monograph ; namely, the application to funereal architecture of comparative religious symbolism. The dominant principles of the main religious creeds of ancient and modern times—principles all of which the originator of the project regarded as essentially true—have been represented by signs, emblems, and descriptions. The style of architecture is, in main, Hindu—the style best adapted to the requirements of symbolic art. The appearance of the structure recalls to mind the tombs of ancient India ; resembling a kiosk of small dimensions. The inscriptions and symbols are borrowed from India and Jerusalem, Athens and Rome, Gaul and Germania, Arabia and Persia, Egypt and Assyria. The conception is elaborate and original.

THE RUINS REVISITED, AND THE WORLD-STORY RETOLD. S. F. Walker. Lamone, Ia. : 1887.

This is an incoherent mass, a *pot-pourri* of geological, archaeological, ethnological, and biblical scraps. It is without a single statement of purpose ; it has neither unity nor plan. So far as we have been able to penetrate, we have not, with the exception of citations from other authors, found a single connecting thought between any two consecutive sentences. μκρκ.

"The Proceedings of the Thirty-Sixth Annual Meeting of the State Historical Society of Wisconsin," show a widening field of usefulness for that organization. Additions have been made to their library, and manuscripts of local historical import obtained. It is claimed that no public exhibition hall in Wisconsin is annually inspected by so many visitors as the Art Gallery of the Historical Society. The annual address, by Mr. Frederick J. Turner, discussed the Character and Influence of the Fur Trade of Wisconsin.

The Democrat, a London monthly, is an active and intelligent advocate of social and national reform. The reports of Mr. Henry George's English tour occupy much space in its columns.

La Chronique Moderne, a new monthly publication, is an entertaining and attractive review of current literature and art. Editor, M. Robert Bernier. Publisher, Paul Sevin, 8 Boulevard des Italiens. It has many novel features, prints only unpublished romances and poems, and offers valuable notes of Parisian artistic life

NOTES.

Miss Marie A. Brown will lecture before the Society for Ethical Culture, early in June, on the Norse Discovery.

The Sitaharanam, of which this week's chapter does not appear, will be continued in our next issue.

Brentano's will issue simultaneously in London and New York the *Romance of an Alter Ego*, a new novel by General Lloyd Bryce.

The Proverbs of Solomon have been translated into Volapük. We have received from the translator, Mr. Samuel Huebsch, a copy of the work.

A feature of the June *Magazine of American History* likely to attract attention is the paper "Evolution of the Constitution," by William C. Bates.

An interesting essay on mental and bodily culture is Mr. Morrison I. Swift's pamphlet "The Physical Basis of Education." It inculcates many valuable lessons.

THE OPEN COURT will henceforth appear with uncut pages. This change of form, which we trust will meet the approval of our readers, has been made with a view to obtaining a larger margin in the bound volumes of the magazine.

"A Concept of the Universe," by Mr. E. W. McComas, of Fort Scott, Kansas, is a pamphlet of thirty-eight pages, offering a solution of the problem of existence. Its philosophy is highly speculative in character, and its science eclectic.

The Teachers' Outlook, the first number of which is at hand, realizes the high expectations we had entertained of it. Its columns are bright, and filled with instructive and entertaining matter. It is comprehensive in its reviews of current affairs, careful in its choice of scientific and literary subjects, and able in its presentation of opinion. (W. G. Todd, Des Moines, Ia.)

The work of G. A. Hirn, "The Constitution of Celestial Space," (Gauthiers-Villars, Paris,) has evoked considerable comment in the scientific world. "It is beyond a doubt," said M. Faye, before the Academy of Sciences of the Institute of France, "one of the most original and interesting works produced in recent years." We may have occasion in a future number to present a brief review of Hirn's theories.

The first issue of *The Universal Republic*, "An Occasional Magazine Advocating the Unity of Nations," came out in January. The magazine is published in London, edited by Mr. George Jacob Holyoake (Eastern Lodge, Brighton). As the prospectus states, "it is not issued for purposes of profit, but to put into the minds of the European world the idea of the amity of nations." The object is a serious and noble one, and we hope *The Universal Republic* will find a wide circle of readers.

On May 15, the first number of *Dawn*, a monthly magazine devoted to the cause of Christian Socialism, appeared. The new periodical is published in Boston and edited by the Rev. W. D. P. Bliss. Dr. R. Heber Newton, of New York, Mr. Edward Bellamy, of Chicopee Falls, Mass., and Mr. Charles R. Fitch, of Denver, Col., are among the contributors. Its objects are "to show that the aim of Socialism is embraced in the aim of Christianity and that, in obedience to the doctrines of Christ, the Church must apply itself to the realization of the social principles of Christianity." Apparently the conversion of Christianity is to be made a 'condition precedent' to the establishment of Socialism ; certainly an indirect method to attain that which its projectors believe *per se* worthy of realization. In the "Declaration of Principles" we find much that is commendable and in the scheme of proposed legislative measures much to be endorsed. A valuable catalogue of works on Socialistic and Economic subjects is appended to the number.

Secular Thought

A Journal of Liberal Thought.

The Official Organ of the Canadian Secular Union.

\$2 a Year. Published Weekly. Single Copy, 5c.
CHARLES WATTS, EDITOR.

31 Adelaide Street East, Toronto, Ont., Canada.

Read what Colonel Ingersoll says:

"I am greatly pleased with 'Secular Thought'—with its form, arrangement, and contents—above all, with its spirit. It is splendid. I don't see how it could be better. I read it with the greatest of pleasure."
Col. ROBT. G. INGERSOLL.

Read what Helen H. Gardener says:

"Permit me to congratulate you on the fine appearance and tone of 'Secular Thought'! I heartily congratulate our Canadian friends upon the fact that they are represented by a paper of which they can be justly proud, and which they need never hesitate to hand to their most delicate-minded friends, however religious they may be."
HELEN H. GARDENER.

THE TEACHER'S OUTLOOK.

Published by The Teacher's Publishing Company, Des Moines, Iowa. A monthly magazine devoted to the interests of teachers and advanced pupils and intended to supplement the good work done by other school journals rather than to occupy the same field. Instead of filling its columns with school methods, school aids, and the details of school work, it will aim to interest the teachers in matters outside of the atmosphere of the school room, and its columns will furnish an OUTLOOK upon affairs of life, facts in science and nature which illustrate and test the theories of the schools. In this work it will hope to furnish the teacher with a natural source of inspiration and mental energy, quicken thought and make the school room a place joyous with buoyant spirits that offer a responsive greeting to the inquiring minds of youth, rather than heavy with that gloom and dullness which often surrounds the daily toil.

A leading feature of the magazine will be a monthly review of current events, civil and industrial problems, scientific inventions, discoveries, etc.

Another feature will be a very complete Review of current Literature, especially of all books and magazines coming within the sphere of its labor. We have entered into arrangements with all the leading publishers to keep us informed of all their new and prospective publications, and the Reviews will be made by competent critics.

Still another feature, and a very important one as giving a practical value to the OUTLOOK offered, will be the formation of a circle of writers out of its subscribers, from which it hopes to draw its corps of contributors. This plan is original as applied to a magazine, and is based on the idea of co-operation, or mutual helpfulness. If met with that appreciation necessary to its full execution it will be the means of introducing many new writers to the public, and of aiding many who now lack the training in the expression of thought necessary to a kindly reception in the field of literature into which their tastes would lead them. For further particulars send four cents for Prospectus, or fifty cents for magazine eight months. 112

Yearly Subscription, including postage, 1s.

WATTS' LITERARY GUIDE.

A Monthly Record of Liberal and Advanced Publications.

Invaluable to all who desire to keep abreast with the highest thought of the age.

THE

Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects

1. The Psychology of the Cell.—Introductory.
2. The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.
3. The Psychology of Nutrition: Holoptytic, Saprophytic, and Animal Nutrition; Predatory Habits of Certain Animalcula.
4. Colonies of Unicellular Organisms.
5. Fecondation of Proto-Organisms.
6. Fecondation of Higher Animals and Plants.
7. The Physiological Function of the Nucleus.
8. Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here they are translated, apart from the author's original investigations, the researches of Balbiani, Claparède and Lachmann, Maspas, Ribot, Haeckel, Engelmann, Espinas, Pouchet, Weber, Pfeffer, Kert, Dujardin, Gruber, Nussbaum, Bütschli, Lieberkühn.

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Dr. C. J. Romanes, that the first appearance of the various psychical and intellectual faculties is assignable to different stages in the scale of zoological development.

16 mo., 135 pages. Cloth, 75 Cts. Paper, 50 Cts.

OPEN COURT PUBLISHING COMPANY,

P. O. Drawer F., Chicago, Illinois.

TO ADVERTISERS!

For a check for \$200 you will print ten-line advertisement in 30 Million issues of leading American Newspapers and complete the work with ten lines. This is at the rate of one cent for each line a line, for 1,000 Circulation! The advertisement will appear in but a single issue of any paper, and consequently will be placed before One Million different newspaper purchasers; or FIVE MILLION READERS. If it is true, as is sometimes stated, that every newspaper is looked at by five persons on an average, ten lines will accommodate about 75 words. Address with copy of Adv. and check, or send 30 cents for Book of 250 pages.

GEO. F. ROWELL & CO., 108 Prince St., New York.

We have just issued a new edition of our Book called "Newspaper Advertising." It has 256 pages, and among its contents may be named the following Lists and Catalogues of Newspapers:—DAILY NEWSPAPERS IN NEW YORK CITY, with their Advertising Rates.

DAILY NEWSPAPERS IN CITIES HAVING more than 100,000 Population, with their Advertising Rates.

DAILY NEWSPAPERS IN CITIES HAVING more than 20,000 population, with their Advertising Rates.

A SMALL LIST OF NEWSPAPERS in which to advertise every section of the country; being a choice selection made up with great care, guided by long experience.

ONE NEWSPAPER IN A STATE. The best one for an advertiser to use if he will use but one.

BARGAINS IN ADVERTISING IN DAILY Newspapers in many principal cities and towns, a list which offers peculiar inducements to some advertisers.

LATEST CIRCULATIONS. A complete list of all American papers issuing regularly more than 25,000 copies.

THE BEST LIST OF LOCAL NEWSPAPERS, covering every town of over 5,000 population and every important country seat.

SELECT LIST OF LOCAL NEWSPAPERS, in which advertisements are inserted at half price.

572 VILLAGE NEWSPAPERS, in which advertisements are inserted for \$2. a line and appear in the whole lot—one half of all the American Weeklies.

Book sent to any advertiser for THIRTY CENTS.

150% PROFIT TO BOOK AGENTS. Order 30c. CHARLES H. REAR & CO., CHICAGO

Fundamental Problems.

The Method of Philosophy as a
Systematic Arrangement of
Knowledge.

By Dr. PAUL CARUS.

PRICE, ONE DOLLAR.

To Subscribers of THE OPEN COURT, 75 Cents.

*No Agnosticism but Positive Science,
No Mysticism but Clear Thought,
Neither Supernaturalism nor Materialism,
But a Unitary Conception of the World,
No Dogma but Religion,
No Creed but Faith.*

From the principle of positive philosophy indicated in the title, the author objects to Supernaturalism as well as Agnosticism. He proposes a unitary conception of the world on the basis of facts and discusses the most vital questions of philosophy and ethics; among them the problems of:—*Formal Thought (Kant's Apriori)—Causality—The Origin of Life—Absolute Existence—Space and Time—Infinitude and Eternity—Free Will—Ethics and Natural Science—The Importance of Art.*

DEFINITIONS EXPLANATORY OF THE POSITION OF
"THE OPEN COURT."

THE DATA of experience are perceptions.

REALITY is the sum total of all that is.

TRUTH is the conformity of cognition to reality.

[Truth being a relation between subject and object appears to be relative in its nature. Absolute truth is a self-contradiction; it would imply cognition without a cognizing subject.

At the same time it is obvious that absolute existence (in fact everything absolute) is impossible. Reality is properly called *Wirklichkeit* in German, derived from *wirken*, to take effect. Reality is not immovable and unchangeable absoluteness, but the effectiveness of things in their relations. Reality therefore implies not only existence, but the manifestation of existence also. Existence and its manifestation are not two different things; both are one.

The idea of something absolutely Unknowable is therefore also untenable; it would imply the existence of an object whose existence is not manifested *i. e.*, existence without reality; *Sein ohne Wirklichkeit*—which is a contradiction, an impossibility.]
SCIENCE is the search for truth.

The nature of science is the economy of thought. (*Mach.*)

Economy of thought is possible through application of the laws of form to thought.

KNOWLEDGE is the possession of certain truths.

[Knowledge is, so to say, the present stock or capital with which Science works. Science cannot exist without knowledge. The object of Science is not only to increase and enlarge knowledge but also to purify the present stock of knowledge from vagueness, errors, and misconceptions.

The purpose of knowledge is that of increasing our power over nature.]

MONISM is that philosophy which recognizes the oneness of All-existence, and the Religion of Monism teaches that the individual, as a part of the whole, has to conform to the cosmical laws of the All.

RELIGION is man's aspiration to be in harmony with the All.

[Religion has been defined differently in the columns of THE OPEN COURT, but all definitions that have been presented are in strict agreement. Mr. Hegeler in No. 25, defines Religion as "man's union with the All" (taking the definition from the Lutheran Catechism "Religion ist der Bund des Menschen mit Gott durch Gott," and replacing the Word God by the more comprehensive word THE ALL). The editor has defined Religion as "man's consciousness of his relation to the All" (No. 24); as "Das Allgefühl im Einzelnen," the All-feeling in the individual (see foot-note page 965); as "man's conception of the world that serves him as a guiding-star through life" (page 1180).]

MORALS are man's conduct in so far as it is in unison with the All.

[The basis of morality is religion. A moral educator or preacher may justly be asked, "On what authority dost thou jus-

tify thy precepts?" And he will tell us that his authority is not personal; he speaks in the name of universal order. Accordingly his authority is that of religion. If it were not so, all his good precepts would have no foundation; they would hover in the air like beautiful dreams that have no reality.]

ETHICS is the Science of Morals; it teaches man why he must, and how he can, regulate his conduct so as to be in unison with the All.

Natural history and the history of mankind prove that here on earth a constant progress takes place developing ever higher forms of existence.

Morally good are those acts which are in harmony with the All, *i. e.*, those which enhance progress, and *morally bad* are those which are not in harmony with the All, *i. e.*, those which retard or prevent progress.

[Religion (man's aspiration to be in unison with the All) has naturally produced many superstitious notions in the world, of its origin, and of its purpose. Similarly, science (man's search for truth) has produced many errors or false notions of reality. But all the superstitions of religion do not prove that religion as such is an illusion, and all the errors of science are no evidence that science as such is a sham.

It is obvious that religion and science, as here defined, are not contradictory to, but complementary of, each other. If religion and science do not agree, it is a certain sign that our conception of either the one or the other is wrong. The history of the human mind has been one of constant conflict and reconciliation between religion and science. Their relation has repeatedly been disturbed and re-adjusted.

The unitary conception of the world affords the only basis for the union of Religion and Science, and opens a new vista of progress for both.]

REVIEW OF RECENT WORK OF "THE OPEN COURT."

The work of THE OPEN COURT, for the past six issues, covers a wide range of subjects. In an article in No. 87, "The Universal Faith," Mr. T. B. WAKEMANN, of New York, discusses the foundations of a "monistic, positive, human, constructive religion." In the number preceding, an editorial essay points out and emphasizes the radical difference between religious Creeds and religious Faith. Then follow in Nos. 87, 88, and 89, respectively, the articles, "Agnosticism and Auguste Comte's Positivism," "Space and Time," "Formal Thought and Ethics," "Personality, Individuality, Consciousness," is the title of an essay (No. 87) by M. TH. RIBOT, the eminent French psychologist, translated with his consent from *Les Maladies de la Personnalité*. It contains the gist, one may say, of the principles from which modern psychology sets out. Dr. FELIX OSWALD contributes, in No. 88, a paper on "Dreams and Visions," an interesting study; and in No. 89, Mr. A. H. HEINEMANN writes effectively upon "The Preservation of Moral Purity in Children."

In criticism, appears the striking article from the French of ALFRED FOUILLEE, entitled "M. GUYAU'S Faith." The paper "The Transient and The Permanent in Theodore Parker" (No. 91), is Part I of a discourse held by Mr. MONCURE D. CONWAY at the dissolution of Mr. Parker's Society. Three articles (Nos. 90, 91, 92.) upon "The History of the People of Israel" are worthy of every reader's careful perusal. The author, Prof. CORNILL, is an orthodox theologian of Königsberg; his researches are marked by critical acumen, spirit, and above all a love of truth. A unique feature of the last few numbers is "The Sitabaranam," a translation from the Sanskrit, by Prof. ALBERT GUNZENSMAN.

In Economics, the controversy between "WHEELBARROW" and "SYMPATHIZER," Nos. 78, 85, 86, 88, occupies the first place. The subject is "Making Bread Dear." WHEELBARROW is well known to readers of THE OPEN COURT; SYMPATHIZER is a prominent Chicago citizen.

The Open Court.

THEODORE PARKER'S OPTIMISM.

A DISCOURSE AT THE DISSOLUTION OF HIS SOCIETY, FEB. 3, 1889.

BY MONCURE D. CONWAY.

II.

NO INDIVIDUAL may, indeed, briefly sift Theodore Parker; but the humblest individual may recognize the revision which every generation must give to its predecessor.

As an example of the transiency alluded to, Parker's concept of deity may be adduced. Nothing can be more perfect than his ideal,—of a deity supremely wise, loving, and at work in all the laws of the universe, present in all events minute or vast. But, as he himself complained, no Bible, no creed, affirms the existence of such a deity.

Whence, then, does Parker derive his belief in that existence? From his own heart,—from every humane heart, judged by what it really loves and worships,—he got his moral ideal of God. Only listening close at his own heart does man hear the beat of an eternal heart.

Could you at this moment approach some man or woman kneeling before deified Vengeance,—or say, some trembling maiden, fearing that her gay week is offensive to her jealous God; and invest that maiden with powers equal to those of her God; you should see how different her ideal deity from the one she kneels to. She would rise from her knees, glide out of the chapel, and, ere to-morrow's sun, every bedside of pain should know her special providence; pallid cheeks would bloom again, the lame would walk, the blind see, the dumb speak, and bereaved hearts again clasp their beloved. That is what each of us would do had we the power; and that is what the humble Christians around us believe God did do when he once visited the earth, where he purchased power to save others by taking their agonies on himself—even going to Hell for them. His miracles of benevolence and assurance of faith were incidental to his great mission, which was to ransom man from the dark and evil powers of nature. This ransom, however, since God left the earth, can only affect the ransomed after death. For Satan is still prince of this world,—conveyed to him by an angry moment's curse. God must stand by his hasty word of wrath till he can undo it

by an incarnate word of love. But the task is difficult. All that the tenderest mother would do for her child God would do for suffering humanity; but he cannot.

All this the humble Christian gets by revelation, founded on what he believes complete historical evidence. Whatever may be said of his science, his religious position is impregnable. He has a human God to love; not the author of man's evils but the martyr of man's ultimate deliverance from all evils; and the assurer, by miracles, by a bodily resurrection, of heavenly promises which sustain man under the afflictions of this Satanic world.

But now comes Parker to declare all this erroneous. The miracles are without evidence; the orthodox theory irrational; Satan is not the prince of this world, but God only. From the grass-blade to the galaxy, from the butterfly's summer day to the whole life of humanity, all is under the control of the all-wise, all-perfect, all-loving Father of the universe.

Having rejected supernatural revelation he had to find this perfect Being by revelation of nature. But nature has so many imperfections and evils, that Parker had to fall back on supernatural assumptions to support his natural theology. He assumed that whatever appeared evil was really good; that suffering was disciplinary, and would be compensated after death; and, as he could not respect a God less just than himself, he believed that even the animals would enjoy a happy future.

This theology was laid in faith, not in reason. A Roman Catholic may as firmly maintain papal infallibility despite all the papal crimes and massacres of history, claim that rack and thumb-screw were blessings in disguise, as much as the thousand cruel deaths of nature's infliction.

Early in Parker's ministry (1839-40) his faith was troubled by the gratuitous evils in nature,—such as the cat's torture of the mouse before devouring it.

"Were I," he then wrote, "to draw conclusions solely from organic nature, what attributes should I ascribe to the cause of the world? Certainly not just the same I now give Him. But looking into my consciousness, I find there a different idea of God; so the first witness is insufficient—the last perfectly competent."

But why is consciousness more competent to characterize the cause of things than the things themselves? Why may not our Catholic set his consciousness of

papal perfection against the imprisonment of Galileo, and ingenious cruelties of the inquisition? But here Parker's manuscript abruptly ends. That dialogue between reason and faith was never recorded.

The problem was insoluble; for no matter what good end is served by agony and villainy they can only be excused by the admission that the end could not be secured otherwise. And that limit on omnipotence is the tomb of theology. The problem was given up by Parker.

During the next twenty years his faith went on declaring everything for the best, his reason proving many things for the worst. Slavery, for instance, and intolerance, injustice to woman, and manifold wrongs whose providential benignity was too much disguised for his eye of faith.

"In this age," he said in one sermon, "poverty tends to barbarize men; it shuts them out from the educational influence of our time."

Parker repudiated the devils, but the devils of his time recognized him; as he passed they cried, "What have we to do with thee?" "Nothing whatever," answered Parker. "Hast thou come to destroy us?" "Precisely!" His theology never interfered to say—"Ah, you are God's agents: continue your disciplinary slave-hunt, your educational trampling of that outcast; God foresaw it all, it is under his providence, and all will be blissfully compensated in the end."

In early youth I walked with Theodore Parker in the woods near Framingham. I asked about miracles. He said, it is difficult to define what is, or would be, a miracle. One can deal more securely with particular narratives of events, and, if they be marvelous, weigh the evidence to find if it be proportionate to the doubtfulness of marvelous narratives. After a time he stretched himself on the ground with lips close to the grass, as if inhaling its life for his wan cheeks. Then he spake words which I tried to write down when I reached home. There is, he said, a certain miracle-sense in man which should be respected. We are too near the divine mystery of existence not to clutch at everything that seems to declare it. Men feed that mystic part of them with fables, as when, without bread, they will eat grass rather than starve. But when they shall have grown so far as to find God in that flower, to love him in that sky, to read his scripture in their own hearts, all Nature will appear miraculous.

So did I listen to the gospel of the grass, the 'vedas of the violet,' from that great heart, with unquestioning faith; and when presently we returned to the grove, where he addressed an antislavery assembly, the evils of the nation did not for me contradict his filial faith in nature. The yelp of the bloodhound was heard on the air; the sordid politician, the double-tongued

preacher, were portrayed, and not proved providential; but my optimism was undisturbed. Those vile phantasms would pass away, and there still would the green grass smile, and the violet, and their loving prophet.

But presently the prophet passed away; out of his beloved nature sprang an ugly cat,—so he called his consumption,—and fastened its claws in his side. And even while he was dying the voice of another interpreter of nature was heard,—that of Darwin. He was even more sweet and gentle than Parker, but represented a generation which walked by fact, not by faith. He proved that the evils we thought superficial and transient were inherent in the very organization of nature. It was not merely a cat torturing a mouse before eating it, or the invisible cat torturing Parker before consuming him; but the very principle of nature was predatory, the strong devouring the weak; the strata of the earth beneath our feet, the ruins of races, being successive cemeteries of populations tortured, slaughtered, burnt, buried, in the struggle for existence.

The optimism of Parker's theology might not pass away were it only a question of theology, or one of sentiment. The Darwinian theory might do away with it only in philosophical circles, were it only a theory. But society has been caught in an evolutionary revolution. The struggle for existence has compassed civilization. As huge saurians swam or stalked through primal swamps, so now pauperism, corruption, despair, crime, threaten to swamp civilization. These evils, wrongs, perils, have to be dealt with largely by religious enthusiasm, by existing organizations formed for human salvation. Among these there is now going on a survival of the fittest,—the standard of fitness being adequacy to the practical need of the times. The standard is not abstract truth; doctrines not true may sometimes serve in emergencies where truer ones would fail. Now, even were optimism theoretically true, it could hardly be turned to any practical aid in the salvation of men.

When Gouverneur Morris lost his leg a pious visitor showed him such moral advantages to accrue from the affliction that Morris begged him to send a surgeon to cut the other leg off too, so that he might be doubly blest. So will the suffering answer with tears and laughter those who would persuade them that diseases which massacre the innocents, drudgery that breaks men on its wheel, political and social corruption, are all the paternal providence of an immanent creator and father.

Already the naturalistic optimism of Emerson and Parker has been modified. We are now told by some that though whatever is, is not necessarily right, yet all is for the best,—in the long run. But there survives in this doctrine some of the old Calvinistic fatal-

ism, which proclaimed a universe working out divine decrees for both good and bad. Take away the bad decree, retain only the good, yet can you get for any cause the most strenuous service from the faith that its victory is a foregone conclusion? That man will work best who trusts to no dynamic stream of tendency making for righteousness, but feels success or failure dependent on his arm.

THE WORKINGMAN'S DOLLAR.

BY WHEELBARROW.

THE praiseworthy effort to prove that a pound of coffee weighing sixteen ounces, and a pound of coffee weighing fourteen ounces, can be made equal in value by Act of Congress is still going on. I am thankful to the finance teachers who have kindly taken me in hand, although I fear that I shall never be able to understand the "laws of money." I go down meekly to the foot of the class, and acknowledge myself the dullest pupil in the school. I cannot yet see that the silver dollars I get for my wages, each worth eighty cents, are just as valuable as gold dollars worth a hundred cents a piece, and I don't believe they are.

In a friendly criticism Mr. Albert of Kentucky gives me a lesson, and he tries with patient good temper to make the matter clear as mud, in this way: He says—"I would first advise 'Wheelbarrow,' the next time he gets hold of a greenback, to read it carefully. He will find the words 'on demand,' which are a distinctive feature of redeemable money, left out. Any lawyer will tell him that a promise to pay, without specified time of payment, is of no value." This leads me to suspect that Mr. Albert is a lawyer, which gives him a great advantage in the argument. It is very easy for him to refer me to a lawyer for information as to the legal obligation of promises to pay, but I cannot afford to get knowledge in that way. As it would cost me a week's wages and a dollar over to speak to a lawyer in Chicago, I went down to the public library and got a look at some law books on "Contracts," and they all said that a promise to pay without specified time for payment is a legal and moral obligation to pay the amount stated, of so much "value" that it will be enforced at law. This discourages me at the very start because it makes me doubt the wisdom of my teacher. If Mr. Albert's finance is as bad as his law, I fear that his instruction is of "no value."

Speaking of the greenbacks, Mr. Albert says: "For ten years the United States made no pretensions to exchange them for gold or silver, and yet they had a value varying from par to fifty per cent. discount. What gave them that value?" "Was it faith?" he says, "or the result of some natural law?" and he advises me at my leisure to "study out that conun-

drum." Well, I'll wrestle with it, and while I'm working it, will he tackle this one: What gave them the discount?

My first guess at the conundrum is this: Faith gave them value, and doubt gave them discount; just as they gave value and discount to the legal tenders of the Confederate States. The value and discount were regulated by the chances of their payment in gold, and the time of such payment. I was in several battles down South, and I noticed that whenever we got whipped the greenbacks got discount, and the graybacks got value, and *vice versa*. When Sherman took Atlanta the graybacks got so much discount that they have never had much value since.

The ancient assumption that a fish put into a vessel of water adds nothing to the weight of the whole, is adopted by Mr. Albert, and he coolly remarks: "As to the reason why the laborer's eighty cent silver dollar will buy as much as the boss's one dollar gold piece;" as if that fact were proved, when it is the main point in dispute. The reason, however, is pure magic; here it is: "All things have two values—the intrinsic value and the exchangeable value; money owes its value to both. The government can regulate the exchange value, it cannot affect the intrinsic value." That is to say, that money has a real, genuine value of itself, independent of the government, and a false value given it by Act of Congress. What Mr. Albert probably means is that government gives a *nominal* value to money, and that it circulates at that value within its own dominions. All this is but an evasion of the true question, which is: Ought governments to give a nominal value to money different from its real value, and thus cheat all men who work for wages? Government can give an exchangeable value to the yardstick, and decree that thirty inches shall be a yard, and it will be so, but government can never make ten yards of calico measured by the new yardstick equal in length or value to ten yards measured in the old way.

I am confident that Mr. Albert is in a whirl of confusion on the currency question, or he would not give us whole sentences utterly destitute of meaning, like this: "The government, by affording facilities to exchange silver, paper, nickel, and copper at par, or nearly so, it makes their exchangeable value equal to that of gold, after it has placed its stamp upon them." At par with what? "That pig," said the seller, "will weigh 200 pounds *on an average*." Does Mr. Albert mean silver, nickel, copper, paper, "at par" with one another, or with gold? And if either or both, at what standard? Ounce for ounce, or bulk for bulk? This obscure sentence is the most important in his article, because he bases all his argument upon it, quaintly remarking: "This explains why the silver dollar will buy as much as the gold one, and also why a grocer

can buy as much coffee in Brazil with the silver he receives in payment here."

There is a painful headache in all that inconsequent reasoning of Mr. Albert. That very miracle is just what the grocer cannot perform. He cannot buy coffee in Brazil and pay for it in silver dollars at par with gold dollars, for the obvious reason that gold dollars and silver dollars are not of equal value. In the market reports of the newspapers I find silver quoted like wheat, or oil, or pork. Nor can the government help the grocer to the value of a cent. It will not even try to help him, and Mr. Albert makes an inexcusable blunder when he says that the grocer "exchanges his paper or silver to the government, at a nominal discount to cover the transfer, and receives gold in return." He does nothing of the kind. The government will not give gold dollars for silver dollars. On the contrary, the government actually buys silver in the market, at the current price, whatever it is, then takes eighty cents worth of it, and stamps it, "One dollar: In God We Trust," and makes a clear profit of twenty-five per cent. This profit is a tax upon the wages of the workingman, who is compelled to take these dollars at their apocryphal or "exchangeable" value, instead of at their real value. "To increase the weight of the silver dollars," says Mr. Albert, would make them "heavier to carry about." That's true, but I'll try and stagger along under mine. As Mr. Albert is in error as to his facts, of course his arguments founded on them partake of their defects, and are valueless. If government can give an "exchangeable" value to silver dollars and make them equal to gold dollars, why will it not exchange one for the other? Why repudiate its own work, and dishonor its own coinage?

To be sure, I can go into a store and buy a dollar's worth of coffee, and the grocer will give me the same quantity, whether I pay him a gold, or silver, or paper dollar; but this apparent equality in value ought not to deceive anybody. It is evident that where payment can be made in different coins of the same denomination but of different metallic values, the merchant must fix the price of his goods on the presumption that he will be paid for them in the cheapest currency; if he gets the dearer coins occasionally, so much the better, but he cannot afford to count on them. During the war the prices of goods went up as the value of greenbacks went down. It could not be otherwise; and when I take my nine dollars, which I get as wages every Saturday night, and buy household comforts with it, I find fifteen or twenty per cent., and sometimes more than that added to the price of nearly everything I buy.

If the greenback is of "no value" because the words "on demand" are left out of its promise to pay, why does Mr. Albert contend that it is just as good as

gold? And if it is of "no value" for any reason, why should it be imposed on me as wages for my work? The value of any promise in morals, in business, or in politics depends entirely on the size of the chance that it will be redeemed. The value of a greenback dollar, or a silver dollar, or a brass dollar, depends on the chance that it will be redeemed in the dearest money current in its life time, and, at present, this is gold. If silver dollars worth eighty cents apiece, and gold dollars worth a hundred cents apiece appear just now to circulate at mercantile par with each other in ordinary transactions, it is because there is a working promise somewhere in the machinery of the government to pay the twenty cents. Where is it? Let us see.

Mr. Albert kindly advises me to read the greenback, and I shall find the words "On demand" left out. Will he "change works" with me and read the legend on the silver certificate, and he will find the words "on demand" left in; but it is very careful not to say, "dollars payable to bearer on demand," but *silver* dollars. On the reverse side of it, that invidious distinction is apologized for, and partly cured in the following agreement: "This certificate is receivable for customs, taxes, and all public dues." Here is the working promise to make up the difference in value between the silver dollar and the gold dollar. The promise appears to me to be reliable enough within the sphere of the sum total of the public revenues, and perhaps, a little beyond that sum; but it is a precarious reliance for the laboring man, because it is liable to be broken at any time by law or by war.

THE PHYSICAL BASES OF PERSONALITY.*

BY TH. RIBOT.

Translated from the French by γῶν.

I SHALL now dwell more at length upon the organic conditions of personality; inasmuch as everything depends upon these and they explain all the rest. Metaphysical psychology, with logical consistency, has paid no attention whatever to these conditions; for it derives its ego from above, and not from below. On the contrary, we shall maintain that the elements of personality must be sought for in the most elementary phenomena of life; the latter, in fact, stamp it with its own distinctive mark and character.

In every animal the basis of its psychic individuality is the organic sense—the sense of the body, usually vague and obscure, but at times very clear in all of us.†

This organic sense is that "principle of individu-

* Translation copyrighted.

† Incidentally, I may observe that a great metaphysician, Spinoza, plainly maintains the same thesis, although in different terms: "The object of the idea that constitutes the human soul is body...and nothing else." "The idea that constitutes the formal existence of the human soul is not simple, but composed of several ideas." (*Ethics*, part II. propositions 13 and 15. See also Scholia of prop. 17.)

ation" so eagerly sought for by scholastic doctors, for the reason that everything—either directly or indirectly—rests upon it. We may regard as highly probable, that according as we descend toward the lower animals this organic sense of body will more and more preponderate, down to the point where it actually becomes the entire psychic individuality. But, in man and with the higher animals, the turbulent world of desires, passions, perceptions, images, and ideas covers up this silent back-ground. Except at given intervals, it is forgotten, from the fact that it is not known. Here the same takes place as in the order of social facts. The millions of human beings, making up a large nation, as regards itself and others, are reduced to a few thousand men, who constitute its clear consciousness, and who represent its social activity in all its aspects, its politics, its industry, its commerce, and its intellectual culture. And yet these millions of unknown human beings,—limited as to manner and place of existence, quietly living and quietly passing away—make up all the rest; without them there would be nothing. They constitute that inexhaustible reservoir, from out of which, through a rapid or sudden selection, a few individuals rise to the surface; but these favorites of talent, power, or wealth themselves enjoy but an ephemeral existence. Degeneracy—always fatally inherent in that which rises—will again lower their race and themselves, while the silent work of the ignored millions will continue to produce other ones, and to impress upon them a distinctive character.

Metaphysical psychology only keeps in view the lofty heights; but purely internal observation cannot tell us much about what takes place within the body, and, as a matter of course, from the very outset, the study of general sensibility has been mainly the work of physiologists.

Henle (1840) defined general sensibility or "cœnæsthesis" as: "the *tonus* of the sensible nerves, or the perception of the state of average activity in which these nerves are constantly engaged, even during the moments when they are not excited by any external impression." And elsewhere: "General sensibility is the sum total, or the not yet unravelled chaos, of sensations that from every point of the body are being incessantly transmitted to the sensorium."* By the abovementioned term E. H. Weber even more precisely understands: an internal sensibility, an inward touch that imparts information to the sensorium concerning the mechanical and chemic-organic state of the skin, the mucous and serous membranes, the viscera, the muscles, and the articulated parts.

In France, Louis Peisse, a physician-philosopher, was the first to react against the doctrine of Jouffroy,

who maintained that we do not know our own body except in an objective manner, as an extended, solid mass, similar to other bodies in the universe, situated beyond the ego, and foreign to the perceiving subject. Peisse proved, though in somewhat cautious terms, that the knowledge of our body, above all, is entirely subjective. His description of this organic consciousness seems by far too correct, not to be quoted entire.

"Is it certain," he says, "that we have absolutely no consciousness of the activity of the organic functions? If it be the question of a clear, distinct, and locally determinable consciousness, like that of external impressions, it is clear that we lack it; but we might possibly possess a kind of silent consciousness, obscure, and latent, as it were, the analogue, for example, of that of sensations which provoke and accompany the respiratory movements—sensations, which, although incessantly repeated, pass by unperceived. In fact, might we not regard that remarkable feeling which ceaselessly and without intermission, warns us of the presence and actual existence of our own body, as a distant, faint, and confused echo of the universal vital activity? Almost always, and wrongly, we confuse this feeling with the accidental and local impressions that in waking hours arouse, stimulate, and maintain the play of sensibility. These sensations, though incessant, make but a fugitive and transient appearance on the stage of consciousness, while the feeling in question lasts and persists, even beneath this ever mobile theatrical display.

"Condillac very appropriately called it the basic feeling of existence; Maine de Biran termed it, the feeling of sensitive existence. Through this feeling, the body incessantly appears to the ego *as its own*, and through it the spiritual subject feels and perceives itself to exist, locally, as it were, within the limited extent of its organism. Like a constant, un-failing admonisher, it renders the state of the body incessantly present to consciousness, and thus, in the most intimate manner, displays the indissoluble bond subsisting between psychic and physiological life. In the usual state of equilibrium, which constitutes the state of perfect health, this feeling, as I said, is continuous, uniform, and is always equal, which prevents it from reaching the ego and attaining the state of distinct, special, and local sensation. In order to be distinctly remarked, it must acquire a certain intensity. This organic feeling is then expressed by a vague impression of well-being, or of general distemper; the former denoting a simple exaltation of vital physiological action; the latter its pathologic perversion. But in such case it does not fail to localize itself under the form of particular sensations, connected with some certain region of the body. It often reveals itself in a more indirect, yet far more evident, manner, when it

* Pathologische Untersuchungen, 1845, p. 114. Allgemeine Anatomie, 841, p. 728.

chances to fail in any given point of the organism; for example, in a limb struck by paralysis. Such a limb still naturally clings to the living aggregate, but it is no longer included in the sphere of the organic ego—if we may use this expression. The affected limb ceases to be perceived by the ego as *its own*, and the fact of this only negative separation, is expressed by a particular, positive sensation, known to all, who have experienced a complete numbness of any member caused by cold or a compression of the nerves. The sensation is nothing more than the expression of the break or loss which the universal feeling of physical life suffers; it proves that the vital state of the limb in question really existed, though obscurely felt, and that it constituted one of the partial elements of the general feeling of life of the organic whole. In this manner any continuous, monotonous noise—as that of a carriage in which we happen to be riding—ceases to be perceived, although continuing all the time to be heard; for if it suddenly stops, its cessation will be instantly remarked.

“This analogy helps us to understand the nature and mode of existence of the basic feeling of organic life, which in this hypothesis simply would be a resultant “*in confuso*” of the impressions produced upon the living points by the internal movement of the functions carried to the brain, whether directly by the cerebro-spinal nerves, or mediately by the nerves of the ganglionic system.”*

Since the time when this passage was published (1844) psychologists and physiologists have been at work studying the elements of this organic or general sense of the body. They have determined what each vital function contributes as its own share; they have shown how complex this confused feeling of life is, which, by means of incessant repetition has become ourselves; and that searching after it would be equivalent to seeking for ourselves. Consequently we know it only through the variations that raise it above, or lower it beneath the normal tone. The reader in various special works† will find the detailed study of these vital functions and their general physical contributions. It is not our purpose here to enter upon a special investigation of these topics, and therefore a condensed recapitulation will be sufficient.

In the first place, we have the organic sensations attached to respiration: the feeling of comfort produced by pure air; of suffocation from close air; those arising from the alimentary canal, and others, still more general, connected with the state of nutrition. Hunger and thirst, for example, despite appearances, have no precise localization; they simply result from a discom-

fort of the whole organism. They are the loud pleadings of a too impoverished blood. As regards thirst especially, the experiments of Cl. Bernard have shown that it arises from lack of water in the organism, and not from dryness of the pharynx. Of all the functions, general and local circulation exerts, perhaps, the greatest psychological influence, and its variations import the most from individual to individual, and according to the different moments, within the same individual.

Let us further recall to mind the organic sensations that arise from the state of the muscles: the feeling of fatigue, exhaustion, or its reverse; finally the group of muscular sensations which, associated to the external sensations of sight and touch, play such a prominent part in the creation of our knowledge. Even reduced to itself alone, in its purely subjective form, muscular sensibility will reveal the degree of contraction or relaxation of the muscles, the position of our limbs, etc.

If the reader will conceive for a moment the multitude and diversity of the vital actions just cited in a general way, he will be able to form a certain idea of what must be understood by the expression: physical bases of personality. Constantly active, they make up by their continuity for their weakness as psychic elements. Hence, as soon as the higher forms of mental life disappear, they pass to the front rank. A clear example of this exists in dreams (whether pleasant or painful) aroused by organic sensations; as night-mares, erotic dreams, etc. In these dreams, even with a certain degree of precision, we may assign to each organ the part that belongs to it; the sensation of weight seems mainly attached to the digestive and respiratory organs; the feeling of struggle and combat to affections of the heart. In more rare instances pathological sensations, unperceived during waking hours, will re-echo during sleep like premonitory symptoms. Armand de Villeneuve dreams that he is bitten in the leg by a dog; and a few days later that same leg is attacked by a cancerous ulcer. Gessner in his sleep fancies that he is bitten in the left side by a serpent; a little later on the very spot there developed an anthrax of which he died. Macario dreams that he has a very sore throat; he rises in normal health; but a few hours later is attacked by an intense amygdalitis. A man sees in a dream an epileptic; a short time afterwards he himself becomes one. A woman dreams that she speaks to a man who cannot reply to her, because he is dumb; at her waking she herself has lost the power of speech.

In all these cases we take for facts those obscure incitations which, from the depths of the organism, reach the nervous centres, and which, amid all its turmoil and perpetual mobility, conscious life hides from us instead of revealing.

It is clear that the exclusive faith which psychology

* Note to his edition of the “*Rapports du physique et du moral*,” by Cabanis p. 108, 109.

† See particularly Bain: *The Senses and Intelligence*. Part I. Ch. II. and Maudsley: *Pathology of the Spirit*.

has so long accorded the mere data of consciousness, would throw into the shade the organic elements of personality; but, on the contrary, in a professional way, physicians, as a matter of course, were expected to cling to it. The doctrine of the temperaments, old as medical science itself, ever criticized and ever remolded,* is only a vague and fleeting expression of the principal types of the physical personality, such as furnished by observation, and with the main psychical traits that flow hence.

The few psychologists, accordingly, who have studied the problem of the different types of character, have sought their ground of support in this doctrine. Kant did so more than a century ago. If the determination of the temperaments at any time could become scientific, the question of personality would be greatly simplified.

Until this takes place, the most relevant point will be, to rid ourselves of the purely preconceived notion, that personality is a mysterious attribute, dropped down from the skies, and without antecedents in nature. If we simply cast a glance at the animals that surround us, we shall have no difficulty in admitting, that the difference between horses and mules, between geese and ducks, their "principle of individuation," can only be derived from a difference of organization and of adaptation to environment, with the psychical consequences that thence result; and that in the same species the differences of one individual from another cannot originally be owing to any other cause. In the natural order of things there is no reason for making an exception of man; apart from the fact that in man the excessive development of intellectual and emotional faculties causes illusion, and hides the primitive origin.

Does physical personality exist in nature? Understanding by physical personality the mere sense of a state of organized being; a mode of being where, by supposition, all consciousness, whether clear or obscure, actual or reproduced by some external circumstance, would be absent?

Evidently not as regards the higher animals; physical personality, in the sense explained, can be posited only as a very artificial abstraction. It is probable, that this form of psychic individuality, consisting simply in the consciousness which the animal has of its own body, exists in very low species, yet not in the lowest.

* Henle has attempted recently (Anthropological Lectures, 1877, p. 103-130), to attach the temperaments to the different degrees of the activity, or *tonus*, of the sensitive and motor nerves. When this degree is at its lowest, we obtain the phlegmatic temperament. At a high degree, with a rapid exhaustion of nerves, we have the sanguine temperament. The choleric also supposes a high *tonus*, but with persistence in the nervous action. The melancholic temperament cannot be defined by the simple quantity of the nervous action; it supposes a high *tonus*, with the tendency to emotions rather than to voluntary activity.

In the latter,—*e. g.*, in multicellular individuals composed of cells entirely similar among themselves,—the constitution of the organism is to such a degree homogeneous, that each element lives apart by itself, and each cell has its own particular action and reaction. But their entirety no more represents an individual than six horses, drawing a carriage in the same direction, constitute one single horse. Here there is neither coördination nor consensus, but simply juxtaposition in space. If, with certain authors, we attribute to each cell the analogue of consciousness (which only would be the psychic expression of their irritability), we should obtain consciousness in a state of complete diffusion. From one element to the other there would exist a degree of impenetrability, that would leave the entire mass in the condition of living matter, without even an external unity.

In a higher order, however, for example in Hydras, observation is able to prove a certain consensus in the actions and reactions, and a certain division of work. Yet the individual is very precarious. Tremblingly, by aid of his scissors, out of a single individual was able to make fifty. Inversely, of any two Hydras we can make one; it is sufficient to reverse the smaller, before introducing it into the larger specimen, in a manner that the two endoderms touch and merge into each other. If allowed to venture an opinion on this obscure matter, I should say that this kind of adaptation of movements might denote a certain, temporary, unstable unity, subject to circumstances, yet perhaps, not entirely destitute of a certain obscure consciousness on the part of the organism.

If we find that we are still too low, we may ascend the series (for every determination of this kind is arbitrary), in order to fix the point at which the animal has only the consciousness of its organism, of what it undergoes and produces—or, has but one organic consciousness. This form of consciousness, in the pure state, perhaps, does not even exist; for, as soon as any rudiments of the special senses appear, the animal transcends the level of general sensibility. But, on the other hand, does general sensibility alone suffice to constitute a consciousness? It is known, that the human fœtus makes efforts to extricate itself from any inconvenient position, to escape the impression of cold or of painful irritation; yet, are all these merely unconscious reflexes?

I hasten away from all conjectures of this kind. One thing, at least, is incontestable; *viz.*, that organic consciousness—(the consciousness which the animal has of its body and only of its body)—in the greater part of animal existence exerts an enormous preponderance; that it stands in inverse ratio to the higher, psychic development; and that, everywhere and always, this consciousness of the organism is the

basis upon which all individuality rests. Through it all is; without it there is nothing. Indeed, it would be impossible to imagine the contrary; for, do not external impressions—that first matter of all mental life—enter through the organism, and—what is still more important—are not instincts, feelings, aptitudes, proper to each species, to each individual, stamped and fixed by heredity in the organism—we know not how, but as proved by facts—with an unalterable solidity?

THE SITAHARANAM; OR, THE RAPE OF SITA.

AN EPISODE FROM THE GREAT SANSKRIT EPIC "RAMAYANA."

TRANSLATED INTO ENGLISH BY PROF. ALBERT H. GUNLOGSEN.

II.

As SITA cast her eyes on the gold-shimmering stag with its pretty gold-lined flanks and golden antlers; its beautiful ears like lazur-stone; its golden skin with wonderfully delicate hair—the pretty woman at once broke into a gladsome smile.

At the sight of this golden-haired stag, with antlers like pearls and coral, purple-colored tongue, and entirely like the reflection of the star-bespangled firmament—the graceful Sita with a prolonged smile said to Rama: "Lo, behold that golden-colored stag, with a body reflecting all the hues of precious stones! Look, O descendant of Kakutstha,* how the wonderful creature seems to approach confidently toward us! If in this Dandaka-forest there are many golden stags like this, then, surely, O Rama, this forest must indeed be beloved of human beings. When I look at this singular golden stag, an ardent desire arises within my soul—the joyful thought of possessing and spreading on the ground its skin, which is bright like Jambunada†—the golden river—as a soft couch to rest upon. This may, perhaps, be an unfair desire and unwomanly; but my whole soul has violently been captured by the form of this pretty animal."

The distinguished hero Rama, listening to this speech of his beloved Sita, cheerfully remarked to his half brother, the son of Sumitra: "Behold, O Lakshmana, the heart of the beloved daughter of Videha is set on a stag! Then, still to-day this stag with its gorgeous skin must cease to breathe. Only, that you deal prudently with the princess, while I sally forth to fell this antelope with a single arrow of mine. O Lakshmana, I shall go forth and quickly kill this animal, in order to obtain its skin; but in the meantime you must

not stir from hence, until I return. Still to day Sita shall pride herself in the splendid skin of this stag, as once in the antelope-carpet of her seat in the city of Ayodhya."

Perplexed and falling into deep thoughts at the sight of this stag, that shone with all the splendor of a Taramriga,* Rama's half-brother, Lakshmana, answered:

"As had been foretold us by the holy seers, the Rishis—pure like the sacrificial fire—this stag, O hero, is only a deceitful Raksha, called Maritcha, who already has killed a great many kings, who in high spirits, mounted on chariots and armed with bows, went forth to hunt in the forest.

"At the sight of this lovely form, all ablaze with precious stones, O you wisest of men, you ought to consider what in reality it is. Bear well in mind, O man-tiger,† that this is only a golden phantom-stag, for what connection can there possibly exist between gold and a stag? This stag has neither antlers of coral, nor eyes of pearls; this, I should think, is only a phantom-stag, and none but a Raksha-demon in the disguise of a deer."

Thus Rama's brother spoke, but Sita, of the pure smile, whose mind had been like bewitched by the treacherous vision, began to remonstrate, and said:

"O husband, this delightful deer has entirely won my heart! O strong-armed hero, do you bring him, and he will be such a pleasant toy to play with. Here in the neighborhood there roam about many pretty stags, also buffaloes and other wild game, but, O Rama, I never saw a stag like unto this in splendor and amiable docility. If you catch him alive, the singular animal will be an object of wonder; and at the expiration of our exile in the wood, when returned to our royal abode, this deer shall be an ornament of our inner apartments. But, if you catch this unrivalled stag dead, its skin, O king, will always be precious, and upon which I should love to rest myself, yonder in the soft grass."

Thus Sita spoke, and the illustrious Raghuid listening, and likewise admiring the stag-like animal, became confused and said to Lakshmana:

"O son of Sumitra, whether this be a phantom-stag or not, at all hazards, urged by an ardent desire, still to-day I must overtake and kill it. There is not a like stag anywhere in the world—not even in Indra's paradise or in the gardens of Kuvera—the god of riches. His hair is smooth and bright, and he is confidently roaming about in the forest. When he opens his mouth, look at his tongue, like the points of a burning flame, from his mouth emitting a sort of blaz-

* Rama is frequently called Kakutstha—the descendant of Kakutstha; Ragbava—the descendant of Raghu; both names denote mythic kings. Sita and the Hindu wife generally addressed her own husband as Aryaputra—Aryason. Sita in the same manner is called Janakatmaja—the daughter of Janaka; Vaidehi—the daughter of the king of Videha, etc. In this paraphrase, in order not to bewilder the reader, I have avoided a too frequent repetition of these and other patronymics.

† Jambunada, the name of a mythic river.

* Taramriga, properly stag-star, here the name of a constellation—the λ Orionis, represented by an antelope-head.

† Naravyaghra, man-tiger, tiger among men, a distinguished hero, is a frequent epithet of Hindu-kings.

ing fire. Like unto molten gold, with feet like coral, with crescent-shaped flanks of a variegated silver hue, his whole body is indeed wonderfully beautiful, and sparkling like mother of pearl. Whose soul would not be allured by the vision of such an unrivalled deer? This remarkable animal has likewise entirely subdued myself. All kings, O Lakshmana, armed with bows, will ardently pursue a-hunting the animals of the forest, either for the sake of their flesh, or for mere sport. By the will of Shakra* have surely been created and allotted all gems that are found in the wilderness, all the various substances yielding pearls, precious stones and gold, all kinds of forest-timber, all wealth that is developed from seed and in a like manner the subjugation of this stag-like form must have been allotted to my share; and we certainly shall obtain wealth and gems worthy of a king. The graceful daughter of the king of Videha together with myself shall rest on the matchless golden skin of this deer. Neither cotton nor woven silk, neither the wool of sheep nor any costly tissue can match the softness of this animal. So at least I think. There exist only two incomparable stags—this auspicious animal, and that other divine one walking the paths of the heavens; this earthly one, and the constellation Taramriga. And if, as you tell me, O Lakshmana, he is that roaming phantom-stag, by whom powerful kings and princes, armed with bows, while hunting in the forest have been killed, in such case there is a yet stronger motive why I should destroy him.

“Once upon a time the evil Asura, † Vatapi, killed all the holy Brahmans he could, the which caused his belly to swell like a mule's. He for a long while also attempted to molest the holy hermit Agastya, but he was himself eaten by that high-souled penitent. While digesting him he arose, and with a smile spoke to Vatapi: ‘You, O Vatapi, in your turn have now gone down into a Brahman's belly; and since all arrogance must be punished, therefore be now ground to death by me; and if any one ever ventures to despise an observant Brahman, who like unto me has subdued his senses, he shall certainly share your fate!’ Therefore likewise this splendid deer, while thinking to overpower me, will itself find its death like that fiend at the hands of Agastya. Nay, I doubt not that I shall successfully overcome this royal stag. But you, O hero, mind well how in my absence you carefully protect my beloved Sita, and stir not hence until I return; for there are many Raksha-fiends abroad in the forest, bent on mischief.”

The glorious hero Rama repeatedly imparted these orders to his excellent brother Lakshmana, and begged him to dismiss all fear.

* Shakra, the name of god Indra as ruler of the eastern regions.

† The Asuras were the enemies of the gods.

TO MR. É. LITTRÉ.

BY LOUIS BELROSE, JR.

I LAUNCHED my bark upon a lonely sea,
 Though all I loved lay weeping on the shore,
 And set my sail for climes unknown to me,
 And bade my hopes farewell for evermore.
 No chart had marked the unfrequented way,
 And soon the giddy needle ceased to guide,
 While lowering clouds that darkened all the day
 Burst into storm and rent the surging tide.
 Black rocks that lurked like foes along the night
 Rose menacing, but still I struggled on,
 Till, lo, afar a friendly beacon-light
 Shone o'er the waste and led me to the dawn.
 A stranger hand had fed a saving fire—
 'Twas thine, O master! may it never tire.

PARIS, Sept. 16, 1873.

CORRESPONDENCE.

AN EXPLANATION BY MR. PENTECOST.

To the Editor of THE OPEN COURT:—

Referring to Wheelbarrow's last article allow me to say:

1. The so-called single-tax contemplates the so-called taxing of land up to its full rental value, irrespective of improvements.

2. The so-called single-tax is, therefore, ground-rent by another name.

3. Georgeism does involve the practical confiscation of land by the government. In form, it leaves the present owner of land an owner still; but, in fact, the government becomes the owner, and the relation between the land-user and the government will be just that between the city of Chicago and the First National Bank.

Does Wheelbarrow object to the confiscation of the land by the whole people to the exclusion of the private legal owners? If so he is at present in the majority, just as they were once in the majority who objected to the confiscation of the slaves from their legal owners. But when a majority of the people of this country come to see that the private ownership of land is a *crime against humanity*, as chattel slavery was a crime against the negroes then, the land will be confiscated just as the slaves were freed. It is simply a question of education. Now it seems to most persons that the legal owner of land is its *rightful* owner, and therefore he is allowed to keep it; but when it is perfectly clear to most persons that land is *rightfully* the common property of all, then no individual will be allowed to own any land to the exclusion and injury of others.

Wheelbarrow seems to think that if he can fix the charge of confiscation upon Georgeism he has dealt it a heavy blow. On the contrary, that is what we Georgetites glory in. We mean to utterly destroy the private ownership of land by confiscating *ground-rent*—by doing just what I said at the start: having *ground-rents*, and nothing else, paid into the public treasury, just as the First National Bank pays *ground-rent* into the Chicago treasury. But under Georgeism there would be no taxes of any kind to pay. *Ground-rent* would be all that any one would have to pay to government. The land would all be confiscated—taken away from the present owners without compensation, just as we now take a stolen horse away from a horse-thief or away from him to whom the horse-thief sold him. The government would be the real landlord to whom all *ground-rents* would be paid.

Is there any possibility of Wheelbarrow's failing to understand the thing this time? Why does not some one coax him to read “Progress and Poverty?”

HUGH O. PENTECOST

NEW YORK.

it was a considerate way of removing him from the person of the Sovereign. At the same hour every morning his carriage was to be seen standing before the wing of the castle which was occupied by the Princess. His personal relations to the young Princess appeared cool; in Court society he was treated by her with just as much distinction as was needful, and petitioners learnt sometimes that their requests were imparted to him. He was esteemed by the citizens on account of his benevolence, and was the only one of the lords of the Court concerning whom one never heard an unfavorable opinion. He dwelt in an old-fashioned house surrounded by gardens, was unmarried, rich, without relations, and lived quietly by himself. He was, it was supposed, without influence; he was not in favor, and was therefore treated by the young cavaliers with chivalrous condescension. He was, notwithstanding all this, indispensable to the Sovereign and the Court. He was the great dignitary who was necessary for all ceremonious affairs; he was counsellor in all family matters; he was ambassador and escort in all transactions with foreign powers. He was well known at most of the courts of Europe, had acquaintances in the great diplomatic bodies, and enjoyed the special favor of various rulers whose good will was of importance to the Sovereign; and as in our courts the reputation that one enjoys at foreign capitals is the standard of the judgment of the palace, the correspondence which he carried on with political leaders in foreign countries, and the abundance of broad ribbons of which he had the choice, gave him with the Sovereign himself an authority which was at the same time burdensome and valuable; he was the secret counsellor for the Court and the last resource in difficult questions.

The servant opened the door of the Princess's room with a profound bow to the old gentleman. Indifferent questions and answers were exchanged, the Princess entered the adjoining room and intimated to her faithful lady-in-waiting by a sign that she was to keep watch in front. When the conversation was secure from the ear of any listener, the demeanor of the Princess altered, she hastened up to the old gentleman, seized him by the hand, and looked inquiringly at his earnest countenance:

"Has anything happened? No trifle could have caused you to take the trouble of coming into this wilderness. What have you to say to your little daughter,—is it praise or blame?"

"I am but fulfilling my duty," replied the old lord, "if I make my appearance in order to take your Highness's commands, and to ascertain whether the residence of my gracious Princess is suitably arranged."

"Your Excellency has come to complain," exclaimed the Princess, drawing back, "for you have not one kind word for your little woman."

The High Steward bowed his white head in apology: "If I appear more serious than usual to your Highness, it is perhaps only the fancies of an old man which have intruded themselves at an unseasonable time. I beg permission to relieve myself of them by discussing them with your Highness. The health of the Sovereign is a cause of anxiety to us all: it reminds us of the transitory nature of life. Even the good humor of Prince Victor does not succeed in dissipating my troubled thoughts."

"How does my cousin?" asked the Princess.

"He overcomes the difficulties of being a Prince in a wonderful way," replied the High Steward; but he is sound to the core; he knows very well how to manage serious things cleverly. I rejoice," added the courtier, "that my gracious Princess feels warmly towards a cousin who is faithfully devoted to her Highness."

"He has always been true and kind to me," said the Princess, indifferently. "But now you have punished me severely enough. What you have to say to me confidentially must not be carried on in this way."

She took a chair, and pushed it into the middle of the room.

"Here, sit down, my worthy lord, and allow me to hold the hand of my friend when he tells me what makes him anxious on my account."

She fetched herself a low tabouret, held the right hand of the old lord between hers, looking earnestly into his eyes.

"Your Highness knows the way of giving me courage to make bold requests," said the courtier, laughing.

"That is more to the purpose," said the Princess, relieved; "I now hear the voice and hold the hand of him in whom I most love to trust."

"But I wish for your Highness a nearer and stronger support than myself," began the old lord, earnestly.

The Princess started.

"So it was that which occasioned your Excellency's journey?" she exclaimed, with agitation.

"That was the anxiety which occupied me. It is nothing—nothing more than an idea," said the High Steward, inclining his head.

"And is that to tranquilize me more?" asked the Princess. "What has hitherto given me the power to live but your Excellency's ideas?"

"When your Highness, while still in widow's weeds, was called home, the wish of the Sovereign, making it a duty to attend upon you, was welcome to me; because I thereby obtained the right of carrying on this conversation with your Highness."

He motioned with his hand to the seat, and the Princess again hastened to place herself by his side.

"Now when I see your Highness before me in the bright bloom of youth, richly gifted and fitted to con-

fer the greatest happiness on others and to partake of it yourself, I cannot forbear thinking that it is wrong for you to be debarred from the pleasures of home."

"I have enjoyed this happiness and have lost it," exclaimed the Princess. "Now I have accustomed myself to the thought of renouncing much. I seek for myself a compensation which even you will not consider unworthy."

"There is a difference between us of more than fifty years. A mode of life, proper for me, an unimportant man, may not be permitted the daughter of a princely house. I beg the permission of my beloved Princess," he continued, with a gentle voice, to draw aside to-day the curtain which has covered a dark image of your early youth. You were witness of the scene which separated the Sovereign from your illustrious mother."

"It is a dark recollection," whispered the Princess, looking up anxiously at the old lord; "my mother was reproaching the Sovereign,—it was something concerning the fateful Pavilion. The Sovereign got into a state of excitement that was fearful. I, then but a little girl, ran up and embraced the knees of my mother; he dragged me off, and—" the Princess covered her eyes. The old lord made a motion to stop her, and continued:

"The after-effect of the scene was ruinous to the life of a noble woman, and also to that of yourself. Then for the first time the diseased irritability which has since darkened the Sovereign's spirit displayed itself; from that day the Sovereign sees in you the living witness of his guilt and his disease. He has for years endeavored to wipe away from you that impression by kindness and attentions, but he has never believed himself to be successful. Shame, suspicion, and fear have continually ruined his relations with you. He will not let you go away from him, because he fears that in your confidence to another man you might betray what he would fain conceal from himself. He unwillingly gave in to the first marriage, and he will oppose a second, for he does not wish to see your Highness married again. But in the hours when dark clouds lie over his extraordinary spirit, he rejoices in the thought that your Highness might lose the right of secretly reproaching him. The thought that he did an injury to the princely dignity of his wife gnaws within him, and he is now occupied with the idea that your Highness might under certain circumstances forget your position as princess."

"He hopes in vain," exclaimed the Princess, excitedly. "Never will I allow myself to be degraded by an unworthy passion; it has not been without effect that I have been the child of your cares."

"What is unworthy of a princess?" asked the High Steward, reflectively. "That your Highness would

keep yourself free from the little passions which are excited in the quadrille of a masked ball there can be no doubt. But intellectual pastime with subjects of great interest might also disturb the life of a woman. Easily does the most refined intellectual enjoyment pass into extravagance. More than once has the greatest danger of a woman been when under powerful external excitement, she has felt herself to be higher, freer, nobler than her wont. It is difficult to listen to entrancing music and to preserve oneself from a warm interest in the artist who has produced it for us."

The Princess looked down.

"Supposing the case," continued the High Steward, "in which a diseased man, in bitter humor, should meditate and work for such an object, the sound person should guard himself from doing his will."

"But they should also not allow themselves to be disturbed in what they consider for the honor and advantage of their life?" cried the Princess, looking up at the old man.

"Certainly not," replied the latter, "if such benefits are in fact to be gained by the playful devotion of a woman to art or learning. It would be difficult for a princess to find satisfaction in this way. No one blames a woman of the people when she makes a great talent the vocation of her life; she may satisfy herself as singer or painter and please others, and the whole world will smile upon her. But if my gracious Princess should employ her rich musical talent in giving a public concert, why would men shrug their shoulders at it? Not because your Highness's talent is less than that of another artist, but because one expects other objects in your life; the nation forms very distinct ideal demands of its princes. If, unfortunately, the ruling princes of our time do not find it easy to answer to this ideal, yet to the ladies of these illustrious families the serious tendency of the present day makes this more possible than in my youth. A princess of our people ought to be the noble model of a good housewife,—nothing more and nothing else: true and right-minded, firmly attached to her husband, careful in her daily duties, warm hearted to the needy, kind and sympathizing to all who have the privilege of approaching her. If she has intellect, she must beware of wishing to shine; if she has a talent for business, she must guard herself from becoming an *intrigante*. Even the great social talent of virtuosity she must exercise with the greatest discretion. A well-weighed balance of female excellence is the best ornament of a princess; her highest honor, that she is better and more lovable than others, without parading it, with goodness and capacity in everything, and with no pretensions of any kind. For she stands too high to seek conquest and acquisition for herself."

(To be continued.)

“UNITY.”

With the first of March, '89, this paper has entered upon its eleventh year in an enlarged form, so that it can print each week a sermon representative of its message and mission, and at the same time it hopes by an addition to its present list of fifteen hundred new subscribers to reduce the price to a dollar, *i. e.*, to increase the capacity 25 per cent. and reduce the price 33½ per cent. UNITY is the organ of the National Unity Club Bureau, it has fostered and to a large extent shaped the Postoffice Mission work, it believes in and works for People's Churches and inclusive religion. It is suspicious of sectarian tendencies and dogmatic exclusiveness. It believes that religion should be friendly to science, and that it is indebted to its triumphs. It seeks to make religion a part of and essential to all human helpings. It would make Rationalism reverent and Reverence rational. It is in search of the unities of universal religion that reaches from the Catholic Church to the Ethical Culture Society, that includes the personal elements in Christendom, Judaism, and all other forms and names that have purified, sweetened, and ennobled life.

SPECIAL OFFER

To Readers of "The Open Court" only.

For \$1.50 we will send "UNITY" beginning with the number current on receipt of order and continuing to March 1, 1890, and will mail one each of the following pamphlets:

- Truths for the Times. By Francis E. Abbot.
- Natural Religion. By James M. Blake.
- The Present Heaven. By O. B. Frothingham.
- The Religion of Jesus. By H. M. Simmons.
- On the Vision of Heaven. By F. W. Newman.
- Is Romanism Real Christianity? By F. W. Newman and Francis E. Abbot.
- The Change of Front of the Universe. By M. J. Savage.
- Christian Propagandism. By Francis E. Abbot.
- Evolution in its Relations to Evangelical Religion. By B. F. Underwood and others.
- Compulsory Education. By Francis E. Abbot.
- Concerning Immortality. By Frances Power Cobbe, William M. Salter, Henry M. Simmons, Minot J. Savage, and others.
- An Address. By Ralph Waldo Emerson.
- UNITY, without the Pamphlets, \$1.00. Single Copies, 5 Cents.

"The Week, one of the ablest papers on the continent."—*Descriptive America.*

ENLARGED AND IMPROVED.

“THE WEEK,”
A Canadian Journal of Politics, Literature, Science, and Art.

Published every Friday. \$3.00 per year.
\$1.00 for Four Months.

THE WEEK has entered on its SIXTH year of publication, greatly enlarged and improved in every respect, rendering it still more worthy the cordial support of every one interested in the maintenance of a first-class literary journal.

The independence in politics and criticism which has characterized THE WEEK ever since its first issue will be rigidly maintained; and unceasing efforts will be made to improve its literary character and increase its attractiveness as a journal for the cultured home. Many new and able writers are now, or have promised to become, contributors to its columns, and the constant aim of the Publisher will be to make THE WEEK fully equal to the best literary journals in Britain and the United States.

As heretofore, PROF. GOLDWIN SMITH will, from time to time, contribute articles. London, Paris, Washington, and Montreal letters from accomplished correspondents will appear at regular intervals. Special Ottawa Letters will appear during the sessions of Parliament.

THE WEEK in its enlarged form will be the same size as "Harper's Weekly," and the largest paper of its class on the continent.

TO ADVERTISERS!

For a check for \$300 we will print ten-line advertisement in One Million issues of leading American Newspapers and complete the work within ten days. This is at the rate of only one-fifth of a cent a line, for 1,000 circulation! The advertisement will appear in but a single issue of any paper, and consequently will be placed before One billion different newspaper purchasers or FIVE MILLION READERS, if it is true, as is sometimes stated, that every newspaper is looked at by five persons on an average. Our lines will accommodate about 10 words. Address with copy of Adv. and check, or send \$30 for Book of 256 pages.
GEO. F. ROWE & CO., 107 SPRING ST., NEW YORK.

We have just issued a new edition of our Book called "Newspaper Advertising." It has 226 pages, and among its contents may be named the following Lists and Catalogues of Newspapers—DAILY NEWSPAPERS IN NEW YORK CITY, with their Advertising Rates.

DAILY NEWSPAPERS IN CITIES HAVING more than 100,000 population, omitting all but the best.
DAILY NEWSPAPERS IN CITIES HAVING more than 50,000 population, omitting all but the best.

A SMALL LIST OF NEWSPAPERS in which to advertise every section of the country, being a choice selection made up with great care, guided by long experience.

THE BEST PAPER IN A STATE. The best one for an advertiser to use if he will use but one.

BARGAINS IN ADVERTISING IN DAILY Newspapers in many principal cities and towns, a List which offers peculiar inducements to some advertisers.

LARGEST CIRCULATIONS. A complete list of all American papers issuing regularly more than 25,000 copies.

THE BEST LIST OF LOCAL NEWSPAPERS, covering every town of over 5,000 population and every important county seat.

SELECT LIST OF LOCAL NEWSPAPERS, in which advertisements are inserted at \$2.15 a line and appear in the whole lot—one half of all the American Weekly Book sent to any address for THIRTY CENTS.

MAKING BREAD DEAR.

A CONTROVERSY BETWEEN
WHEELBARROW and SYMPATHIZER
UPON

Corners and the Board of Trade

WITH REFERENCE TO
THE LABOR QUESTION.

PRICE, 10 CENTS.

THIS little pamphlet is a reprint from the columns of THE OPEN COURT of an able and spirited controversy between Wheelbarrow and a prominent Chicago financier. The title indicates the subject. Wheelbarrow attacks the combinations of trade that "make bread dear and laborers cheap." Sympathizer declares Wheelbarrow's article a misrepresentation of facts, and characterizes it as misleading and obscure. Wheelbarrow replies, explains more fully his position, and contends that the arguments of Sympathizer have only strengthened the stand he has taken. The discussion is by practical men, and forms an interesting chapter in economics.

Secular Thought

A Journal of Liberal Thought.

The Official Organ of the Canadian Secular Union.

\$2 a Year. Published Weekly. Single Copy, 5c.

CHARLES WATTS, EDITOR.

31 Adelaide Street East, Toronto, Ont., Canada.

Read what Colonel Ingersoll says:

"I am greatly pleased with 'Secular Thought'—with its form, arrangement, and contents—above all, with its spirit. It is splendid. I don't see how it could be better. I read it with the greatest of pleasure." Col. ROBT. G. INGERSOLL.

Read what Helen H. Gardner says:

"Permit me to congratulate you on the fine appearance and tone of 'Secular Thought.' I heartily congratulate our Canadian friends upon the fact that they are represented by a paper of which they can be justly proud, and which they need never hesitate to hand to their most delicate-minded friends, however religious they may be."

HELEN H. GARDNER.

"FAIR PLAY,"

in its issues of May 11th and May 18th, exposes the unfounded nature of the claim made by Christian prohibitionists that the Bible is favorable both to abstinence and prohibition. It is demonstrated that it is neither, hundreds of texts being cited by the compiler of

"BIBLE TEMPERANCE."

Labor, governmental, and financial questions discussed by able writers.

During the Summer a complete history will be given of the Walker and Harman "Autonomistic Marriage," together with a concise statement of the principals' present views upon the subject. Those who subscribe now will therefore receive the "official report" of this famous cause.

Seventy-five Cents per year.

Forty Cents per six months.

THE TEACHER'S OUTLOOK.

Published by The Teacher's Publishing Company, Des Moines, Iowa. A monthly magazine devoted to the interests of teachers and advanced pupils and intended to supplement the good work done by other school journals rather than to occupy the same field. Instead of filling its columns with school methods, school aids, and the details of school work, it will aim to interest the teachers in matters outside of the atmosphere of the school room, and its columns will furnish an Outlook upon affairs of life, facts in science and nature which illustrate and test the theories of the schools. In this work it will hope to furnish the teacher with a natural source of inspiration and mental energy, quicken thought and make the school room a place joyous with buoyant spirits that offer a responsive greeting to the inquiring minds of youth, which often surrounds the daily toil.

A leading feature of the magazine will be a monthly review of current events, civil and industrial problems, scientific inventions, discoveries, etc.

Another feature will be a very complete Review of current literature, especially of all books and magazines coming within the sphere of its labor. We have entered into arrangements with all the leading publishers to keep us informed of all their new and prospective publications, and the Reviews will be made by competent critics.

Still another feature, and a very important one as giving a practical value to the Outlook offered, will be the formation of a circle of writers, out of its subscribers, from which it hopes to draw its corps of contributors. This plan is original as applied to a magazine, and is based on the idea of the training in the expression of thought necessary to a kindly reception in the field of literature into which their tastes would lead them. For further particulars send four cents for Prospect, or fifty cents for magazine eight months. 112

Yearly Subscription, including postage, 1s.

WATT'S LITERARY GUIDE.

A Monthly Record of Liberal and Advanced Publications.

Invaluable to all who desire to keep abreast with the highest thought of the age.

—SPECIMEN COPY POST FREE.—

THE
Psychic Life of Micro-Organisms
A STUDY IN EXPERIMENTAL PSYCHOLOGY
By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects

1. *The Psychology of the Cell—Introductory.*
2. *The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.*
3. *The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition; Predatory Habits of Certain Animalcula.*
4. *Colonies of Unicellular Organisms.*
5. *Fecundation of Proto-Organisms.*
6. *Fecundation of Higher Animals and Plants.*
7. *The Physiological Function of the Nucleus.*
8. *Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.*

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instanced, apart from the author's original investigations, the researches of Balbiani, Claparède and Lachmann, Maupas, Ribot, Hæckel, Engelmann, Espinas, Pouchet, Weber, Pfeffer, Kuntz, Dujardin, Gruber, Nussbaum, Bütschli, Lieberkühn.

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Dr. C. F. Romanes, that the first appearance of the various psychic and intellectual faculties is assignable to different stages in the scale of zoological development.

10 mo, 135 pages. Cloth, 75 Cts., Paper, 50 Cts.

OPEN COURT PUBLISHING COMPANY,

DEFINITIONS EXPLANATORY OF THE POSITION OF
"THE OPEN COURT."

THE DATA of experience are perceptions.

REALITY is the sum total of all that is.

TRUTH is the conformity of cognition to reality.

[Truth being a relation between subject and object appears to be relative in its nature. Absolute truth is a self-contradiction; it would imply cognition without a cognizing subject.]

At the same time it is obvious that absolute existence (in fact everything absolute) is impossible. Reality is properly called *Wirklichkeit* in German, derived from *wirken*, to take effect. Reality is not immovable and unchangeable absoluteness, but the effectiveness of things in their relations. Reality therefore implies not only existence, but the manifestation of existence also. Existence and its manifestation are not two different things; both are one.

The idea of something absolutely Unknowable is therefore also untenable; it would imply the existence of an object whose existence is not manifested *i. e.*, existence without reality; *Sein ohne Wirklichkeit*—which is a contradiction, an impossibility.]
SCIENCE is the search for truth.

The nature of science is the economy of thought. (*Mach.*)

Economy of thought is possible through application of the laws of form to thought.

KNOWLEDGE is the possession of certain truths.

[Knowledge is, so to say, the present stock or capital with which Science works. Science cannot exist without knowledge. The object of Science is not only to increase and enlarge knowledge but also to purify the present stock of knowledge from vagueness, errors, and misconceptions.]

The purpose of knowledge is that of increasing our power over nature.]

MONISM is that philosophy which recognizes the oneness of All-existence, and the Religion of Monism teaches that the individual, as a part of the whole, has to conform to the cosmical laws of the All.

RELIGION is man's aspiration to be in harmony with the All.

[Religion has been defined differently in the columns of THE OPEN COURT, but all definitions that have been presented are in strict agreement. Mr. Hegeler in No. 25, defines Religion as "man's union with the All" (taking the definition from the Lutheran Catechism "Religion ist der Bund des Menschen mit Gott durch Gott," and replacing the Word God by the more comprehensive word THE ALL). The editor has defined Religion as "man's consciousness of his relation to the All" (No. 24); as "Das Allgefühl im Einzelnen," the All-feeling in the individual (see foot-note page 96); as "man's conception of the world that serves him as a guiding-star through life" (page 1180).]

MORALS are man's conduct in so far as it is in unison with the All.

[The basis of morality is religion. A moral educator or preacher may justly be asked, "On what authority dost thou jus-

tify thy precepts?" And he will tell us that his authority is not personal; he speaks in the name of universal order. Accordingly his authority is that of religion. If it were not so, all his good precepts would have no foundation; they would hover in the air like beautiful dreams that have no reality.]

ETHICS is the Science of Morals; it teaches man why he must, and how he can, regulate his conduct so as to be in unison with the All.

Natural history and the history of mankind prove that here on earth a constant progress takes place developing ever higher forms of existence.

Morally good are those acts which are in harmony with the All, *i. e.*, those which enhance progress, and *morally bad* are those which are not in harmony with the All, *i. e.*, those which retard or prevent progress.

[Religion (man's aspiration to be in unison with the All) has naturally produced many superstitious notions in the world, of its origin, and of its purpose. Similarly, science (man's search for truth) has produced many errors or false notions of reality. But all the superstitions of religion do not prove that religion as such is an illusion, and all the errors of science are no evidence that science as such is a sham.]

It is obvious that religion and science, as here defined, are not contradictory to, but complementary of, each other. If religion and science do not agree, it is a certain sign that our conception of either the one or the other is wrong. The history of the human mind has been one of constant conflict and reconciliation between religion and science. Their relation has repeatedly been disturbed and re-adjusted.]

The unitary conception of the world affords the only basis for the union of Religion and Science, and opens a new vista of progress for both.]

REVIEW OF RECENT WORK OF "THE OPEN COURT."

The work of THE OPEN COURT, for the past six issues, covers a wide range of subjects. In an article in No. 87, "The Universal Faith," Mr. T. B. WAKEMAN, of New York, discusses the foundations of a "monistic, positive, human, constructive religion." In the number preceding, an editorial essay points out and emphasizes the radical difference between religious Creeds and religious Faith. Then follow in Nos. 87, 88, and 89, respectively, the articles "Agnosticism and Auguste Comte's Positivism," "Space and Time," "Formal Thought and Ethics," "Personality, Individuality, Consciousness," is the title of an essay (No. 87) by M. TH. RIOT, the eminent French psychologist, translated with his consent from *Les Maladies de la Personnalité*. It contains the gist, one may say, of the principles from which modern psychology sets out. Dr. FELIX OSWALD contributes, in No. 88, a paper on "Dreams and Visions," an interesting study; and in No. 89, Mr. A. H. HEINEMANN writes effectively upon "The Preservation of Moral Purity in Children."

In criticism, appears the striking article from the French of ALFRED FOUILLEE, entitled "M. GUYAU'S Faith." The paper "The Transient and The Permanent in Theodore Parker" (No. 91), is Part I of a discourse held by Mr. MONCRE D. CONWAY at the dissolution of Mr. Parker's Society. Three articles (Nos. 90, 91, 92,) upon "The History of the People of Israel" are worthy of every reader's careful perusal. The author, Prof. CORNILL, is an orthodox theologian of Königsberg; his researches are marked by critical acumen, spirit, and above all a love of truth. A unique feature of the last few numbers is "The Sitabaranam," a translation from the Sanskrit, by Prof. ALBERT GUNLOGSEN.

In Economics, the controversy between "WHEELBARROW" and "SYMPATHIZER," Nos. 78, 85, 88, occupies the first place. The subject is "Making Bread Dear." WHEELBARROW is well known to readers of THE OPEN COURT; SYMPATHIZER is a prominent Chicago citizen.

OF CHRISTIANITY AND AGNOSTICISM.*

BY PAUL R. SHIPMAN.

YOUR true Proteus is that which certain philosophers call the Unknowable. What we speak of familiarly as the chain of causation is in fact an endless series of confirmations, of which the subject is presented as the vague sense of a force surviving all change, but which itself, as the vanishing point of knowledge, eludes comprehension. The real Proteus, no Menelaus, wind-bound and starving, or any other son of man, may seize, much less hold. Apart from its forms, it is known only as the boundary of consciousness.

With respect to this ultimate reality, of which the phenomenal universe is a manifestation, men take various attitudes, which, however, may be reduced to two. One of these is the attribute of knowledge, in greater or less degree, not merely of the existence of the force, which both affirm, but of the nature, designs, and supernatural methods. This attitude is common to all theological systems, of which in our era Christianity is the chief. The other attitude is one of cheerful but reverent submission to the limits of the human mind as marked by the adumbration of this force, with a disclaimer of all knowledge concerning what lies outside of those limits. This is Agnosticism, with which the last survivor of theological systems, should they come to that, will have still to reckon; and it is the intention of this brief paper to define the attitude of Agnosticism, as abstractly the radical and irreconcilable foe of theological systems of every kind, towards Christianity, as their representative in the current time.

In fulfilling this intention, it is proper, first, to state explicitly the distinction between Christianity and Agnosticism.

What, then, is the distinguishing mark of Christianity? Not religion; for religion, pure and simple,

* This article, it is proper to say, was prepared not only without reference to THE OPEN COURT, but without knowledge of it, which accounts for the absence of allusion to what has been said about Agnosticism in the editorial columns of this journal. Although now aware in a general way that THE OPEN COURT rejects Agnosticism under that name, I venture to let the article stand substantially as prepared, because, in the first place, it expresses my views, and, in the second place, the word *Agnosticism* is already popularized, and, above all, is significant of the point at which theology takes leave of science, and where, accordingly, it is the interest of science that the conflict between the two should centre; for, though religion and science are at one, theology and science are mutual foes, and can never lie down in peace together, unless, according to the familiar pleasantry, one lies inside of the other. Agnosticism, as I understand it, does not seem exposed to the reproach of dualism; if it is, the point of exposure, I think, may be easily guarded. P. R. S.

is the emotion excited by a consciousness of the ultimate reality, and, hence, belongs alike to Christian and Agnostic. Not morality; for the code of morals adopted by Christianity existed before Christ, and, in point of fact, was formulated by Agnostics themselves, who, at any rate, claim an equal share in it. There remains only the Christian system of theology, of which the pivotal point is the plan of redemption; and this, strictly speaking, is what distinguishes Christianity from Agnosticism.

Of the three distinct elements that make up Christianity in the familiar but superficial acceptation, two, religion and morality, are not peculiar to it, and, saying the least, no more Christian than Agnostic. The real characteristic of Christianity, the core and essence of it, is the scheme of theology which hinges on the doctrine of the atonement. This is its own; at all events Agnostics lay no claim to it. But this only is its own. Christianity, stripped of the borrowed elements that enrich and adorn it, is only this, and nothing more.

And this, it is needless to say, Agnosticism rejects; not primarily on account of rational objections to the scheme in itself, with which Agnosticism as such has no special concern, but on account of the fallacy of attributing any scheme to what we can know only as an indestructible force, whereof, consequently, nothing can be legitimately affirmed save indestructibility, and which, as transcending the intellect, is simply another name for the limit of knowledge, the affirmation of knowledge beyond which is a contradiction in terms. That what lies beyond the grasp of our knowing faculties we cannot know, is a self-evident proposition, if not, indeed, an identical one. And what we cannot know we cannot legitimately affirm.

On this ground Agnosticism stands; presenting towards the Christian theology, as towards theology in every other form, an attitude of calm antagonism, at once thorough-going and uncompromising. But the scene of this antagonism, so far as Agnosticism may determine it, is none other than the serene domain of reason.

In the domain of action, Agnosticism, having defined its tenet, and recorded its protest against all tenets contrary to it, turns aside from the arena of polemics, and goes about the peaceful business of in-

creasing knowledge within the province of the knowable, holding it neither necessary nor profitable to shoulder the musket of controversy, and mount guard on the frontier of the unknowable. That awful limit needs no sentinel to guard its inviolability; and, seeing that below in the field of knowledge the harvest is great but the laborers are few, those Utopian spirits that would harvest in the region beyond, fancying they can gather therein golden sheaves, may be wisely left to the consequences of their Utopianism; particularly as these, on the whole, form no unimportant factor in the development of man. And here emerges the consideration which controls the practical attitude of Agnosticism towards Christianity.

Institutions are the growth of experience, and, if they did not promise to serve pressing interests, would never arise, as they would quickly end, did they fail to redeem this promise; for men inevitably find out whether their pressing interests are served or thwarted, and, in the long run, regulate their action by the discovery. An institution rooted in the past, and flourishing in the present, therefore, must needs serve humanity, and, no matter how irrational in itself, shows an indefeasible title to the respect of men, not excepting those who may perceive its intrinsic absurdity. The history and status of such an institution not only vindicate its usefulness, but establish its right to exist until mankind has outgrown it, and a successor, more fit to serve the interests concerned as well as more in harmony with reason, is ready to supply the place of it; when it will crown its usefulness by passing away.

It follows that the true method of reforming or abolishing institutions is to assist mankind in outgrowing them, rather than directly to assail them, except of course in a way, and to a degree, that may quicken the growth which must eventually modify or supersede them. An institution, like any other agency, is best abolished by enabling the principal to do better without it; and this end is best promoted, not by trying to explode the institution, but by helping it to fulfill its mission.

Among the still thriving institutions that have come down from the past, Christianity unquestionably is one of the most august and beneficent; for, although it has no exclusive claim to morality or religion, and though its theology is visionary, it so combines the three as to make it, in the present phase of human development, an indispensable agency in guiding and refining men. The Christian theology, like every other theology, is a delusion, but the religion and morality associated with it are capital verities, which it serves to cherish and enforce, delusion though it is, as no truth can do, while men mistake the awe-inspiring fable for reality; since, by incorporating morals into its scheme of salvation, it puts upon its adherents, in form of

right conduct, the tremendous pressure compounded of the fear of eternal punishment and the hope of eternal happiness, which, manifestly, so long as it operates in full or even partial vigor, no mere force of reason can adequately replace.

The interests of society, accordingly, require that this pressure shall not decrease faster than the force of reason shall increase; so that the influence which is to supersede it in the end may continually supplement it before the end, and the sum of moral restraint undergo at no time any damaging diminution. It is this consideration to which I have referred as controlling the practical attitude of Agnosticism towards Christianity. In effect, as already seen, the attitude is one not of antagonism but of concert.

Theoretically, indeed, Agnosticism rejects Christianity, as essentially a system of theology, equally groundless with every other system of the kind; practically, nevertheless, Agnosticism acquiesces in Christianity, as a provisional engine of morality and religion, with which men cannot afford to dispense, as they surely will not dispense, until it is rendered unnecessary by a superior agency, which, however, can only be the slow outgrowth of the moral and intellectual advancement of the race, whereto, be it confessed, Christianity itself must continue indefinitely, what it has been from its rise, one of the main contributors. As regards the moral nature of man, in other words, the theological part of Christianity, wherein lies its distinguishing character, as I beg to repeat, may be likened to the shell of the chrysalis, which is essential to the development of the insect, but which, when the insect is developed, bursts asunder, freeing the perfect creature; whereas, removing the shell prematurely would leave the insect to die, in lieu of developing. The only salutary way of cutting short the term of the chrysalis is to speed the development of the insect.

And it is solely in the spirit of this method that Agnosticism would abridge the sway of theology: it would get rid of it by development, instead of destruction. In fine, Agnosticism, regarding Christianity as a stage in the moral evolution of man, is content to wait for man to pass out of it, expediting his passage not by decrying the station, but by reinforcing his strength, and directing his eyes to the goal that beckons him onward, emphasizing, to be sure, whenever and wherever needful, the pregnant implication that the station is not the goal.

It thus appears, if I may be allowed to use without offense a commercial figure, that of the great theological houses which in the process of time successively do business between man and the power represented as his maker, Agnosticism adopts the faith of none, but takes stock in each, being the silent partner of all.

It remains for me to express the hope, which I sincerely do, that Christianity, as the reigning house in this age, may have no good reason to feel ashamed of the connection. And I venture to add the hope that Agnosticism will prove not less fortunate. Be all this as it may, the partnership, whatever its fortunes, will continue until, if ever, the spread of enlightenment puts an end to the business, winding up, in the midst of heaven on earth, the last establishment.

THE TEACHINGS OF THEODORE PARKER.

A DISCOURSE AT THE DISSOLUTION OF HIS SOCIETY, FEB. 3, 1889.

BY MONCURE D. CONWAY..

III.

SIMPLE Theism is the recurrent clearing away of outlined symbols. It is always transitional. Mere theism has never been able to sway mankind as a finality. Men build no temples for abstract or causal gods; there is perhaps not one church in the world erected to any deity never seen in human form—no temple to Brahma, or Jehovah, or Allah, no church ever dedicated to Almighty God. Churches bear the names of human helpers, saints, saviours,—of Krishna, Buddha, Jesus, Mohammed, Luther, Wesley. Man is interested in man; theisms end in human incarnations.

Every religion begins with man adoring the universe and ends with the universe adoring man. And every special religious movement must run this course. Modern naturalism has run that course. All theology is now passing away before an enthusiasm of humanity which corresponds to what was called incarnation of God.

Speculations about divine personality will become attenuated like those about predestination, fore-knowledge, and the rest,—by desuetude. Men will be too much absorbed in human salvation to argue about abstractions. Jesus is becoming an archetype of all modern reformers.

The exalted and constructive theism of Theodore Parker paled his Christianity. To him Jesus was a great and good man who, not withstanding some limitations, taught the absolute religion—love to God and Man. Jesus Christ became his model man and teacher.

Unfortunately, the Jesus Christ of the New Testament is not a mere man: he is combination of a miraculous radical and a supernatural king. Parker objected to him as a king coming in clouds of glory to set his disciples on twelve thrones to rule over mankind, and as sending all who refused him worship into unquenchable fire. He did not see that Jesus as the poor man's champion was invested with popular superstition.

Jesus's denunciation of the rich and respectable as a generation of vipers, who cannot escape the dam-

nation of hell, his inculcation of poverty as a beatitude and duty, of a socialism non-resistant in its own brotherhood but armed against outside authority, are not the voice of an individual man but of wide-spread fanaticism exasperated by oppression.

The morality of Jesus is related to the miracles. The son of kings born in a stable, was evolved into a Son of God, but also into a divine Son of Man born of a peasant woman. In the legend two forces, the imperial and the plebeian, struggle, like Jacob and Esau in the womb; they have contended with alternate success through history; and this day the crowned Christ on his throne is confronted by the Son of Man with his revolution,—coming not to bring peace but a sword.

Theodore Parker's method was, I think, influenced by his realistic conception of a Jesus who was unreal. He individualized as a reformer an incarnation of popular superstitions and hatreds, as well as of aspirations. Some of Parker's preaching seems to belong to the militant age, in which we saw every man not for us as against us. But that method is passing away before the evolutionary age, which sees that every man is for us at heart, however his development may be arrested by circumstances.

We must abandon the notion that our opponents are hypocrites, or lovers of wrong, or time-servers, or blind leaders of the blind. We are all growing in the same rain and sunshine; the expanded flower must not misunderstand the bud's bitter taste, but shed on it fragrant pollen.

Otherwise the bud may misunderstand the flower, and not follow its expansion. Theodore Parker was gentle, affectionate, lowly; yet he was regarded by his opponents as bitter, sarcastic, arrogant; and even dear friends entreated him to be less severe. To one of these he answered:

"While I feel great tenderness towards the preconceived notions of *individuals*, when I am to speak of a mass of doctrines that come between man and God, I think the blow must be strong enough to cut clean through, and let the light stream through the rent."

To another:

"I say to you, what I never said before—not even to my wife—that after writing some of those sentences for which I am most commonly abused, I have been obliged to pause, then throw myself on a couch and get relief in tears. . . . He that reads my books twenty years hence—if I am not quite forgotten by that time—will not find in them the abuse, the sarcasm, the contumely, and all that, which so grieves you."

To this his appeal to the judgment of the future, you and I can this evening respond; and I believe the verdict must be that Parker was, indeed, tender to individuals. Yet, writing beneath the musket which another Captain Parker used at Lexington, he felt himself struggling in a revolution against great religious

and political oppressions. Therefore his words must be sometimes hard as bullets, though each tore his heart as it went forth. For it was the cause of God, of truth, of humanity, which his soul's honor dare not compromise.

It was the militant method. It was not logical in him; for if, as he affirmed, God was everywhere immanent, he must be at work in that same "mass of doctrines that come between Man and God." But this is the inevitable inconsistency of all who kneel to infinite perfection everywhere, then rise up to fight imperfection everywhere. It is the inconsistency which worships a father who sends his sunshine alike on just and unjust, but for the unjust has a practical "Depart, ye cursed!"

But the revolutionary method has been superseded by the evolutionary method. In the present stage of philosophy thinkers far inferior to Parker may discover in him survivals of the crusader, the Puritan, and in his doctrine unconscious remnants of dogmas he assailed. Even so the next generation will discover similar survivals in the most advanced minds of to day. For such are hereditary, and a man can rarely educate himself out of them. Therefore in estimating a teacher the main thing is what he added to his moral and intellectual heritage. And in the city of Boston which he helped to make the metropolis of culture and philanthropy, many witnesses remain to attest that, whatever may be the fate of some of his opinions, the personality of Theodore Parker, the human standard he erected, his moral elevation, his invincibility blended with humility, have made him a type of American character which shall never pass away. It will remain for honor when some of his speculations, and some which succeed them, shall alike be remembered only as religious fossils of the Nineteenth Century.

There will some day be centennials of spiritual independence, and of the union of religious colonies; and in that day every scrap of testimony concerning Theodore Parker will be searched for as now every scrap relating to Washington. He will be a far greater name then than now, for it will take a century to sum the results of his work.

One of your great "Athenians" told me that once, having conquered some prejudices, he went to the Music Hall to hear this setter forth of strange doctrines. What he heard was a notice that the great preacher was ill; and never again did Parker preach. Not the individual Parker,—not the transient orator. But last evening, as I listened to the orchestra in that hall, I saw that although the great organ, once set up with rejoicings, has been removed, the bronze Beethoven still stands; and though no work of his was named on the programme every strain had been touched by his spirit. And the Bostonians who went too late to

hear the great New England preacher are still listening to him. Only last Sunday I heard Parker preach in Boston. He bore the outward appearance of Phillips Brooks, but that great-hearted sermon had never been heard had not Parker lived.

Theodore Parker while he wrote on paper also wrote on hearts, and much that only experience could interpret and estimate. I do not apologize therefore for giving you a brief transcript of what Theodore Parker wrote on my own life.

In my early youth, in Virginia, Carlyle's famous pamphlet had just quieted all our misgivings about slavery, when Theodore Parker's voice was heard. A Richmond editor published the whole of his discourse on Daniel Webster, much to the horror of his subscribers; he published it, he told me, from admiration for the power and moral courage of it. That discourse was a revelation to me. I supposed till then that all learned men believed slavery a divine institution, especially preachers. I did not learn till later what a peculiar preacher Parker was. Carlyle's casuistries were cleared away from that time, but I never read another page of Parker for a year or two.

When from terrible trials, attending abandonment of my Methodist ministry, I came on to enter the Divinity School, I was still a minor in several senses,—as lonely and sad and crude an exile as ever came with his pittance to a great city. I asked for the cheapest hotel. In a little diary, unread for 35 years, I have just found some hasty entries.

"1853, Feb. 25. To Boston. On the way the cars ran into a train—and smash! Reached Boston about 6. Put up at the Marlboro House; a very orderly, pleasant, and orthodox place. They have prayers morning and night, at which a piano with Æolian addition is used. After prayers there is singing till bed-time.

26th. I was introduced to many fine men and preachers. Dr. Young carried me about to look at various places. It was with a thrill I cannot describe that I saw the Cradle of Liberty.

27th. Went to hear Theodore Parker. His sermon was on good and evil temper. Text: "Better is a dinner of herbs where love is than a stalled ox and hatred therewith." I don't like him at all, and wish I had worshiped at King's Chapel with dear Mr. Peabody, whom, with his whole family, I love.

Afternoon. Went to hear Father Taylor. A good sermon, but I think the old man is failing. He insisted on my going to his house afterwards. He was at first inclined to be severe about my leaving the Methodist Church. "Brother," said I, "if I could only be like some of the New England Methodists, and say, I don't believe the Trinity, I would have done so; but Methodism here and in the Baltimore conference differ." The old man relented. "Well," said he, "our southern brethren are very strict about what they know nothing of."

Why I didn't like Parker's sermon on good and evil temper I know not. Being still a Methodist, except as to the Trinity, I may have been in the spiritual frame of the colored brother in Georgia, who was distressed when the Rev. Sam Jones, during a revival, thought it best to give his converts some exhortation of a moral

kind. "Brother Jones," said he, "when you preach about the Ten Commandments, you kind o' throw a damper on the whole thing."

I met Emerson about that time, and he told me to go again to the Music Hall. "There," he said, "you will hear the one sane voice." Another entry.

"March 10, 1853. Theodore Parker is helping me to find Ben Williams, a fugitive [slave] from our neighborhood, aunt Nancy's husband."

How well I remember that exploration of the negro quarters! Late in the night, as I was leaving Virginia, a woman belonging to my father implored me to find her husband, fugitive from a neighbor, hiding in Boston; to help him if he were suffering; to send her some tidings of him.

Then I learned how deep and far the pulses of Parker's heart had gone. I can hear yet the fervent "God bless you, Sir!" of those poor negroes on their great friend. He said, "Here is a Virginian seeking a fugitive, but do not fear him." They would have trusted me then if I had held handcuffs, and ere long I found my man.

As we were on our way, an old woman asked us the way to the Catholic Church. He gave her the direction, most politely, and remarked presently: "A heretic may point a soul to the true Church."

Meanwhile he was pointing me to the Music Hall, and there I heard the great sermons. Every one had the reality of an occasional utterance. There I sat with the people under his simple speech, listening breathlessly, with now a smile rippling over us, and now a tear falling, and went away fed, satisfied.

Most of us were poor in the Divinity School; we of Parker's flock used to walk from Cambridge and back to save the money; but we went back rich to our dinner (literally) of herbs. For the teacher had spoken to each intimately, to his condition; as, when the shepherd god Krishna played his flute, each maiden believed she had him for a partner in the dance. He was a great preacher. His thoughts were mother-thoughts; they were not only maternal, but bore other thoughts.

I remember one morning, when the fugitive slave, Anthony Burns, was imprisoned, his petition for the prayers of the congregation for his deliverance was found by the preacher on his desk. He opened, and slowly read it, then said: "I am not disposed to ask God to do our work." That one sentence is the seed of a new religion, and one that will be permanent.

Next day, when a secret council met to consider what should be done with the fugitive, Parker began his remarks with the words: "I cannot counsel a risk, I am not prepared to share;" and thereafter each adviser said calmly precisely what he was prepared to carry into action. And with equal responsibility his every

word was spoken. His spirit was that of one who came not to be ministered unto but to minister.

One mournful day, when some graduates in divinity came to tell him that their choice of him to address their class had been overruled,—an unprecedented thing,—he calmed their indignation. None knew until after his death how deeply he had been wounded.

Ah, great-hearted teacher, the time has come when they with us say: "Blessed were he who should come with the love and power, and the fidelity of Theodore Parker!" And by thy stripes we, thy children, are healed. Thy work is achieved. Thy congregation may be dismissed. We are free.

TWO ERRORS OF AGNOSTICISM.

IN REPLY TO MR. PAUL R. SHIPMAN

MR. PAUL R. SHIPMAN starts with the idea of the Unknowable, which he conceives as the substance that underlies all changes. It is the real Proteus, no Mene-laus may seize, much less to hold. Mr. Shipman announces as self-evident that "what lies beyond the grasp of our knowing faculties, we cannot know."

This tautological judgment is formally correct. But we add, that every real existence lies within the possible grasp of cognition.

We observe in nature around us many processes taking place, and we notice that there remains something unchanged in all the changes. This may be called substance, but we object to its being characterized as unknowable. We know or at least can know all about substance that is real, and that is all we want to know; that which is unknowable in substance is unreal and non-existent. For the Unknowable is identical with the impossible, the self-contradictory, the unintelligible, that which has neither rhyme nor reason. Existence and knowability are identical.

Reality is properly called *Wirklichkeit* in German, derived from *wirken*, to take effect. Reality is no immovable and unchangeable Proteus, but the effectiveness of things in their relations. Reality therefore does not mean absolute existence, but existence and the manifestation of existence also. Existence and its manifestation are not two different things; both are one.

The idea of something absolutely unknowable is therefore untenable; it would imply the existence of an object whose existence is not manifested; *i. e.*, without reality; *Sein ohne Wirklichkeit*—which is a contradiction, an impossibility. Existence, reality, and cognizability are synonymous terms.

Insolvable problems are by no means such as are too profound for solution but such as are wrongly stated. This truth is splendidly illustrated in the following little poem* by Adeline V. Pond.

* *Wide Awake* for April, 1889, p. 336:

It was a small and foolish child who met the Great Wise Man,
And opening wide his Question-Bag, 'twas thus the child began:

"O, Great Wise Man, I've questions here that long have puzzled me,
And if you've answers that will fit, I'll buy me two or three.

"First, can I make a new pig's ear out of my old silk purse?
Is killing time like eating dates, or is it really worse?

"Next, what do little fishes do to keep their stockings dry?
And, since the water is so wet, how do they ever cry?

"Pray, what's the fish that gives us scales wherewith we weigh our words?
Could people really kill a stone, if they should use two birds?

"Then, last of all, please tell me, sir—and this is question seven—
Is't raining up or raining down, when they have rain in heaven?"

The Great Wise Man thought hard and fast: his finger-ends he bit;
He searched in vain his Answer-Book for answers that would fit.

At last he said: "I know great things; when I was very young,
In nine and ninety languages I learned to hold my tongue.

"And backwards, even when asleep, or standing on my head,
In child's Chinese and grown folks' Greek, my tables oft I said.

"The higher mathematics—they seem very low to me—
I know in Heidelberg's Great Tun how many gills might be.

"The thousand answers in my Book, will tell you things like those,
But what you ask I cannot tell; and so, there's no one knows."

The Great Wise Man went on his way, as great and wise men will;
I fear me much that foolish child is small and foolish still.

Mr. Shipman proposes a truce between Christianity and Agnosticism. He recognizes the merits of existing institutions and does not so much want them to be abolished as to be developed to higher and purer forms until the last establishment winds up "in the midst of heaven on earth."

We sympathize with Mr. Shipman in his appreciation of Christianity, but we cannot believe with him in that "heaven on earth"; a state of "absolute perfection," as Mr. Spencer expresses himself,—a state in which the adaptation to ends is perfect. Such an idea is not compatible with the law of evolution. We have in many respects reached the ideal of former ages, and nevertheless we are infinitely far from absolute perfection. Many of the most pressing needs of the past are now, under more favorable conditions, satisfied; but new wants have risen under the very influence of civilization, so that it appears as if progress itself were injurious, making us dissatisfied with things with which our ancestors were more than contented.

That heaven on earth, accordingly, is a chimera, which to him who is not able to create a heaven of contentedness for himself under the given conditions, always appears to be at a far distance, either in the past or in the future.

Schopenhauer says that human happiness may be likened to a fraction, the denominator of which represents our wants and the numerator their satisfactions. Every progress allows each of the two to increase; and it would be a vain hope ever to expect to

have the millennium on earth realized. Absolute perfection is an impossibility.

Whether the doctrine of atonement is to be considered as "the real characteristic of Christianity, the core and essence of it," we shall not discuss. Christianity has differed greatly in different ages and among different people. We have no quarrel with Christianity and no one should have any objection to it, if it is to be considered as the religion of love. But we are at war with those who identify Christianity with Supernaturalism. The worshiper of the Supernatural, like the Agnostic, believes in the Unknowable; he will and he does greet Agnosticism as his strongest ally, for he says with Kant: "I must abolish knowledge in order to make room for belief."

Supernaturalism thus abolishes faith and places in its stead creed. Faith need not be in contradiction to science and philosophy. There is such a thing as rational faith. But creed stands in contradiction to positive knowledge. Creed is irrational as a matter of principle, as Augustine says: *Credo quia absurdum*; and creed, irrational creed, has its safest basis on the principle of Agnosticism.

P. C.

THE SITAHARANAM; OR, THE RAPE OF SITA.

AN EPISODE FROM THE GREAT SANSKRIT EPIC "RAMAYANA."

TRANSLATED INTO ENGLISH BY PROF. ALBERT H. GUNLOGSEN.

III.

THE illustrious Raghuid having imparted these orders to Lakshmana and made up his mind to kill the deer, sallied forth in order to follow its track. He seized his bent bow, inlaid with golden ornaments, and fastened to it his quiver; he slung the golden-hilted sword across his shoulders, and clad in a coat of mail, he at once started for the forest in pursuit of the antelope.

Then Maritcha fled before him with the swiftness of the wind; but Rama soon closed in upon him. The fiend in his mad career through the Dandaka-forest trembled with fear of Rama, and at times he entirely disappeared out of sight, but in the next instant was seen again.

Rama followed with the utmost speed, while the stag at alternate intervals would be in sight, and as suddenly bound off, in its terror of being hit, enticing Rama still farther and farther. Seen, lost to sight, alarmed, again darting off, then slackening his pace, or stopping, thus Maritcha in his head-long flight sped through the forest of Dandaka.

When at last Rama coming up to the phantom-stag, thought to have him near enough, full of wrath he drew his bow; but the stag also had perceived Rama coming up bow in hand, and in a trice he had vanished out of sight, yet instantly again reappeared;

thus, at alternate brief intervals, near and far off, by his sudden starts mocking Rama, and enticing him still deeper into the wilderness.

Like the veiled orb of the moon in autumn from behind fitting, black clouds, so the stag by turns was concealed, and again revealed to the pursuing Rama.

And thus the Kakutstha Rama had to hunt the animal through the entire length of the forest in alternate fits of anger at the mocking illusion before him.

At last it was brought to a stop, while seeking a shelter beneath the grassy shades of the wood, and was seen closely surrounded by a multitude of stags, standing motionless, their eyes wide-open with terror.

The generous Rama also kept him in sight, and being resolved to dispatch him, he drew his powerful bow, and laid a deadly arrow on the string. Aiming at the stag, he sent off the fiery arrow, created by Brahma, and shot Maritcha through the heart—alas, the powerful missile struck him in the heart!

For a moment he struggled to rise, but from his wound he again sank to the ground; and there the big-toothed Raksha-fiend remained in all the glory of his assumed form. As he thus lay writhing with pain, his fearful groans were heard all around.

But then, in his hour of death Maritcha recalled to mind his master's love; and in a loud voice the evil one imitated Rama's voice, shouting: O Lakshmana! so that it echoed three times through the forest. Such was his disposition even in his hour of death!

For if Sita in her solitude from concern for her husband sends Lakshmana hither, then deprived of him, she would fall an easy prey to Ravana. This he bore in mind, while emitting the false sound, in his dying hour evincing his devotion to his master, Ravana. Then, leaving his stag-like form, he again assumed that of a Raksha; and in his death his body swelled to enormous dimensions.

But, on perceiving that he had felled only a hideous Raksha, Rama's soul at once flew back to Sita, and he felt overwhelmed with anxiety.

Looking with contempt upon the loathsome corpse of the killed Raksha, with a heavy heart he returned homeward, by the same path he had come.

IN MEMORY OF LIEUT. HUGH WILSON MCKEE,
U. S. N.*

(KILLED IN ACTION.)

BY LOUIS BELROSE, JR.

WHEN to the beat of muffled drums we follow
A comrade to the grave, with measured tread,
Solemn and slow,
We march to mournful music of the dead;
But as we turn to go,
Quickened step and cheerful strain
Lead us back to where remain
Life and strife and joy that laughs at woe.

* Read at the dinner of the U. S. Naval Academy Graduates Association.

It is not well that Death
Should take, with one man's breath,
The hope and courage of the friends that stay;
And cause, while summer shines
A blessing on the vines,
Despair to fill the heart that should be gay.

What strength we have we need
To plow and plant the seed
That came, a birthright, from the general store,
And make two blades of grass
To flourish, ere we pass
Away, where one blade used to grow before.

But let not Time that dries
The tear in Love's own eyes
Erase the memory of those who fall.
I drain a glass to-night,
In Death and Time's despite,
To shipmates gone before us, one and all.

And one more glass to those
Whom partial Fortune chose
To plant our colors where the laurels grow;
A bumper to the dead
Whose willing hearts have bled
In battle, with their faces to the foe!

Fill out the roll of Fame!
Let every date proclaim
Its own, and where they fell, by land or sea.
When those who rank have done,
I'll take, for 'Sixty-one,
The first man killed in action, Hugh McKee.

One versed in gentle ways,
With lips that loved to praise,
And simple-hearted, as the truly great;
Whose soul, in poet-wise,
Drank azure from the skies,
Whose red blood swelled the venging arm of hate:

Who durst, in times grown old
With worship of dull gold
And mean observance of an empty breath,
Choose honor, undefiled
With cant; and when she smiled
Beyond the waiting parapet, choose Death.

Ay, *choose!* not killed like one
Of thousands, having done
The simple duty of the soldier well;
But leading where the brave
Came all too late to save,
Within that far Corean citadel.

At Buena Vista, won
Though twice the setting sun
Could doubt, his father charged and saved the day;
And both, for this fair land,
Fell fighting sword in hand:
O Alma Mater, nourish such as they!

CORRESPONDENCE.

A PROFESSORSHIP OF EVOLUTION.

To the Editor of THE OPEN COURT:—

I MUST steal time just to say how fully I endorse what Dr. Cope says of a Professorship of Evolution. Just now our colleges are biologically stumbling about for lack of a clear conception of

this doctrine which takes up all the facts of history and reduces them to a science. So also our liberally inclined ministers with their churches are groping for the positive and generally grasping only the negative. The one want of our age is biology in our higher institutions, taught by men not under bondage to creeds, but bound only to facts and truths.

Truly yours,

CLINTON, N. Y., 1889.

E. P. POWELL.

CONFISCATION.

A REPLY TO MR. HUGH O. PENTECOST,

THE communication of Mr. Pentecost in No. 93 of THE OPEN COURT, is tenderly introduced as an "Explanation." I call it a confession. I think I have a right to call it so, because I conducted the cross-examination which procured it. After evading me like quicksilver for about three months Mr. Pentecost now acknowledges that my interpretation of the vanity known as "Georgeism" was correct, and that in spite of his taunts, and insinuations to the contrary I did "understand the question," and did know "what I was talking about." Not often does a witness break down under cross-examination so completely as Mr. Pentecost has broken down. He now says:

"Georgeism does involve the practical confiscation of land by the government. In *form* it leaves the present owner of land an owner still; but, in *fact*, the government becomes the owner. * * *

"When a majority of the people of this country come to see that the private ownership of land is a *crime against humanity*, as chattel slavery was a crime against the negroes, then the land will be confiscated just as the slaves were freed. * * *

"Wheelbarrow seems to think that if he can fix the charge of confiscation upon Georgeism he has dealt it a heavy blow. On the contrary, that is what we Georgeites glory in. We mean to utterly destroy the private ownership of land by confiscating *ground-rent*. * * *

"*Ground-rent* would be all that any one would have to pay to government. The land would all be confiscated—taken away from the present owners without compensation, just as we now take a stolen horse away from a horse-thief or away from him to whom the horse-thief sold him."

Considering how these explanations contradict those which Mr. Pentecost gave us in THE OPEN COURT, Nos. 83 and 91, there is droll comedy in the question. "Is there any possibility of Wheelbarrow's failing to understand the thing this time?"

To that I answer: How can I fail to understand it? The purpose to confiscate is declared. How can any man fail to understand the "Georgeites" when they say: "We mean to utterly destroy the private ownership of land?" A reference to the former numbers of THE OPEN COURT will show that I always understood it so, and that Mr. Pentecost did not. If he did, he concealed his understanding from us by pretending that Tom Clark would be better off under "Georgeism," and that his farm would be burdened with taxes amounting to little or nothing. Mr. Pentecost now declares that the purpose of Georgeism is to take Tom's farm away from him entirely, as if it were a stolen horse.

I earnestly call the attention of Mr. Albro and Mr. Williamson, who immediately follow Mr. Pentecost to his astonishing confession; and I ask them, not in taunt or triumph, but as fellow searchers after truth, whether it is not a waste of arithmetic to figure up the probable amount of Tom Clark's taxes, when only the *form* of his farm is to remain to him while the *fact* and substance of it are to be taken away?

The comparisons of Mr. Pentecost are discordant and confused. There is no likeness between a slave and a farm, nor between the emancipation of a slave and the confiscation of land. The slaves were not confiscated; they were freed. It is true that Gen. Butler in the early part of the war did confiscate some slaves, under the prevarication that they were "contraband of war"; a mischievous pretense, which proved to be a sophism both in ethics and in politics. About the same time I had the honor to emanci-

pate a slave who had taken refuge in my camp. I did it on grounds opposite to those assumed by Gen. Butler. I refused to give the negro up, not because he was a chattel forfeited, but because he was a man, and therefore impossible to be contraband of war. I expose the inaptitude of Mr. Pentecost's comparisons because it is the habit of social reformers to press into the service of their argument the emancipation of the slaves. We commit a solecism when we compare a scheme of serfdom to that splendid achievement of liberty.

I use the word serfdom with deliberation because the ownership of land has ever been the political distinction between a freeman and a serf. The ownership of land is the sign and title of a freeman, the inspiration of his patriotism. His very estate is called a freeholding, or a freehold, and he himself is called a free-holder. Every tenure below the grade of a freehold is politically "*base*," and I am informed that it is technically so in law. To confiscate all the farms in the United States, and to compel the farmers to hold their lands as tenants at will to "Government" would substitute a base tenure for a free tenure; it would practically reduce farming to a menial business, and farmers all to serfdom. Fancy the ragged condition of American freedom when all the farms and all the town lots in the country are confiscated by the government and thrown into politics. Imagine the confiscation done in 1839. The farms are all owned by the government and the letting them out begins. Would a democrat get a lease if a republican wanted it? Not one. The corruption growing out of such a system would breed Chaos. The spirit of freedom may die out everywhere else, but on the hearth-stone of the freehold the fires of liberty burn for ever. It is a perverted philanthropy which seeks to improve society by abolishing the freehold.

Again Mr. Pentecost invites me to read "Progress and Poverty." There is kindly patronage in the invitation, and I gratefully accept it, although I think that the weakest debater on any subject is the shiftless disputant, who, when he has had enough of the controversy throws a whole book at his adversary, and tells him to read that. However, I will read it once more to please Mr. Pentecost, and while I am about it, will Mr. Pentecost gratify me by reading Sir Thomas More's Utopia, and a few chapters in Don Quixote.

WHEELBARROW.

INDIVIDUAL USEFULNESS.

To the Editor of THE OPEN COURT:—

In the many interesting articles upon poverty or labor reforms that have appeared in your paper there is one view that seems neglected. Both the incapacity of many poor, and the injustice of the circumstances surrounding classes of working people, need attention and removal. But since this after all depends upon the will and interest of humanity at large, some attention should be paid to finding a motive strong enough to arouse this will and interest. All know that if there were some widespread scheme for endowing each individual with powers to control circumstances, instead of the mere ability to succeed when all circumstances were favorable, the question would be settled. Many institutions are at work presumably in this very direction, Education, Religion, Charity; but in the first place it is no one's business to inquire whether they are doing the work well or ill, and in the second it needs the common sense of all the world, and this will never be given until it is proved that it would *pay* to elevate the masses.

Poverty never has existed because mother Earth could not furnish enough for all her children. There will never be enough truffles and diamonds to go round, it is true, but fortunately only a small number find them indispensable. As for necessities and comforts, science waits always on tip-toe to double and triple the resources as fast as we find the keys to unlock her undeveloped stores. But the greatest drug in the market is a class of in-

dividuals who have nothing in the world to do with hands and head but give the minutest attention and care, and who are sinking daily into greater incapacity because they are not giving it. The poorest of humanity has his fourteen hours a day to spend in some way, the most ignorant has a capacity for something. It is a self-evident truth also that lack of money is not the cause of poverty, and neither is it lack of work though this seems the most constant complaint. What is work? Only manufacturing, building, mining, washing and ironing, teaching, etc.? Because these, and a few other occupations satisfied our forefathers' needs, are there never to be others? There are countless occupations lying in the womb of the future, waiting for comprehensive thought to develop them and the executive ability to prepare untrained humanity for them. It is the thinking power that is lacking more means for work or people to do it, but no one seems to be raising a hue and cry about this want, serious as it is.

Why do business enterprises cease producing and throw their employees out of work? Because there is an excess of the supply over the demand; that is, there are not consumers enough. Then lack of consumers is the cause, not the selfishness of the producers; and this is the case in all the business walks of life. Musical interests suffer for lack of audiences, art for lack of buyers, hotels and restaurants for lack of those who must have the delicacies of life; educational institutions are never self-supporting for lack of those who value what they can give. Now if more consumers were an impossibility, there would be an ethical right to demand that producers gauge their productions by this fact; but since consumers can be multiplied indefinitely, the blame must be shifted on the power that fails to multiply. Here waits this multitude of honest poor who barely live, and of the vicious and indolent who do not know what living is, and every individual of the number is a latent machine for consuming luxuries, wearing fine and expensive material, and keenly enjoying expensive pleasures; and every one who is lifted from this life of bare existence to one where it becomes a necessity for him to have the best of life, even if he has to work for it, is adding so much to the world's wealth.

It would be able to convince the thinkers and people of leisure, that it was not at all the workingmen's business to furnish themselves with the training that would enable them to conquer adversity and not constantly succumb to pressure of circumstances and so recruit the class below; that it was not even their business to furnish the motives for making the most of their abilities. They are already doing the heaviest half of the world's work. They give their time, their lives, their hope of heaven sometimes, to the doing of this work that enables the upper class to have every material benefit at hand with the freedom from care, and the broad cosmopolitan view that is vitally necessary for the working out of these complex problems. Does this entail no obligations upon every individual so benefited? A money return is not enough. It is thinking power that the world is suffering for. What is done with this dearly bought ease and leisure? As a rule it is spent in a frantic chase after pleasure, or a still more frantic effort to kill the time that is purchased with the sweat of the brow, the aching sinews, and the stifled aspirations of millions of working people. It is a fearful thought that the class that relieves the rest of the world from the drudgery and makes real living possible and worth while for them, should fare the worst of all.

Every being born into the world adds to the work and care of the world; but also, he brings with him his modicum of time and the ability to be fitted for some position, however humble, so that he may at least not retard the world's work. If he is not so fitted, he becomes a recipient without making a return, and so is a burden; some who possess millions are as truly a burden as a pauper. Every person not so fitted means that in some more favored walk in life some one else is also taking their share of the work of all and making no return.

MARY CRAGGE.

THE MONISM OF ALEXANDER POPE.

To the Editor of THE OPEN COURT:—

I WOULD ask you how your Monism differs from these lines of Alexander Pope:

"In Nature's chain, whatever link you strike,
Tenth or ten thousandth breaks the chain alike
Or in the full creation leaves a void.
Where one link's broken the whole chain's destroyed.
For all are but parts of one stupendous whole,
Whose body Nature is and God the soul."

Pope was in the wrong, however, in writing, as now is proven to be false; namely if I well remember it:

"The world in darkness dwelt and night,
Until God said, let Newton be, then all was light."

For the true philosophy of light—the undulating—had been discovered by Wilhelm Huygens, and however desperately the followers of Sir Isaac Newton have since fought for him and his doctrine—the corpuscular—the true philosophy of light as taught by the great philosopher of Holland, has at length triumphed by the *experimentum crucis*. Nor was Sir Isaac Newton the first discoverer of the laws of gravitation? for Kepler, surnamed the "Legislator of the Skies," taught the principles of gravitation, and Descartes, if I recollect the name aright, had made the calculations of the distances of several of the planets before ever Sir Isaac saw that famous wormy apple fall. In a word, science in America, following in old English tracks, seems to be in deep ruts, and such criticisms as we see of Kant, and Spencer, Huxley and the rest, looks like the dialectics of the middle and dark ages wherein words and not substantial things were paramount. In the meantime what the world requires most must ever be a system by which the hungry may be fed and naked clothed in order to make peace on earth and good will to all mankind, for the origin of all evil is in want, and the true name of the Devil always must be want, in whatever Protean forms it may appear, whether in canonicals, or regimentals, or the rags of tramps going hungry as roaring lions and seeking what or whom it may devour. Nor is it any positive system of Political Economy that is most required now but rather a certain set of principles of social science, by which the exertions of mankind may be directed according to the exigencies of each case as the want arises and that according to the universal principle of adaptation according to the conditions at the time prevailing, with time and space, and benevolence and wisdom as conditions precedent.

Respectfully,

NEW YORK CITY.

CLINTON ROOSEVELT.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXVII.—Continued.

The Princess sat near the speaker, her head supported on her arm, looking sorrowfully before her.

"My beloved Princess does not hear me speak in this way for the first time," continued the Lord High Steward. "I have often felt anxious about the dangers which a high-flown spirit and active fancy prepare for you, the cradle gift of an envious fairy, who has made your Highness too brilliant and attractive. It is owing to these brilliant gifts that you have not the same aristocratic nature as your illustrious brother, the Hereditary Prince. There is too lively a desire in you to make yourself appreciated, and to influence others. One

* Translation copy righted.

can leave your brother with full confidence to his own good nature. Every attempt to persuade the soul of the much-tormented child has come to naught. But you, that delicate artistic work of nature which now gazes at me with those open eyes, I have endeavored constantly to guard from an over-refined coquetry of sentiment. I am now the severe admonisher to high duties, because I anticipate the dangers which this love of conquest in your soul will bring upon yourself and others."

"I hear a severe reproof in loving words," replied the Princess, with composure. "I should marry again in order to become distinguished."

"My dear Highness, I wish that you may obtain this great aim as the wife of a husband who is not unworthy of your devotion. Only in this way can a princess expect true happiness. Even this happiness cannot be gained without self-denial, I know it; it is difficult to every one to control themselves. To those who are born in the purple this virtue is ten times more difficult than to others. Forgive me," he continued, "I have become talkative, as often happens to us old people at Court."

"You have not said too much, my friend, nor too little," said the Princess, much moved. "I have always cherished the hope to live on quietly for myself, surrounded by men who would teach me the highest things that it is possible for a woman to acquire. On this path also I find tender duties, noble bonds which unite me with the best, and such a life also would not be unworthy of a princess; more than one have, in former times, chosen this lot, and posterity respects them."

"Your Highness does not mean Queen Christina of Sweden," replied the High Steward. "But to others also this lot has seldom been a blessing. Your Highness must remember that when a princess surrounds herself with wise men, she means always one man who is to her the wisest."

The Princess was silent, and looked down.

"We have now long discussed the possible position of a princess," began the old gentleman; "let us now consider the fate of the men who would be united by tender bonds to the life of an illustrious lady. Granted that she should succeed in finding a friend, who, without unseemly pretensions, would attach himself with self-denial and real devotion to the active and varied life of a princess. He must sacrifice much and forego much; the right of the husband is that the wife should devote herself to him, but in this case a man must fetter the powers,—nay, even the passions of his nature,—for a woman who would not belong to him, whom he could only cautiously approach at certain hours as a friend unto friend; who would consider him at first, to a certain extent, as a

valuable possession and a beautiful ornament, but finally, under the best circumstances, as a useful bit of furniture. The greatest sufferer in such a position would be the artist or scholar. I have always felt compassion for the walking dictionaries of a princely household. Even men of great talent then resemble the philosophers of ancient Rome, who, with the long beard and the mantle of their schools, pass through the streets in the train of some distinguished lady."

The Princess rose, and turned away.

"Better, undoubtedly, is the situation of the man," concluded the High Steward, "whose personality allows him to guide, by silent work, the life-current of his high-born friend. Yet even he must not only himself lose much of what is most delightful in life, but, even with the purest intentions, he will not always be able to give pleasure to his princess. He who would be more than a faithful servant diminishes the security of his princely mistress. Should such chivalrous devotion be offered, a noble woman should hesitate to accept it, but to endeavor to attract it does not become a princess."

Tears rushed to the eyes of the Princess, and she turned quickly to the old man.

"I know such a life," she exclaimed; "one that has been passed in unceasing self-denial—a blessing to three ladies of our family. O my father, I know well what you have been to us; have patience with your poor ward. I struggle against your words; it is a hard task for me to listen to you, and yet I know that you are the only secure support that I have ever had in this life. Your admonitions alone have preserved me from destruction."

Again she seized his hand, and her head sank on his shoulder.

"I loved your grandmother," replied the old man, with trembling voice; "it was at a time when such things were lightly thought of. It was a pure connection; I lived for her; I made daily self-sacrifice for her. She was unhappy, for she was the wife of another, and her holiest duties were made difficult to her by my life. I guarded your mother like an anxious servant, but I could not prevent her from being unhappy and dying with the feeling of her misery. And now I hold the third generation to my heart, and before I am called away I would like to impress my life and the sufferings of your mother as a lesson on you. I have never been so anxious about you as I am now. If my dear child has ever felt the heart of a fatherly friend in my words, she should not lightly esteem my counsel now, whatever brilliant dreams it may dispel."

"I will think of your words," exclaimed the Princess. "I will endeavor to resign my wishes; but, father, my kind father, it will be very hard for me."

The old gentleman collected himself, and interrupted her.

"It is enough," he said, with the composure that befitted his office; "your Highness has shown me great consideration to-day. There are others who also desire their share of your Highness's favor."

There was a knock at the door. The waiting-woman entered.

"The servant announces that Lady Gotlinde and the gentlemen are waiting in the tea-room."

"I have still some business with his Excellency," answered the Princess, gently. "I must beg Gotlinde to take my place in entertaining our guest."

* * *

Evening had descended upon the castle-tower, the bats flew from their hiding-places in the vacant room; they whirled about in circles, astonished that they had awoke in an empty habitation. The owls flew into the crevices of the tower, and searched with their round eyes after the old arm-chairs, on which they had formerly waited for the stupid mice; and the death-watch, which the scholar had carried down from the lonely room, gnawed and ticked on the staircase and in the rooms of the castle among living men. The rain beat against the walls, and the stormy wind howled round the tower. The wife of the scholar was driving through the night, flying like a hunted hare; but he was pacing up and down his room, dreamily forming from the discovered leaves the whole lost manuscript. And again he wondered within himself that it looked quite different from what he had imagined it for years.

The wind also howled about the princely castle at the capital, and large drops of rain beat against the window; there, also, the powers of nature raged and demanded entrance into the firm fortress of man. The darkness of the night seemed to pervade the halls and the decorated rooms like gloomy smoke; only the lamps in the pleasure-grounds threw their pale light through the window, and made the desolate look of the room still more dreary. The melancholy tones of the castle clock sounded through the house, announcing that the first hour of the new day was come. Then again silence, desolate silence, everywhere; only a pale glimmer from the distance on the covers of the chandeliers and the golden ornaments of the walls. Sometimes there was a crackling in the parquet of the floor, and a draught of wind blew through an open pane upon the curtains, which hung black round the window like funeral drapery. Here and there fell a scanty ray of light on the wall, where hung the portraits of the ancestors of the princely house in the dress of their time. Many generations had dwelt in these rooms; stately men and beautiful women had danced here. Wine had been poured out in golden goblets; gracious

words, festive speeches, and the soft murmur of love, had been heard here; the splendor of every former age had been outdone by the richer adornment of later ones. Now everything had vanished and withered; the darkness of night and of death hung over the bright colors. All those who had once moved about and rejoiced in the brilliant throng, had passed away into the depths. Nothing now remained of these hours but a dreary void and dismal stillness, and one single figure which glided about on the smooth floor, noiseless like a ghost. It was the lord of this castle. His head bent forward as in a dream, he passed along by the pictures of his ancestors.

"The timid doe has escaped," he whispered; "the panther made too short a spring: in rage and shame he now creeps back to his den. The powerful beast could not conceal his claws. The chase is over; it is time to set at rest the beatings of this breast. It was only a woman—a small, unknown human life. But the jade Fancy had bound my senses to her body; to her alone belonged whatever remained in me of warmth and devotion to human kind."

He stopped before a picture, on which fell the gloomy light of an expiring lamp.

"You, my steel-clad ancestor, know what the feeling is of him who flies from home and court, and has to give up to his enemy what is dear to him. When you fled from the castle of your fathers, a homeless fugitive, pursued by a pack of foreign mercenaries, there was misery in your heart, and you cast back a wild curse behind you. Still poorer does your descendant feel, who now glides fleeting through the inheritance that you have left him. To you remained hope in your hard heart; but I to-day have lost all that is worth the effort of life. She has escaped my guards. Where to? To her father's house on the rock! Cursed be the hour when I, deceived by her words, sent the boy among those mountains."

He dragged himself onward.

"The third station on the road to the end," he meditated, "is idle and empty play, and puerile tricks. So said the learned pedant. It coincides; I am transformed into a childish caricature of my nature. Miserable was the texture of the net which I drew around her; a firm will could have broken it in a moment. He was right; the game was childish: by a stroke of a quill I wished to hold him fast, and, before the art of the Magister had accomplished its purpose, I disturbed the success of the scheme by the trembling haste of my passion. When the news comes to him that his wife has fled, he also will pack up his books, and mock me at a safe distance. Bad player, who approached the gaming-table with a good method, to put piece after piece on the green cloth, and who in his madness flung down his purse and lost all in one throw. Curses

upon him and me! He must not escape from me; he must not see her. Yet, what use is there in keeping him, unless I encase his limbs in iron, or conceal his body below, where we shall all be concealed when others obtain the power of doing what they will with us? You lie, Professor, when you compare me to your old Emperors. I am alarmed at the thought of things which they did laughing, and my brain refuses to think of what was once commanded by a short gesture of the hand. A ball and dice for two," he continued; "that is a merry game, invented by men of my sort; as it turns up, one falls and the other escapes. We will throw the dice, Professor, to see which of us shall do his opponent the last service; and I will greet you, dreamer, if I am the fortunate one that is carried to rest. Does thy wit, philosopher, extend far enough to see thy fate, as happened to that old astrologer, of whom thy Tiberius inquired about his own future? Let us try how wise you are."

He again stood still, and looked restlessly on the dark pictures.

"You shake your heads, you silent figures; many of you have done injury to others; but you are all honorably interred, with mourning marshals and funeral horses. Songs have been sung in your honor, and learned men have framed Latin elegies, and sighed that the golden shower has ceased that fell upon them from your hands. There stands one of you," he exclaimed, gazing with fixed eyes on a corner; "there hovers the spirit of woe, the dark shadow that passes through this house when misfortune approaches it—guilt and atonement. It passes along bodiless to frighten fools, an apparition of my diseased mind. I see it raise its hand—it scares me. I am terrified at the images of my own brain. Away!" he called out, aloud, "away! I am the lord of this house."

He ran through the room and stumbled; the black shadow hastened behind him. The Sovereign fell upon the floor. He cried aloud for help through the desolate space. A valet hastened from the anteroom. He found his master lying on the ground.

"I heard a shrill cry," said the Sovereign, raising himself up; "who was it that screamed above my head?"

The servant replied, trembling:

"I know not who it was. I heard the cry, and hastened hither."

"It was myself, I suppose," the master returned, in a faltering tone; "my weakness overcame me."

* * *

In the early morning the Professor called to the Castellan, and rushed up the staircase of the tower. He went about the room, pushing boards and planks in all directions; he found many forgotten chests, but

not that which he sought. He made the Castellan open each of the adjoining rooms; went through garrets and cellars; he examined the forester, who lived in a house near by, but the latter could give him no information. When the Scholar again entered his room, he laid his head on his hands; prolonged disappointment and the consciousness of his impotence overmastered him. But he chid and restrained himself.

"I have lost too much of the cool circumspection which Fritz said was the highest virtue of a collector. I must accustom myself to the thought of self-resignation, and calmly examine the hopes which still remain. I must not be ungrateful also for the little I have gained."

He could not sit quietly by the discovered leaves, but paced thoughtfully up and down. He heard voices in the court-yard; hasty running in the passages; and at last a lackey announced the arrival of the Sovereign, and that he wished to see the Professor at breakfast.

The table was spread among blooming bushes on the side of the tower that faced the rising sun. When the Professor entered under the roof which protected the place from rain and the rays of the sun, he found there, besides the household and Marshal, the forest officials and the Lord High Steward, who thought, with more anxiety than the Professor, of the sudden arrival of the Sovereign. The old lord approached the Scholar, and spoke on indifferent subjects.

"How long do you think of remaining here?" he asked, politely.

"I shall request permission to return to the city in an hour; I have accomplished what I had to do."

It was a long time before the princely party appeared. When the Sovereign approached them, all present were struck by his ill appearance: his movements were hurried, his features disturbed, and his looks passed unsteadily over the company. He turned first to the forester, who was in attendance, and asked him, harshly:

"How can you tolerate the disagreeable screaming of the daws on the tower? It was your business to remove them."

"Her Highness the Princess last summer requested that the birds be left."

"The noise is insupportable to me," said the Sovereign; "bring out the weapons, and prepare yourself to shoot among them."

As the practice of shooting was one of the regular country pleasures of the Court, and the Sovereign had, even in the neighborhood of the castle, frequently used his gun on birds of prey or other unusual objects, the Court thought less seriously of this commission than did the Scholar.

(To be continued.)

BOOK REVIEWS.

THE PERICOSMIC THEORY OF PHYSICAL EXISTENCE AND ITS SEQUEL—Preliminary to Cosmology and Philosophy Proper. By George Stearns. Published by the Author. Rockbottom, Mass. Price, \$2.00 postpaid.

HEREIN the author has grappled with the grand problems of physics with such success that as Bacon said of the fruit of his own meditation, "he has judged it to be for the interest of the present and future generations that they should be made acquainted with his thoughts."

The concepts and beliefs of the author relating to his topics differ more or less from those now current among physicists, despite his protest that his theory "is strictly scientific."

Thus he grounds the entire *Cosmos* in Force. It would seem to be the notion of the author that the Universe in its totality may be imagined as an immense plum-pudding spinning about an axis, the dough of which is "The Ether," which as he is fully persuaded in his own mind is an atom—an indivisible unit of *concentric force*, p. 23. In this all-including atom of ether are distributed the material atoms which are also "infinitesimal globules of *concentric force*," p. 55. It is the belief of the author that the atomic plums of material *concentric force* would be driven by the ethereal *concentric force* to its centre, unless prevented by the revolution of the pericosmic ether with "condign" velocity so as to generate an equivalent "*excentric force*," p. 28.

From the best comprehension the reviewer has been able to gain after much re-reading and study—although he cannot see that the author is consistent with himself—*concentric force* is subject to two "categories," *static force* and *motoric force*. "Static Force is that which permits without motion; as gravity, the cohesion of atoms, or that of which the atoms consist," p. 39. "Motoric Force is that which is inherent to its own vehicle," and the author gives as examples, rotation of atoms, gravitation, and planetary motion, p. 39. The author speaks also of *motific force*. "Motific Force is nothing but the "virtual cause of motion, the embrace of matter by the ether."

So it would appear that this goodly frame is a composite of drives, spins, and squeezes of force. Now drives, spins, and squeezes are themselves forces, so that force by the pericosmic theory is the *summun genus* of the physical universe. As to what force is, the author is explicit. It is "the perpetual exertion of creative power by the author of mundane existence," p. 263. "The concept of force is that of a power produced by some agent and sustained continuously by continuity of its inceptive agency," Preface, p. vii. "It, in all its guises, must be perpetually created." "There is but one modality of causation relevant to corporeal stability or endurance and that is the incessant creation of force * * * hence Theism, entailing by deduction all that is rationally desirable," Preface, p. viii.

How admirable the office of a master mind! Here by the simple recourse to "creative power" which every one fully comprehends, perplexity gives place to complete lucidity. But why should our author himself infringe on his own method? He will not ascribe the "colligation" of the properties of matter to the "immediate agency of creative power;" for, as he protests, "to do this were to abandon science and don the sacred veil of mystery," p. 35.

According to our author the all-including Ether is finite because "a *concentric force* must have a centre which is impossible without a circumference," p. 22. It is "discoïdal," p. 60, though "aboriginally spherical," p. 27; impenetrable, p. 21, yet "implied with matter the atoms of which were widely dispersed," p. 60; which atoms move in the Ether, p. 61, "displacing" it, p. 46, and "distinct" therefrom, p. 33. It is frictionless, p. 50, yet its "vehicular motion" causes the atoms to move with it, p. 61. It is "incompressible," p. 21, yet elastic, p. 32; "perfectly im-

pressible," p. 24, with its elasticity a function of its pressure, p. 24; perfectly solid (not rigid), p. 23, yet "collapses" behind moving bodies, p. 52. It must possess inertia for its rotation causing its "aboriginal" spherical shape to bulge out into its "discoïdal" form, p. 60, and yet as we remember it is nothing but "concentric force."

Corresponding to the properties of the Ether the material atoms therein as well as the statics and dynamics of both are supposed with corresponding licenses. With such constituents has been erected "The Pericosmic Theory," in which "the Ether and Matter are to each other as the two pillars of an arch whose keystone is the shoulder of Atlas," p. 58.

We are free to say that we have not read this book of over three hundred pages through. Why should we? *Ex pede Herculem*. If a book assuming to discourse on American affairs should be handed us, the first pages of which manifested that its author supposed Americans to be negroes subsisting by buffalo hunting and governed by counts of counties: that its capital, Washington, was just across the line from British Columbia; that cotton was sheared off from the bark of the forest trees, and petroleum made from corn, we should be able to say with approximate truth that the book would prove contemptible.

Besides, by the systematic use of strange polysyllables in place of apt, familiar, and brief terms clamoring to be used, and the unnecessary use of a multitude of obsolete words of which 'to inchoate,' 'centrifugation,' 'coetaneous,' and 'indagation' are samples, the author makes a style of text that with his inadvertencies and confusions is more difficult to construe than a foreign tongue.

In fine, the serious notice of such books as this is a lapse from that becoming dignity that genuine science and philosophy should maintain save for the purpose of giving point to a lesson that these owe to themselves, to the unwary, and especially to the ignorant, conceited pretenders that perennially sprout in spite of the industry of the fool-killer. That these latter are not only not malicious but willing to devote their good money to disseminate their rubbish is insufficient excuse. The practical mischief effected by them in their uninstructed but officious devotion is much the same as though malice prompted. Self-dubbed as science or philosophy, their productions are most apt to engage the attention of those who are incompetent to discern their demerit, especially that pestilent class, ambitious to be singular and officious to defend, any paradox they may have patronized with their last gust of crudity. Real science and philosophy is thus defamed and balked of its proper due far more than by its open enemies.

It is interesting to contemplate the ecstasy of conceit that must possess these scientific and philosophic *dilettanti*. Mark the lofty contempt they must feel for the incompetence and inadvertence of the great army of plodding *savants*. They must regard them as so incapable and dull that in spite of exhaustive study of the works of the foremost men of all the world, and in spite of lifelong application after special preparation to their various specialties, they never once can think of the solutions of the difficulties they meet, until some stroller happens their way and by the magic of his superior mentality, unhelped by preparation or discipline, "heaves off" the open sesame.

Why should genuine science and philosophy "dissemble its love" for such virtual impostors? Why should not a spade be called a spade? Why should not those who comprehend the real situation, tell the superficial quacks to go and inform themselves concerning the topics of their discourse and they will see the depth of their ignorance and conceit? What has science to do with an Ether that is both impenetrable and penetrable, frictionless and friction exercising, incompressible and elastic, solid and collapsing, inert and active? What has philosophy to do with creative power?

FRANCIS C. RUSSELL.

MAKING BREAD DEAR.

A CONTROVERSY BETWEEN
WHEELBARROW and SYMPATHIZER

UPON
Corners and The Board of Trade

WITH REFERENCE TO
THE LABOR QUESTION.

PRICE, 10 CENTS.

This little pamphlet is a reprint from the columns of *The Open Court* of an able and spirited controversy between Wheelbarrow and a prominent Chicago financier. The title indicates the subject. Wheelbarrow attacks the combinations of trade that "make bread dear and laborers cheap." Sympathizer declares Wheelbarrow's article a misrepresentation of facts, and characterizes it as misleading and obscure. Wheelbarrow replies, explains more fully his position, and contends that the arguments of Sympathizer have only strengthened the stand he has taken. The discussion is of practical men, and forms an interesting chapter in economics.

TO ADVERTISERS!

For a check for \$20 we will print ten-line advertisement in One Million issues of leading American Newspapers and complete the work in ten days. This is at the rate of only one-fifth of a cent a line, for 100 Circulation! The advertisement will appear in but a single issue of any paper, and consequently will be placed before One Million different newspaper purchasers; or FIVE MILLION READERS. If it is true, as is sometimes stated, that every newspaper is looked at by five persons on an average, Ten lines will accommodate about 7,500,000 persons. Address with copy of Ad., and check, or send 50 cents for Book of 256 pages.

GEO. F. ROWELL & CO., 108 BRUCE ST., NEW YORK.

We have just issued a new edition of our Book called "Newspaper Advertising." It has 256 pages, and among its contents may be named the following Lists and Catalogues of Newspapers:—

DAILY NEWSPAPERS IN NEW YORK CITY, with their Advertising Rates.

DAILY NEWSPAPERS IN CITIES HAVING more than 20,000 population, omitting all but the best.

DAILY NEWSPAPERS IN CITIES HAVING more than 10,000 population, omitting all but the best.

A SMALL LIST OF NEWSPAPERS in which to advertise every section of the country; leading to choice selection made up with great care, guided by long experience.

ONE NEWSPAPER IN A STATE. The best one for an advertiser to use if he will use but one.

BARGAINS IN ADVERTISING in *DAILY Newspapers* in many principal cities and towns, a List which offers peculiar inducements to some advertisers.

LARGEST CIRCULATIONS. A complete list of all American papers issuing regularly more than 25,000 copies.

BEST LIST OF LOCAL NEWSPAPERS, covering every town of over 5,000 population and every town of over 2,000.

SELECT LIST OF LOCAL NEWSPAPERS, in which other advertisements are inserted at half price.

477 VILLAGE NEWS-PAPERS, in which advertisements are inserted for \$2.15 a line and appear in the whole lot—one-half of all the American Weekly Book sent to any address for **THIRTY CENTS.**

THE TEACHER'S OUTLOOK.

Published by The Teacher's Publishing Company, Des Moines, Iowa. A monthly magazine devoted to the interests of teachers and advanced pupils and intended to supplement the good work done by other school journals rather than to occupy the same field. Instead of filling its columns with school methods, school aids, and the details of school work, it will aim to interest the teachers in matters outside of the atmosphere of the school room, and its columns will furnish an Outlook upon affairs of life, facts in science and nature which illustrate and test the theories of the schools.

In this work it will hope to furnish the teacher with a natural source of inspiration and mental energy, quicken thought and make the school room a place joyous with buoyant spirits that offer a responsive greeting to the inquiring minds of youth, rather than heavy with that gloom and dullness which often surrounds the daily toil. A leading feature of the magazine will be a monthly review of current events, civil and industrial problems, scientific inventions, discoveries, etc.

Another feature will be a very complete Review of current Literature, especially of all books and magazines coming within the sphere of its readers. We have entered into arrangements with all the leading publishers to keep us informed of all their new and prospective publications, and the Reviews will be made by competent critics.

Still another feature, and a very important one as giving a practical value to the Outlook offered, will be the formation of a circle of writers out of its subscribers from which it hopes to draw its corps of contributors. This plan is original as applied to a magazine, and is based on the idea of co-operation, or mutual helpfulness. If met with it will be the means of introducing many new writers to the public, and of aiding many who now lack the training in the expression of thought necessary to get their literature into which their tastes would lead them. \$1.50 per year. Single copies 15 cts. Good pay to agents.

THE

Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY
By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects

1. *The Psychology of the Cell—Introductory.*
2. *The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.*
3. *The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition; Predatory Habits of Certain Animalcula.*
4. *Colonies of Unicellular Organisms.*
5. *Fecundation of Proto-Organisms.*
6. *Fecundation of Higher Animals and Plants.*
7. *The Physiological Function of the Nucleus.*
8. *Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.*

The monograph of M. Binet is an important contribution to comparative psychology. It presents the results of the most recent researches, and draws from sources inaccessible to the majority of scientific readers—the reports and publications of foreign societies. Here may be instance, apart from the author's original investigations, the researches of Balbiani, Claparède and Lachmann, Macpup, Ribot, Hœckel, Engelmann, Espinas, Pouchet, Weber, Pfeffer, Kunt, Dujardin, Gruber, Nussbaum, Bütschli, Lieberkühn.

In a preface written especially for the American edition, M. Binet confutes the theory of the English scientist, Dr. G. J. Romanes, that the first appearance of the various psychical and intellectual faculties is assignable to different stages in the scale of zoological development.

10 mo, 135 pages. Cloth, 75 Cts, Paper, 50 Cts.

DEFINITIONS EXPLANATORY OF THE POSITION OF
"THE OPEN COURT."

THE DATA of experience are perceptions.

REALITY is the sum total of all that is.

TRUTH is the conformity of cognition to reality.

[Truth being a relation between subject and object appears to be relative in its nature. Absolute truth is a self-contradiction; it would imply cognition without a cognizing subject.]

At the same time it is obvious that absolute existence (in fact everything absolute) is impossible. Reality is properly called *Wirklichkeit* in German, derived from *wirken*, to take effect. Reality is not immovable and unchangeable absoluteness, but the effectiveness of things in their relations. Reality therefore implies not only existence, but the manifestation of existence also. Existence and its manifestation are not two different things; both are one.

The idea of something absolutely Unknowable is therefore also untenable; it would imply the existence of an object whose existence is not manifested *i. e.*, existence without reality; *Sein ohne Wirklichkeit*—which is a contradiction, an impossibility.]
SCIENCE is the search for truth.

The nature of science is the economy of thought. (*Mach.*)

Economy of thought is possible through application of the laws of form to thought.

KNOWLEDGE is the possession of certain truths.

[Knowledge is, so to say, the present stock or capital with which Science works. Science cannot exist without knowledge. The object of Science is not only to increase and enlarge knowledge but also to purify the present stock of knowledge from vagueness, errors, and misconceptions.]

The purpose of knowledge is that of increasing our power over nature.]

MONISM is that philosophy which recognizes the oneness of All-existence, and the Religion of Monism teaches that the individual, as a part of the whole, has to conform to the cosmical laws of the All.

RELIGION is man's aspiration to be in harmony with the All.

[Religion has been defined differently in the columns of THE OPEN COURT, but all definitions that have been presented are in strict agreement. Mr. Hegeler in No. 25, defines Religion as "man's union with the All" (taking the definition from the Lutheran Catechism "Religion ist der Bund des Menschen mit Gott durch Gott," and replacing the Word God by the more comprehensive word THE ALL). The editor has defined Religion as "man's consciousness of his relation to the All" (No. 24); as "Das Allgefühl im Einzelnen," the All-feeling in the individual (see foot-note page 965); as "man's conception of the world that serves him as a guiding-star through life" (page 1180).]
MORALS are man's conduct in so far as it is in unison with the All.

[The basis of morality is religion. A moral educator or preacher may justly be asked, "On what authority dost thou justify thy precepts?" And he will tell us that his authority is not personal; he speaks in the name of universal order. Accordingly his authority is that of religion. If it were not so, all his good precepts would have no foundation; they would hover in the air like beautiful dreams that have no reality.]

ETHICS is the Science of Morals; it teaches man why he must, and how he can, regulate his conduct so as to be in unison with the All.

Natural history and the history of mankind prove that here on earth a constant progress takes place developing ever higher forms of existence.

Morally good are those acts which are in harmony with the All, *i. e.*, those which enhance progress, and *morally bad* are those which are not in harmony with the All, *i. e.*, those which retard or prevent progress.

[Religion (man's aspiration to be in unison with the All) has naturally produced many superstitious notions in the world, of its origin, and of its purpose. Similarly, science (man's search for truth) has produced many errors or false notions of reality. But all the superstitions of religion do not prove that religion as such is an illusion, and all the errors of science are no evidence that science as such is a sham.]

It is obvious that religion and science, as here defined, are not contradictory to, but complementary of, each other. If religion and science do not agree, it is a certain sign that our conception of either the one or the other is wrong. The history of the human mind has been one of constant conflict and reconciliation between religion and science. Their relation has repeatedly been disturbed and re-adjusted.

The unitary conception of the world affords the only basis for the union of Religion and Science, and opens a new vista of progress for both.]

REVIEW OF RECENT WORK OF "THE OPEN COURT."

The work of THE OPEN COURT, for the past eight issues, covers a wide range of subjects. In an article in No. 87, "The Universal Faith," Mr. T. B. WAKEMAN, of New York, discusses the foundations of a "monistic, positive, human, constructive religion." In the number preceding, an editorial essay points out and emphasizes the radical difference between religious Creeds and religious Faith. Then follow in Nos. 87, 88, and 89, respectively, the articles "Agnosticism and Auguste Comte's Positivism," "Space and Time," "Formal Thought and Ethics," "Personality, Individuality, Consciousness," is the title of an essay (No. 87) by M. TH. RIBOT, the eminent French psychologist, translated with his consent from *Les Maladies de la Personnalité*. It contains the gist, one may say, of the principles from which modern psychology sets out. Dr. FELIX OSWALD contributes, in No. 88, a paper on "Dreams and Visions," an interesting study; and in No. 89, Mr. A. H. HEINEMANN writes effectively upon "The Preservation of Moral Purity in Children."

In criticism, appears the striking article from the French of ALFRED FOUILLEE, entitled "M. GUYAU'S Faith." The paper "The Transient and The Permanent in Theodore Parker" (No. 91), is Part I of a discourse held by Mr. MONCURE D. CONWAY at the dissolution of Mr. Parker's Society. Three articles (Nos. 90, 91, 92.) upon "The History of the People of Israel" are worthy of every reader's careful perusal. The author, Prof. CORNILL, is an orthodox theologian of Königsberg; his researches are marked by critical acumen, spirit, and above all a love of truth. A unique feature of the last few numbers is "The Sitaharanam," a translation from the Sanskrit, by Prof. ALBERT GUNZGENSEN.

In Economics, the controversy between "WHEELBARROW" and "SYMPATHIZER," Nos. 78, 85, 86, 88, occupies the first place. The subject is "Making Bread Dear." WHEELBARROW is well known to readers of THE OPEN COURT; SYMPATHIZER is a prominent Chicago citizen.

ELECTRICAL WAVES AND RAYS.

THE EXPERIMENTS OF PROF. HERTZ.

BY THOMAS J. MCCORMACK.

Of the various methods by which the transmission of energy is effected, that of wave motion plays, in physical procedure, perhaps the most prominent rôle. In this manner, the energy that constitutes light, heat, and sound is propagated. Physicists, in the former two instances, have assumed that there exists in the universe an all-pervading, tenuous, subtle, and imponderable medium called the ether. This ether, by hypothesis, is the vehicle of those forms of motion which are manifested as the physical phenomena of light and heat. The evidence for the existence of the ether, or luminiferous ether as it is sometimes called, is entirely cumulative. We have no direct proof of its presence. Tentative experiments, and the universal applicability to physical phenomena of the laws deduced from its assumed properties, have alone verified it. In fact, the theory that light is a form of wave motion, generated in the luminiferous ether, has only within the last century received universal recognition; and that heat is an undulatory movement of the same medium, has been admitted only within the last fifty years. At the present day, it is the working basis of optical and thermal science.

Recently the attention of physicists has been directed to numerous phenomena which point to the conclusion that the medium of electro-magnetic action is identical, in the properties it exhibits, with the luminiferous ether. Various researches had established the intimate connection between light and electricity; the old dualistic theory of two kinds of electrical substances had been definitively overthrown and the unitary doctrine of Franklin gained supremacy. But the latter was not theoretically developed, and the researches first mentioned were not comprehensive enough to command conviction. In 1858, Clerk Maxwell, following in the foot-steps of Faraday, who was the first to assume a medium in space as the vehicle of electrical and magnetic action, published his theory of electro-dynamic phenomena. Maxwell suggested the idea of a medium whose properties would account for the phenomena of light *as well as* the phenomena of electricity; in other words, the medium of electro-

magnetic action was identified with the luminiferous ether. The theory was philosophical, and its capital merit lay in the fact that it tended to the unification of two great branches of physical science.

Until the recent researches of Prof. Hertz, of Karlsruhe, however, this theory had not been confirmed by direct experimental proof. In a series of communications addressed to the Berlin Academy, Prof. Hertz has established, with a remarkable degree of certitude, the hypotheses propounded by Maxwell. It may now be said, without fear of refutation, that in the province of electricity we have to deal with wave motions. We may now speak, with scientific propriety, of rays of electricity; showing that, in the same manner as light, they also are subject to the laws of reflection, refraction, and polarization.

It is the purpose of this paper to present, in brief, the results of Prof. Hertz's investigations.

1.

The main difficulty in the way of verifying by experiment the theory of Maxwell arose from the enormous velocity with which electrical disturbances are propagated. Electrical actions are perceptible only at a distance of a few metres from the conductors in which they originate. They traverse that distance in a few hundred millionths of a second. And it seemed impossible, by a mechanical contrivance, to generate electric phenomena under conditions that allowed the experimenter to follow, in so short a space of time, the phase and manner of their production. But Hertz found a means of exhibiting, in a visible manner, a difference of phase representing a space of time less than the thousandth part of a millionth of a second. This means was the electric spark. The contrivance used was that commonly employed in electrical experiments: a conductor interrupted at some point, the ends formed by the break being furnished with small knobs, between which the sparks dart. This contrivance may be called, in the description to follow, a spark-micrometer or spark-transit.

The arrangement, from which the office of the spark may be shown, is seen in Fig. 3. Near a primary closed circuit, containing an inductorium *A*, from which the current proceeds, is placed another circuit, a rectangle of wire, interrupted by the spark-

micrometer *M*. Let a point *e* in the second circuit be joined by a wire with a discharging-rod of the inductorium. Now the difference of electrical state between any two points in the first circuit by virtue of which electricity performs mechanical work in moving from the one point to the other—comparable to the flow of water from a higher to a lower level—is termed the difference of potential. This difference of potential, or difference of electrical state, is by the connection made transmitted in both directions towards the spark-micrometer *M*. If the point *e* is equidistant from the two knobs of the spark-micrometer, and both parts of the second circuit are symmetrical, the difference of potential will arrive at both knobs in the same phase and no sparks will pass between them. But upon moving the point *e*

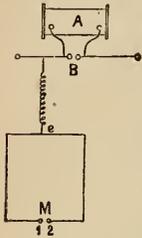

Fig. 3.

either to one side or the other, a sharp stream of sparks is excited in the micrometer; showing that the difference of potential requires more time, in one branch of the secondary circuit, to reach the micrometer than in the other, and that the phases of the difference of potential are, at the same moment of time, different in the two knobs. Now we know that the velocity of electric propagation in wires is 20–30 cm in the thousandth part of a millionth of a second. Consequently, this difference of phase must represent a space of time correspondingly short.

It may now be shown that the transmission of the difference of potential in the second circuit is effected by a wave-motion; in other words, that electromotive force—the supposed force to which transfer of electrical action is due—is propagated by undulations. If a wire or other body through which a current is passing, be brought in the neighborhood of another wire, the familiar phenomenon of induction occurs; namely, a second current is set up in the second wire. Here the first wire is termed the primary conductor; the second, the secondary conductor. Now, in Fig. 4, let the primary conductor consist of two rectangular plates of brass, *A* and *A'*, perpendicularly set and joined together by an horizontal copper wire 60 cm in length. In the middle of the wire let a break be made, across which sparks may pass.

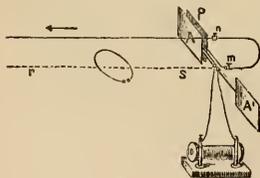

Fig. 4.

This break we will call the spark-transit, and let the terminal knobs, or poles, of the same be connected each with a pole of an inductorium. The straight line *vs*, perpendicular to the wire and passing horizontally through the spark-

transit, may be known, in the phraseology of Hertz, as the basal line; the zero-point of which lies, say, 45 cm away from the spark-transit. The secondary conductor here, is the circle-shaped copper wire (rad. 35 cm) seen in the figure, which is likewise broken to form a spark-transit. Behind the plate *A* was placed a plate *P* of equal size, from which a copper wire 1 mm in thickness proceeds. This wire was bent, in the manner represented in Fig. 4, to a point *n*, lying some 30 cm above the basal line, whence it ran parallel with the latter. At a distance of 8 mm from the zero-point it was terminated. The secondary conductor was now carried towards the free end of the wire in a manner such that its plane passed through the same; whereupon a stream of sparks, extremely weak, was visible. The sparks increased in length however, when the conductor was moved towards the zero-point; attained at a certain spot their highest value, and afterwards grew smaller. The points at which they all but vanished were situated approximately at an equal distance apart.

This phenomenon is hardly explainable otherwise than upon the hypothesis that the differences of potential existing at the origin of the wire, in the plate *P*, are propagated forward in the wire in the form of waves; so that at every point of the wire the potential varies between two extreme values, just as an ether particle, oscillating in a ray of light, executes vibrations about a position of equilibrium. Having arrived at the free end of the wire, the waves are thrown backwards, and by the intersection of the reversed waves with the original waves, permanent waves are formed with nodes and loops of vibration. The nodes of vibration are formed in the wire at the points where the sparks in the secondary conductor disappear.*

But the distance between two nodal points, or between two points where the disturbance is in the same phase, represents half a wave-length. A simple means, consequently, is afforded us of determining the length of a wave of electricity. This, in the present instance, Hertz found to be 2.8 m. The time of vibration and velocity of propagation also enters into consideration. From verified formulas Hertz deduced the value of both; the velocity of propagation was found to be in approximate agreement with the results obtained by other investigators.

A similar experiment, in proof of regular undulations, may be cited. Let the primary conductor *AA'* in Fig. 5 be conceived in a horizontal position. Facing the two knobs were arranged two metallic plates *a a*, from which two parallel wires proceeded, to a distance of 10–20 m. The observer took his position between the wires, so holding the secondary conductor *B* that its plane lay perpendicular to the two wires,

*Naturw. Wochenschrift, IV. 1: Dr G. H. von Wyss.

and the break in the circuit uppermost. Starting from the extreme end of the wire, sparks several millimetres in length were observed. On coming nearer to the primary conductor, the sparks at once fell off and at a distance of 1.5 m from the end suddenly disappeared.

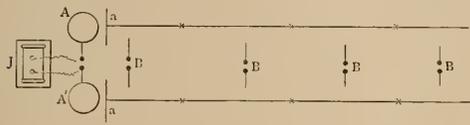

Fig. 5.

At a distance of 3 m, they reappeared, at 4.5 m they again vanished, and the phenomenon was periodically repeated at equal intervals. The same explanation will, as in the former case, account also for what happens here. The waves originating in the primary conductor are propagated to the end of the wire, where they are thrown back; the reflected and direct waves interfere and give rise to a system of fixed oscillations. (The nodes of vibration are marked in the figure by small crosses.) It is certain, therefore, that the primary conductor is the seat of isochronous oscillations, and that it sends forth regularly undulating waves.

In further support of the undulatory theory of electrical propagation, may be cited a well known phenomenon of acoustical science: the phenomenon of resonance. If a tuning-fork be brought in the neighborhood of a sounding-board capable of executing vibrations of exactly the same periodicity, the latter instrument will be set vibrating, and will produce a tone exactly the same as the original, and thus add to its intensity. Upon this analogy, Hertz reasoned that a current of uniform oscillation, under conditions otherwise the same, would have a much more powerful effect by way of induction upon a circuit of the same periodicity of vibration, than upon one whose periodicity differed, be it, by only a slight amount. His experiments to establish this were successful. By altering the capacity or the potential either of the primary or the secondary conductor, the sparks produced in the latter were, as the case might be, stronger or weaker; and they attained their greatest length, when the capacities and potentials were so adjusted that the times of vibration deduced from their values were equal for the main and secondary circuit. When, in Fig. 4, the secondary conductor was 'attuned' to the wire *mn*, that is, when the times of vibration of the two conductors were equal, the sparks evoked in the adjusted circuit were always more powerful than when the times of vibration did not accord.

11.

And now to the more recent experiments demonstrating the properties of electrical rays in space. In

the description of apparatus and phenomena, we shall adhere, as closely as the limits of the article allow, to the text of Prof. Hertz's memoir: *Ueber Strahlen Electricischer Kraft*.*

The propagation of electric waves in space, Hertz had already succeeded in establishing. His efforts were now directed towards confining the action of electrical radiation and thus making its effects perceptible at much greater distances. To this end the device of a large parabolic mirror, into the focal line of which the primary conductor should be placed, was hit upon. The misproportion between the dimensions of the mirror used and the wave-lengths first employed (4-5 m) resulted in the failure of the original experiments. Afterwards, shorter wave-lengths were selected (one-tenth the former) and the mirrors so adjusted that the results exceeded Hertz's highest expectations. The following explanation of the apparatus used, will be a sufficient introduction to the description of the phenomena to follow. (See Figs. 1, 2_a, and 2_b.)

The primary conductor consisted of a cylindrical piece of brass 3 cm in diameter and 26 cm in length, interrupted midway by the so-called spark-transit, the poles of which were spherical surfaces 2 cm in radius. The length of the conductor was thus nearly equal to the half wave-length of the corresponding vibration in straight wires. The polar surfaces had to be frequently polished during the experiment, and carefully protected from illumination caused by simultaneous lateral discharges; otherwise the oscillations fail. The discharge is carried to the two sections of the conductor by two wires overlaid with a thick gutta-percha covering, entering near the spark-transit on either side. A small inductorium of Keiser & Schmidt was used. With the latter instrument sparks of 1-2 cm in length could be generated; for the experiment the poles were brought together to a distance of 3 mm.

The proof of electrical force present in space was, as usual, shown by the production of sparks in a secondary conductor, for which a continuous circuit was used, having approximately the same time of vibration as the primary. The secondary conductor had a diameter of only 7.5 cm and was made of a copper wire 1 mm thick. One end of the wire bore a polished knob of brass of several millimeters diameter; the other end was pointed and by means of a delicate, insulated screw adjusted at a very short distance from the brass knob. The experimenter had to deal with sparks of several hundredths of a millimeter in length, so that brilliancy more than length was a guide to their presence.

The circular conductor is not adapted for attachment in the focal line of a concave mirror; accordingly

* *Annalen der Physik und Chemie*. New Series. Vol. XXXVI, pp. 759-783.

the following arrangement was principally employed. Two straight pieces of wire, 50 cm in length and 5 mm in diameter, were fixed in a straight line, with their adjacent ends about 5 cm apart. (See Figure 2 *b*.)*

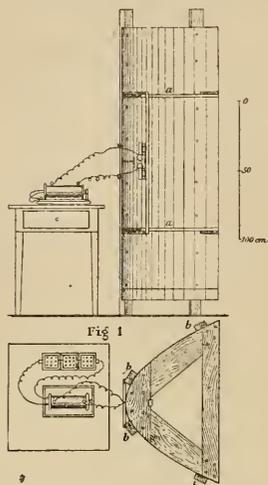

Fig 1

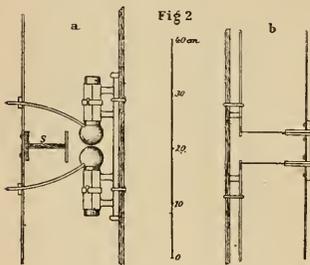

Fig 2

order to observe and adjust the spark-transit fixed in the focal line, the observer necessarily obstructs the opening of the mirror.

THE PRODUCTION OF ELECTRICAL RAYS.

Placing, now, the primary oscillator in the centre of a spacious and open apartment, Hertz began to explore the surrounding field with his circular con-

* DETAILED EXPLANATION OF APPARATUS.

Fig. 1 represents a transverse and vertical section of the emitting mirror. The stand is constructed of two horizontal braces, parabolic in form, and of four wooden uprights fastened with screws to the braces and constituting thus a support for the latter. The specular metal is forced in between the braces and the supports, and secured to the same by numerous screws. Above and below the uprights extend beyond the metal, to be used as handles in moving the stand about. Fig. 2 *a* represents, upon an enlarged scale, the arrangement of the primary conductor. The two metallic divisions slide tightly into envelopes of strong paper, which are kept closed by two elastic bands of rubber. The envelopes are further secured to a small strip of wood by four supports of sealing-wax; the strip being fastened by rubber bands to a wooden stay, also visible to Fig. 1. The rubber-covered conducting wires enter two holes bored in the knobs of the primary conductor. This arrangement affords the various parts the necessary flexibility, and can be taken apart in few mo-

ductor. The greatest distance within which sparks were evoked in the secondary conductor, was 1.5 m; under favorable condition of the primary spark-transit, 2 m. The effect in any one direction is increased, if on the opposite side of the primary oscillator a level conducting screen be placed, at the proper distance, parallel to the same. If the distance chosen is very small, or a little greater than 30 cm, the screen operates detrimentally; but accumulatively if at a distance of 8–15 cm; at a distance of 45 cm its cumulative effect is feeble; and at greater distances, zero. From this fact and results obtained in former investigations, Hertz concluded that the undulation in the air corresponding to the primary oscillation had a half wave-length of 30 cm.

An additional increase of intensity was predicted, upon substituting for the level screen a concave parabolic mirror, with the focal line of which the longitudinal axis of the primary oscillator is made to coincide. The focal distance of the mirror must be chosen as small as possible, if the effect at a remote point is to be well concentrated. But the focal distance must not be much smaller than one-fourth of a wave-length, lest the direct wave immediately neutralize the effect of the reflected one. A focal length of 12½ cm was accordingly chosen, and the concave mirror constructed of a sheet of zinc 2 m long, 2 m wide, and ½ mm thick, bent in the proper form, over a wooden frame of exact curvature. The height of the mirror was 2 m, the width of the opening 1.2 m, its depth 0.7 m. The primary oscillator was fixed in the middle of the focal line. The wires carrying the discharge passed through the mirror; the inductorium and elements were behind the same, offering no interference.

Upon exploring the vicinity of the oscillator with conductors, no effect was perceptible behind and side-wise from the mirror; in the direction of the optical axis, however, sparks were produced to distances of 5–6 m. For greater distances, as for 9–10 m, sparks were perceptible in the neighborhood of a level conducting screen which was placed at right angles to the forward traveling waves. Here the waves thrown

ments, which is required by reason of the surfaces of the poles having to be frequently polished. At the points where the conducting wires pass through the mirror, they are invested during the discharges with a bluish light. To keep the latter as far as possible removed from the spark transit whose capacity of action is thereby considerably weakened, the screen *s*, constructed of smoothly planed wood, is placed between. Fig. 2 *b* represents the secondary spark-transit. The two sections of the secondary conductor are similarly fastened to a stay of the frame by supports of sealing-wax and rubber bands. From the inner terminal points of these sections, the rubber-covered conducting wires pass through the mirror and bend towards each other. The upper wire carries a small brass ball for a pole. To the lower wire a piece of a watch spring is soldered which carries the second pole, a fine copper point. This point is purposely selected of a softer metal than the ball; without this provision the point easily penetrates into the ball, and the tiny sparks are lost sight of in the hollow formed. It is seen from the cut how the movements of the point are regulated by a screw pressing upon the spring, but insulated from it by a small glass plate. The object of the peculiar bend of the spring is to regulate the movement of the point with more accuracy than could be done by the use of the screw alone.

back from the screen strengthened, at certain points, those directly approaching. At other points, conversely, the consequence of the meeting was to weaken the effect. With the straight conductor, in front of the screen, distinct *maxima* and *minima* were discoverable, and in the circular conductor phenomena of interference, characteristic marks of constant waves, were produced. Four nodal points, thus, were distinguished; one in the screen, and the others at distances respectively of 33, 65, and 98 cm from the same. Approximately, therefore, the value of the half wavelength of the waves employed in the experiment was 33 cm, and the time of vibration one one-thousandth-millionth of a second; assuming the velocity of light to be here the rate of propagation. These phenomena were discernible only in the neighborhood of the optical axis. Hertz accordingly called the physical formation thus produced, an electrical ray, emitted from the concave mirror.

A second mirror, exactly like the first, was now constructed, and the rectilinear secondary conductor was so placed in it, that its two (50 cm in length) wires fell in the focal line, while the wires leading to the spark-transit passed, insulated, through the wall of the mirror. The spark-transit was thus brought directly behind the mirror and the experimenter could arrange and observe it without interrupting the course of the waves. Hertz believed that if successful in catching the ray by this arrangement, he would be able to detect its presence at much greater distances. The result verified his belief. The sparks were perceptible from one end to the other of the laboratory in which the experiments were conducted. The greatest distance the ray was followed, was 16 m. For purposes of experiment, however, a distance of 6—10 m is the most convenient, since the sparks in the secondary conductor, beyond this distance, perceptibly weaken.

The simple phenomena, now to be described, characterize the action of an electrical ray. Where not otherwise indicated, the focal lines of the mirror are always taken to be vertically placed.

RECTILINEAR PROPAGATION.

When a screen of sheet-zinc 2 m high and 1 m wide was placed between the mirrors, in a plane perpendicular to the direction of the ray, the secondary sparks would completely disappear. A screen of tin-foil or gold-paper had the same effect. If a person comes into the line of the ray, darkness follows in the secondary spark-transit; passing out of the field of the same, the spark-transit again becomes luminous. Insulators do not intercept the ray. It passes through a screen of wood or a wooden door. The secondary oscillator

and mirror were placed in an adjoining, closed room, and to Hertz's surprise sparks were in this instance also evoked in the secondary transit.

Two conducting screens, 2 m high and 1 m wide, were stationed symmetrically to the right and the left of the line of the ray, perpendicular to the same. So long as the space between the screens is not smaller than the aperture of the mirrors, viz., 1.2 m, the secondary sparks are not effected. If the intervening space be diminished, the sparks decrease in intensity and when the distance between the screens is made less than 0.5 m, disappear.

Leaving the width of the space 1.2 m, but moving the screens symmetrically sidewise from the line of junction of the mirrors, the sparks vanished as before. If the optical axis of the emitting mirror was turned 10° to the right or left of the proper position, the secondary sparks grew perceptibly weaker; upon turning the same 15°, they disappeared.

The ray, accordingly, has an exact geometrical boundary; the "shadows" have not. Phenomena were easily producible, which were analogous to those of diffraction. Hertz did not succeed in observing *maxima* and *minima* at the edge of the shadows.

* * *

The reflection, refraction, and polarization of electrical rays will be illustrated in a subsequent number.

YOUTH AND OLD AGE.*

BY FELIX L. OSWALD, M. D.

IN the course of the last fifty years, biologists have repeatedly called attention to the curious fact that the growth of a human body from infancy to old age corresponds closely to the evolution of the human type from the lower forms of animal life.

A conclusive—perhaps, indeed, the most conclusive—argument in favor of Monism is the circumstance that the mind accompanies the body in almost every step of that progressive development. Nay, the slight divergence from the exact lines of the parallel is, in certain respects, more fatal to the delusions of mental dualism than the Darwinian theory is to the doctrine of special creation. A few years ago the physiologist Virchow was so far misled by the excitement of partisan controversy as to maintain that a large plurality of our dumb fellow creatures have no soul at all, and that only in the highest animals we can notice anything analogous to the phenomenon of a mental process. "For the benefit of a benighted world," remarks Karl Vogt, "the Herr Professor will perhaps condescend to explain at which precise stage of evolution that

* Copyrighted under "Body and Mind; or, The Data of Moral Physiology." Part XXIV.

mysterious entity, called a mind, suddenly enters the hitherto inanimate organism of a poor brute."

At which special period of growth, we might also ask, do our dualistic friends suppose their supernatural soul to have entered the tabernacle of the human body? There was a time when the nations of Europe, even on the shores of the Mediterranean, had scarcely emerged from the most brutish depth of barbarism, and when nevertheless their physical development could have furnished models for the chisel of a Phidias. It is equally certain that the mind of a child has not far advanced beyond the mental status of a cuttlefish at a time when its body already displays the essential characteristics of the human type. Of anything analogous to reason an infant of five or six months shows fewer glimpses than a newborn monkey or a newly hatched turkey-chick. One day after emerging from the shell of the egg young turkeys already stop their twittering cackle at the first warning of the parent bird, and at the approach of a hunter will scatter in all directions and manage to become invisible at half a minute's notice, crouching down flat under the projecting knob of a gnarled root or under a tuft of tangled weeds, and keeping absolutely still, till the rallying cry of the hen announces the departure of the enemy. Young monkeys will aid their mother in espying the first symptoms of danger and at once loosen their grip on her arms and cling closely around her waist when the sudden appearance of a panther gives the signal for a headlong flight through the tree-tops.

Young children, on the other hand, have to acquire the full use of their motive organs before their mind gives evidence of any decided advance above the level of a rather limited type of instinct; and it is a remarkable fact that the rapidly developing youngsters of certain savages show a corresponding degree of mental precocity. Bishop Heber and Mrs. Colin Mackenzie testify to the curious intelligence of Hindoo babies, who begin to prattle and take care of still younger infants at an age when an English child would be unable to crawl out of its cradle. The traveler Vambéry speaks of a Turkestan girl of four years, who, in the absence of her parents, received a troop of strangers and asked them to excuse the scant accommodations of the little cabin, while she bustled about to collect the wherewithal of a breakfast; and Captain W. C. Baldwin (*African Hunting*, p. 224) mentions his experience with a still more precocious young Hottentot. "On the same day I was obliged to buy a little Massara boy," he says, "a toddling infant, certainly not more than two years old, whom a gang of native hunters had picked up in an abandoned camp. I could not bear the thought of leaving him to die of hunger and thirst in the desert, and his

intelligence soon made me quite fond of him. * * * It was a sight to watch the waddling little brat come, armed with a stick twice as long as himself, to help me corral the oxen, and the way he toddled along to make the calf fast without my ever telling him! When my Kaffirs had left our camp, the poor little fellow slept at my feet, and somehow seemed to know that something was wrong, as he kept starting up and feeling for my knees, touching them with the greatest gentleness, and then lying down again."

After the sixth year the mental development of a child progresses with often astonishing rapidity, just as nations, unfettered by the trammels of priestcraft, are apt to rise rapidly from barbarism to a considerably advanced stage of civilization. Jean Jacques Rousseau justly remarks that it is far easier to civilize a healthy barbarian than to restore the lost health of an over-civilized nation, and the high state of culture attained by the conquering Saracens within less than a century after their exodus from the desert-camps of Araby, contrasts, indeed, strangely with the intellectual torpor of many once civilized races. But a still more curious fact is the general diffusion of intelligence among certain nations of pagan antiquity, who in industry and material resources were far behind many third-class powers of modern times. It would almost seem as if the very lack of industrial activity had left the Greeks of the classic era more leisure for abstract speculations, and a similar circumstance might partly explain the remarkable intelligence of care-free children. The smaller wants and less complicated social relations of childhood favor a greater distinctness of thoughts and feelings which in after years are dimmed by the gathering clouds of care. Business-worry is incompatible with day-dreams, and an American humorist is perhaps right that "Socrates would not have stood twenty-four hours wrapt in metaphysical abstractions, if he had been bothered with poll-taxes, municipal taxes, water-bills, gas-bills and contributions to the campaign-fund of half a dozen party candidates."

Another cause of intellectual precocity is found in the susceptible nervous organizations of childhood. "Dans l'enfance," says Bichat. (*De la vie et de la mort*, Art. 8, 6,) "le système nerveux, comparé au musculaire, est proportionnellement plus considérable que dans tous les âges suivans, tandis que, par la suite, la plupart des autres systèmes prédominent sur celui-ci." Hence the apparent paradox that intelligence often seems to decrease with the advance from childhood to puberty. "The mental capacity of the orang and other apes," says Cuvier, "is developed at a surprisingly early period of life, but reaches an equally early climax, or rather a turning-point, since it undoubtedly subsides during the ascendancy of muscular force. The orang, in babyhood, astonishes every observer by its penetra-

tion, its cunning, and cleverness (son adresse), the adult orang is a stupid, brutal, and unmanageable beast."

The visitors of the Chimpanzee-house in the New York Central Park must have observed analogous facts; and those who deny a similar climax-period in the development of the human brain are apt to forget the difference between mental capacity and mental training. The high intelligence of the average Greek citizen in the age of Pericles would be rated still higher if we were to make allowance for the difference in the store of accumulated knowledge which our latter-day civilization has inherited as the bequest of every preceding age, and for similar reasons the intellectual capacities of childhood should be estimated in their relative, as well as in their direct, significance. A clever child in risking a controversy with a learned man has to contend with the same disadvantage that baffled the courage and strategy of the Circassian highlanders in their encounter with the rifle-armed Russians.

The receptive faculties of childhood manifest themselves in the rapidity of comprehension (greater aptitude in the acquisition of new languages, new doctrines, and arts), as well as in the fact that the mental tendencies of after years can generally be traced to the impressions of early youth. "The experiences of childhood," says Arthur Schopenhauer, "become, as it were, the types of our subsequent intellectual perceptions,—the categorical ideas under which we arrange our stores of theories and facts. Life amplifies, or slightly modifies, but almost never reverses, the verdict of dawning reason. In youth intelligence preponderates over the activities of volition. Hence, the bright, contemplative geniality in the expression of many young children—an expression so happily reproduced in the cherub-types of Guido and Raphael. * * * That plastic sensitiveness of the infant mind also explains the deep impressions left by the experiences of early childhood."

It has often been remarked that our impression on the first meeting with a new acquaintance is apt to be essentially correct, and the unbiased mental vision of childhood may for similar reasons be relied upon to arrive at conclusions more loyal to fact than the inferences of blue-spectacled erudition. In the light of that truth it is a significant circumstance that the philosophy of childhood is the extreme antithesis of monkish pessimism, and of the world-despising resignation which masks its turpitude with the appearance of saintly disinterestedness. Children are instinctive optimists. Their clearer vision recognizes health and happiness as the normal condition, disease and misery as abnormal discords, in the harmony of the universe, and their cheerful courage shames the sophistry of the whining world-renouncer who ascribes the results of his own decrepitude to the worthlessness of temporal existence.

That optimism is, however, compatible with a deep sympathy and an almost participative commiseration of real misfortune, and even with a keen appreciation of the charms of tragic poetry. It is a strange fact that the life-loving Greeks were passionate worshippers of the tragic muse, while our canting pessimism seeks diversion in farces and burlesques; but a precisely analogous phenomenon is the elegiac tendency of gifted boys, who in after years may prefer the banter of Anacreon to the grandest pathos of Sophocles and Euripides. Byron in his boyhood often passed whole weeks in the solitude of the Scotch highland, "musing and brooding," as his biographer expresses it, or wandered about the waste fields of Newstead Abbey, misanthropy in his heart and a copy of Ossian in his coat-pocket. Twenty years after, his friend Trelawney found him playing billiards and bandying bonmots with the gaiety of a French dandy.

"'Now confess,' he said, 'you expected to find me a 'Timon of Athens,' or a 'Timur the Tartar,' and are you not mystified at finding me what I am—a man of the world—laughing at all things mundane?' Then he muttered, as to himself,—

'The world is a bundle of hay,
Mankind are the asses who pull.'

"His conversation was anything but literary, except when Shelley was with him. The character he most frequently appeared in, was of the free-and-easy sort and his talk was seasoned with anecdotes of the great actors on and off the stage, boxers, gamblers, duellists, etc., appropriately garnished with the slang and banter of the day."

Childe Harold had become a Don Juan; though the friends who knew him best hinted that his hidden melancholy had continued to grow deeper and that his ostentatious mirth was akin to the grim humor of despair, like that of Vanini, whose black locks turned white in the dungeon of the Inquisition, but who cast laments to the winds when he learned that petitions would be in vain, anyhow, and that the tribunal of Toulouse had already purchased the pitch and pine-wood for his stake. A radical change in the humor, if not in the philosophy, of the great British poet, is, however, indicated by the altered tone of his letters and dramas; he evidently had begun to seek in satire the consolation which he once sought in elegies.

The literary tendency of the poet-philosophers Voltaire and Goethe underwent an analogous change: the recluse of Ferney indulged in ditties and burlesques, and the man whose youth had voiced its musings in Werther, cheered his old age in the rose-garden of Hafiz. The chief secret of such apparent anomalies is perhaps the charm of contrast, though misanthropists are apt to explain them on a theory of their own. "The chief drawback to the happiness of

youth," says Leopardi, "is dependence, while independence and definite escape from the shams and the meanness of society often cheer the gloom of old age."

"Men of genius," says Schopenhauer, "in youth often suffer from a feeling of solitude, and in after years, on the contrary, enjoy the consciousness of emancipation. The former feeling is founded on inexperience in the real character of our esteemed fellow-men, the second on the lessons of closer acquaintance. As a consequence, the second half of life, like the second part of a musical period, inspires less vague longings but more restfulness. * * * The sorrow of youth consists mainly in unsatisfied yearnings for an unattainable ideal of happiness, the sorrow of riper age in a dread of probable—but possibly avoidable—misfortunes. Freedom from positive trouble at last becomes the sole desire of a storm-tossed navigator of life's treacherous sea, whose perils enable him to enjoy the peace even of a humble harbor."

In the experience of a normally organized human being the period of love is preceded by a period of friendships—the earliest manifestation of that altruism which, next to constructiveness, has perhaps done most to insure the victory of our species over all varieties of our physically superior fellow creatures. Dogs, horses, and elephants, with all their affection for their helpless young, will see a distressed brother succumb to odds without as much as an audible symptom of concern. Wolves will often attack and rend a wounded comrade, while even the lowest species of our Darwinian kinsmen, the flat-nosed Brazilian capuchins, are thrown in the wildest excitement by the sight of a fellow-monkey's peril. At the alarm-cry of a wounded baboon all the members of his tribe, and often all the neighboring tribes of the four-handed commonwealth, will rush in, regardless of consequences, and in a contest with a well-armed hunter may thus frequently sacrifice their own lives without being able to avert the fate of their imperiled relative. But in a state of nature that brother-love has undoubtedly a tendency to promote the welfare of the species, and long before the dawn of religious altruism the co-operation of mutual friends may have insured the survival of our semi-human ancestors.

BOOK REVIEWS.

LOOKING BACKWARD.*

It is the wrong title. It should not have been *Looking Backward*, but much rather *Looking Forward!* For the book is really a look forward into a world as yet unseen and unknown, a future dreamland like Thomas More's Utopia which, nearly four hundred years ago, pictured a state in which, as in Bellamy's future society, every man is employed in some useful labor but no longer than

six hours daily; and all have equal incomes and are content to be able to satisfy their daily wants; and where both indolence and covetousness are unknown. The age of steam and electricity would naturally cause the author of "Looking Backward" to expect and promise a little more than the scant satisfaction of the necessities of life for the members of his new society, and to picture a condition of splendor and luxury in the public life of the future to which a parallel does not exist in this age of ours. There are in Bellamy's dreamland the greatest variety and plenty of entertainments and enjoyments of life, of social intercourse, traveling, the most elaborate means of education, of intellectual treats with lectures, sermons, newspapers, and libraries accessible to all equally, with musical and theatrical entertainments and, of course, all kinds of parties and hops open to every inhabitant of the land alike. Nevertheless, in all the throng, you do not meet the coarse and ignorant, the filthy and repulsive, because universal and compulsory education has done away with all coarseness and ignorance; and universal and uniform wealth has removed filth and offense of every kind. It is the millennium which the author describes, the "heaven on earth" which philosophy and prophesy have been looking forward to ever since man made his appearance on earth. The book is most emphatically a "looking forward," a look into a future of mankind as desirable as it has hitherto been pronounced inaccessible and impossible by all the wise men of the present age who make bold to thoroughly comprehend the nature of man, with his capabilities, his chances of development, and all the possibilities of the evolution of the race in times to come.

Bellamy's story tells us that Julian West, its hero, in 1887, when thirty years of age, was put into a trance sleep by a mesmerist who failed to recall him to life. In that trance he lay in a subterranean chamber until, one hundred and thirteen years, three months, and eleven days later, he was resuscitated from his lengthy sleep by Dr. Leete, a retired physician in New Boston, A. D., 2000. The doctor begins almost immediately to give to West an outline of the changes the city of Boston and the country at large have undergone during that long sleep. The nation had gradually succeeded in making the government absorb all the private business establishments, one after another, until the nation, or society, had finished by being the sole, or exclusive, proprietor of all means of production and distribution. That change accomplished, the state of society in 2000 is as follows:

The producers are the whole people, every citizen being obliged to labor. The nation is organized as an industrial army composed of grades, guilds, divisions, and departments, and commanded by officers, generals, etc., similar to the groups, and trade-unions of the socialists. Every citizen is, in 2000, attending public school until he is twenty-one years old. At that age he enters the first grade of the industrial army to serve three years as a common laborer. At the end of that time he may select a trade and enter an apprenticeship lasting one year. Or he may enter an industrial school if his talents are found to warrant such a step. The entire period of service in the industrial army extends to the forty-fifth year of life after which time the worker is pensioned and may spend the rest of his days as he likes.

According to the scheme of distribution, the shares of all citizens are alike, that is, each individual's share of the production of the nation is equal in amount to that of every other individual. As a set-off to this equality of distribution, society requires "precisely the same measure of productive service" from every man

in the discussion of social questions now before the public. The Nationalist clubs which are rapidly spreading throughout the land, make the fanciful description of the new society contained in the book the foundation of their agitation. For such reasons it seems desirable that people should read the book and get acquainted with its principles. That is why a fuller notice of it is considered acceptable to such readers as are interested in the progress of social thought.

* 2000-1887. By Edward Bellamy. Boston: Houghton, Mifflin & Co.

The book was noticed in a previous issue of THE OPEN COURT. But it is increasing in popularity and seems destined to achieve a deal of importance

which means that each is required to "make the same effort, that is the best service in his power to give." All men who do their best, do equal service. For this reason there is an "invalid corps provided with light tasks fitted to their strength," every one of which is entitled to and receives a share of the production equal in amount to that of every other citizen. So, there is no room for charity.

Of the special advantages the scheme enumerates as prevalent in the new society of A. D. 2000, may be mentioned: the absence of crime, of law, and legislation and, consequently, of lawyers. There are, further, no more politicians. But the author holds tight to the physician's and the churches with preachers and sermons. Yet nobody need go to church: a touch upon the knob of a domestic telephone on Sunday morning will make the preacher's sermon audible in the family residence. And if you want to hear a concert, touch your telephone knob, and sit down in your rocking chair, and your room will resound with the choicest music.

To the inner life of woman in the society of A. D. 2000, the author devotes some of his best thoughts. He may be criticized for assuming "that the vacuum left in the minds of men and women by the absence of care for one's livelihood, has been entirely taken up by the tender passion," but he pictures a desirable ideal condition of society by saying that "there can be no marriage except those of inclination," and that the woman of the new age has "risen to the full height of her responsibility as the warden of the world to come, to whose keeping the keys of the future are confided. Her feeling of duty in this respect amounts to a sense of religious consecration." And further the author says the rule of marriage from love only "means that for the first time in human history the principle of sexual selection, with its tendency to preserve and transmit the better types of the race, and let the inferior type drop out, has unhindered operation *** Every generation is sifted through a little finer mesh than the last. The attributes that human nature admires, are preserved, those that rebel it, are left behind."

Space forbids to go deeper into the details of the attractive picture. Otherwise, mention might be made of how the author places the burden of the support of children upon the nation and, at the same time, preserves the integrity of the family; how he suggests a system of awards for public services free from the sordid lust of riches and personal aggrandizement, and how he imagines a satisfactory domestic economy without the necessity of menial service. The reader will find many more elevating ideas in the book a perusal of which will be found instructive as regards the change of society contemplated by the socialist thinkers of the day. Nevertheless, as to the feasibility of the scheme set forth with all the arts of the imaginative novelist, doubts and objections are in order, as the reader may find out by himself. A. H.

The *Art Amateur* for June has no very long articles, but a great variety of technical articles and notices of exhibitions.

Montezuma's note-book contains a great deal about what might be called the commercial side of art; and if "the pleasure is as great in being cheated, as to cheat," pictures must give a great deal of pleasure to both parties if we trust his stories. In fact, a picture should be so truly ours that it is inestimable, or it is hardly worth the having.

We are glad to learn that the Prize Fund Exhibition gives evidence of originality of thought and nationality of feeling among American artists. We are also pleased to hear of a really good ideal statue, *Resignation*, by Mr. Keyser, for the tomb of ex-President Arthur. The design is a standing female figure.

A favorable notice is given of a pastel exhibition. This style of art is very graceful and pleasing, but we fear it encourages that tendency to sketchy work too common among our painters and cultivates a taste for the merely pretty that does not lead to real progress.

One of the best articles is on *Miniatures*, and as it is numbered one we trust there are others equally good to follow. This charming style of portrait is now reviving among us and work that Holbein thought not unworthy of him, need not belittle any one. Another article treats of marine painting in water colors. The continuation of the article on pen drawing gives more technical directions than the first number, but the illustrations are less pleasing. An article on amateur photography and many designs for furniture and fancy with the usual correspondence complete the contents of this valuable number. E. D. C.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXVII. — Continued.

The Sovereign turned to the Lord High Steward.

"I am surprised to find your Excellency here," he said; "I did not know that you too had taken leave of absence for this quiet life."

"My gracious master would have been surprised if I had not done my duty. It was my intention to have reported to your Highness to-day at the palace concerning the health of the Princess."

"So it was for that," said the Sovereign. "I had forgotten that my Lord High Steward is never weary of his office of guardian."

"An office that one has exercised almost half a century in the service of the illustrious family becomes in fact a habit," replied the High Steward. "Your Highness has heretofore judged with kind consideration the zeal of a servant who is anxious to make himself useful."

The Sovereign turned to the Marshal, and asked, in a suppressed voice:

"Will he remain?"

The Marshal replied, distressed:

"I could obtain no promise, nor even a wish from him."

"I knew it already," replied the Sovereign, hoarsely. He turned to the Professor, and violently forced himself to assume a friendly demeanor, as he said: "I have heard from my daughter of your campaign against broken chairs. I wish to have some talk with you alone about it."

They sat down to table. The Sovereign gazed vacantly before him, and drank several glasses of wine; the Princess also sat silent, the conversation flagged, the High Steward alone became talkative. He asked about a bust of Winkelmänn, and spoke of the lively interest which the nation took in the fate of their intellectual leaders.

"It must be an agreeable feeling," he said, politely, to the Professor, "to be in a certain measure under the protection of the whole civilized world. In the majority of cases the private life of our great men of learning passes away uneventfully, but our

* Translation copyrighted.

people delight in occupying themselves with the course of life of those who have departed. If happy accident brings a person into contact with gentlemen of your standing, he must take care that he does not suffer for all eternity under the hands of later biographers. I confess," he continued, laughing, "that a fear on this point has robbed me of many interesting acquaintances."

The Professor answered, quietly:

"The people are conscious that they have by the labor of scholars first been raised from misery; but with greater experience in political life, their interest in the promoters of our present culture will assume more moderate proportions."

"I have told the Sovereign that you have found something here," remarked the Princess, across the table.

"There has been a remarkable discovery made in an ancient sepulchre," interrupted the High Steward; and he gave a diffuse account of a funeral urn.

But now the Sovereign himself turned to the Scholar.

"Surely you may hope to find the rest?"

"Unfortunately, I do not know where to search further," replied the Professor.

"What you have found, then," continued the Sovereign, with self-control, "is unimportant."

It did not please the Professor that the conversation should again turn upon the manuscript; he felt annoyed at having to talk about his Romans.

"It is a few chapters from the sixth book of the Annals," he replied, with reserve.

"When your Highness was at Pompeii," interposed the High Steward, "the inscriptions on the walls attracted your attention. In those days a beautiful treatise upon the subject came into my hands; it is fascinating to observe the lively people of lower Italy in the unrestrained expression of their love and their hatred. One feels oneself transplanted as vividly into the old time by the naïve utterances of the common people, as if one took a newspaper in one's hand that had been written centuries ago. If any one had told the citizens of Pompeii that at the end of eighteen centuries it would be known who they, in accidental ill-humor, had treated with hostility, they would hardly have believed it. We indeed are more cautious."

"That was the hatred of insignificant people," replied the Sovereign, absently. "Tacitus knew nothing of that, he only concerned himself about the scandal of the court. Probably he also held office."

The Princess looked uneasily at the Sovereign.

"Is there anything in the contents of the parchment leaves which would be interesting to us ladies?" she said, endeavoring to turn the conversation.

"Nothing new," replied the Scholar. "As I had

the honor of telling your Highness, the same passage was already known to us from an Italian manuscript: it is about small events in the Roman senate."

"Quarrels of the assembled fathers," interposed the Sovereign, carelessly. "They were miserable slaves. Is that all?"

"At the end, there is another anecdote of the last years of Tiberius. The disturbed mind of the prince clung to astrology: he called astrologers to him to Capri, and caused those to be cast into the sea whom he suspected of deceit. Even the prudent Trasylus was taken to him over the fatal rock path, and he announced the concealed secret of the Imperial life. Then the Emperor furtively asked of him whether he knew what would happen to himself that day? The philosopher inquired of the stars, and called out, trembling: 'My situation is critical; I see myself in danger of death.' At this passage our fragment breaks off. The incident may have been repeated—the same anecdote attaches to more than one princely life."

A couple of daws flew round the battlements of the tower, they cawed and screamed, and told one another that underneath there stood a sportsman who was seeking his game. The Sovereign suddenly arose.

"There must be an end to the screaming of these birds."

He beckoned to the forester. The man approached, and placed a weapon in his hands. The Sovereign placed the but-end on the ground and turned to the Professor, while the Princess, disquieted by the last words of the Scholar, stood aside with her suite, struggling for composure.

"The Princess has told me," began the Sovereign, "that you have some hesitation as to fulfilling a wish that we have all much at heart. I hope that the hindrances may not be insurmountable."

"It becomes me," replied the Professor, delighted by the kind words of the Sovereign, "to weigh calmly so honorable a proposal. But I have other things to take into account besides the cause of learning."

"What others?" asked the Sovereign.

"The wish of a loved wife," said the Professor. A sudden convulsion shook the limbs of the Sovereign.

"And how do you consider your relations to me?" asked the Sovereign, in a hoarse voice.

The Scholar looked at the man, from whose eyes darted a look of deadly hatred and malignity. He saw the muzzle of the weapon directed toward his breast, and the raised foot of the Sovereign feeling for the trigger. The flash of lightning impended, there was no room for flight, no time for movement; the thought of the last moment passed through his mind. He saw before him the distorted countenance of the Emperor Tiberius, and he said, in a low voice:

"I stand on the verge of death."

"The Sovereign is sinking," called out the High Steward.

He threw himself with outstretched arms towards his master, and seized his hands. The Sovereign tottered, the weapon fell to the ground, he himself was received in the arms of those who hastened toward him. The Princess flew up to them, and looked inquiringly into the pale face of the Scholar.

"The Sovereign has been attacked by a sudden dizziness," answered the latter calmly.

"My master is losing consciousness," cried the High Steward. "How are you, Mr. Werner?"

The hands of the old man trembled.

The Sovereign lay senseless in the arms of his attendants, and was carried to the castle.

The by-standers expressed with much concern their terror at the event and the Princess hastened after the stricken Sovereign. Before the High Steward followed, he said to the Professor, whilst giving him a searching look :

"It is not the first time that the Sovereign has been taken ill in such a manner. Was that a surprise to you? You did not know that the Sovereign was suffering in this way?"

"I know it to-day," replied the Scholar, coldly.

A few minutes afterwards the High Steward entered the room of the Professor, who was preparing for his journey.

"I come to beg your indulgence," began the High Steward ; "for I must trouble you with an acknowledgment which is painful to me. You have talked much lately in my presence to the Sovereign of the Cæsarian madness of the Roman emperors. What you then said was very instructive to me."

"I now find," replied the Professor, gloomily, "that the place was ill chosen."

"More than you assume," replied the courtier, drily. "To me it was peculiarly instructive, but not so much what you said as that you said it. I should not have thought it possible that any one would so acutely reason upon the past, and so completely give up all judgment of that which was around him. You then told a sick man the story of his own disease."

"I have just discovered that," replied the Scholar.

"The Sovereign is diseased in mind. It is now necessary that you should know it. I have a second confession to make to you. I discover that I have misjudged you."

"I shall be glad if your present opinion is more favorable to me than the former one," replied the Professor, with dignity.

"In your point of view, yes," continued the High Steward. "I have for a long time regarded you in your relations here as a cautious man, who was clev-

erly following out his objects. I have learnt that you are not that, but something different."

"An honorable man, your Excellency," replied the Professor.

"We have nothing to reproach one another with," rejoined the courtier, bowing ; "as you misjudged the Sovereign, so did I misunderstand you ; but my mistake is the greater, for I am an older man, and I have not the excuse of a specially intellectual mind, which sometimes makes it difficult for a man to judge correctly of other natures. But we have both one excuse. It is seldom easy to form a just estimate of those who have grown up in other circles, and show a different combination of virtues and weaknesses. We are all liable to be confused in our judgment, according as our self-respect is satisfied or wounded. Where genial tendencies find no response, displeasure erects a barrier ; and where powerful tones echo sympathetically to one's breast, there is the danger of too rapid intimacy. Thus I have put too low a value on your honorable openness and candor. I now pay the penalty, for I have to confide to you a secret that I have no doubt you will accept with proper regard."

"I assume that your Excellency does not make this communication to me without a specific cause."

"There is a plan for keeping you in our city," interposed the High Steward.

"Proposals of this nature have been made to me since yesterday."

The High Steward continued : "It is not necessary for me to be anxious about your answer. You have learnt the meaning which is concealed under a veil of civility. Do you know why the Sovereign made you the proposal?"

"No ; up to this morning I have not doubted that a certain personal feeling of kindness, and the view that I might be useful here, were the motives."

"You are mistaken," replied the High Steward. "It is not a wish to keep you here merely for passing private interests. The real motive is, as appears to me, the freak of a diseased mind, which sees in you an opponent, and fears a sharp-sightedness that will remorselessly disclose to the world a diseased spirit. You were to be fettered here ; you were to be cajoled, watched, and persecuted. You are an object of interest, of fear, and of aversion."

The Professor rose.

"What I have experienced and what you tell me compel me to leave this place instantly."

"I do not wish," said the High Steward, "that you shall depart from here with displeasure, if this can be avoided ; both on your own account and for the sake of many of us."

The Professor went to the table, on which lay the parchment leaves.

"I beg your indulgence if I do not regain my composure immediately. The situation in which we are placed is like that of a distant century; it stands in fearful contrast to the cheerful security with which we are wont to consider our own lives and the souls of our contemporaries."

"Cheerful security?" asked the High Steward, sorrowfully. "In courts, at least, you must not seek this, nor under any circumstances in which the individual passes out of private life. Cheerful security! I must ask whether we have it in this century? It would be difficult to find a time in which there is so much that is insecure; in which the old is so decayed, and the new so weak."

The Professor raised his head, astonished at the bitter complaints of the old man. The High Steward continued, indignantly:

"I hear everywhere of the hopes that one has in the nation, and I see an abundance of young student-like confidence. There is not much mature power, and I do not blame a sanguine man if he places his hopes on it; nay, I even admit that this youthful spirit is in fact the best hope that we have. But I am an old man; I cannot among these novelties find anything that commands my respect, where they affect the interests of private life. I feel the decay of vital power in the air which surrounds me. My youth belonged to a time when the best culture of the nation was to be found at Court. My own ancestors have for six centuries taken an eager part in the follies and crimes, and also in the pride, of their times; and I have grown to be a man in the conception that princes and nobles were the born leaders of the nation. I see with sorrow that they have for long, perhaps for ever, lost this lead. Much of what you lately said exactly coincides with the last decades that I have passed through. It has been a sorrowful time; the hollow weakness in the life of the people has in a great measure deteriorated the higher classes. But there has not been altogether a deficiency of honorable and powerful men. What time has been entirely without them? But what should be the noblest blossom of the national strength is just what in this empty shallow time is most deeply diseased."

The Professor interposed:

"It is a cause for sorrow; but where, perhaps, the individual loses, the whole gains?"

"Undoubtedly not," replied the courtier; "if only the gain to the whole was certain. But I see with astonishment that the greatest concerns of the nation are carried on, on all sides, with school-boyish pettiness. Much that is valuable is lost; nothing better is gained. The delicacy of feeling which formerly expressed itself beneficially in all forms of intercourse, and the discreet management of important affairs, be-

come rare. If these advantages did not suffice to form the character, as is perhaps needed in the present, they made life pleasing and beautiful. A secure feeling of superiority, and a gracious rule over others, was general at courts and in business; of this we are deprived. Diplomacy has ceased to be distinguished. One sets bluntly to work; not only nobleness of feeling, but even the pleasing show of it is wanting; an uncertain pettiness, a grumbling, irritable, reserved character has gained the upper hand at courts, and in diplomacy ill-bred frivolity, without knowledge and without manly will. Our princes rattle about like accoutred idlers; the old court discipline is lost, and one feels oneself incessantly on the defensive, and seeks for safety in senseless attacks. It is impossible not to feel that by these acts one is irretrievably going downward."

The Professor smiled at the sorrow of the old lord.

"I do not blame you," continued the High Steward, "if you do not feel the misfortune of this change as deeply as I do. It is only a pity that it should always be the highest earthly interests which are thus trifled with."

"But is this misfortune so general?" replied the Professor.

"Some splendid exceptions have not been wanting," said the High Steward; "some were granted us at a time when we played the greatest tragedy before the world, as if here and there to preserve a bright romance. They have scarcely been wanting in a country which possesses the five qualities which are necessary to form a good court: an upright sovereign, an amiable princess, a high-minded statesman, some intellectual court ladies, and a superior spirit among the cavaliers. But these requisites are seldom found."

"Were they ever frequent?"

"They were the pride of our nation at the time from which my earliest recollections date," replied the High Steward.

"Just at this time we gained something else of which we may still be proud," rejoined the Scholar. "There was a short period during which the Court became the home of the most liberal culture of the time, and it was only through the rare political circumstances of our nation that this leadership was possible. Now it has passed into other circles, and we have exchanged the increased capacity of many for the distinguished culture of individuals."

(To be continued.)

Green be the turf above thee,
Friend of my better days;
None knew thee but to love thee,
Nor named thee but to praise.

—Ben Jonson.

GEMS FROM THE GERMAN.

TRANSLATED BY MARY MORGAN (GOWAN LEA).

IV.

[Adapted from an Old Song.]

Where is now my poet gone,
 Who upon the prairie
 Sat and sang to me alone—
 Me—his forest fairy?
 "Maiden, dost thou ask me why
 Godlike genius should die?"

V.

IN GERMANY'S BEAUTIFUL LAND.

In Germany's beautiful land,
 Full many a poet hath sung,
 The singers are dead in the sand,
 Their lyres are all broken, unstrung.
 But long as the stars shall go round,
 And illumine this dark earthly sphere;
 So long shall sweet voices be found,
 To charm us with poetry here.
 The homes of the heroes shall fall,
 In mouldering ruin lie low;
 But from the old mansion or hall,
 A lovely new Spring-tide shall go.

—Eichendorff.

VI.

MY WISH.

I often wish my life were free,
 That I from men might hie away,
 O'er rivers calm glide pleasantly,
 'Neath quiet skies of softest gray:

Where birds might flit about my feet,
 And worldly strife no more pursue;
 The elements to rock and greet
 Me, laving me in pearly dew:

Where, sailing close by pebbly beach
 (Without forsaking my light bark),
 The wild rose-bud I still could reach,—
 Then rove again, blythe as the lark.

The grazing herds on distant hills,
 The freshly springing flowers of May,
 The purpling grapes, the purling rills,
 The fragrance of the new-mown hay:—

All these I'd view in purest light—
 A ray that ever clearer seems;
 At Nature's fountains, cooling, bright,
 I'd quaff,—and dream but happy dreams.

—Von Platen.

CORRESPONDENCE.

THE IDEA OF GOD.

To the Editor of THE OPEN COURT:—

TO INQUIRE, in a spirit of truth, into the history of the different ideas of God, formed by different men, at different times, is surely worthy of the highest powers of man's intellect. But you will kindly allow me to say, with sincere respect, that our idea of God is one thing, God Himself is quite another. Granted, that our ideas are concrete and abstract, universal, particular, tran-

scendental, adequate or inadequate, etc., we cannot possibly have an adequate idea of God in the sense of comprehension, for an adequate idea "includes not only all that is of the essence, but all accidents and relations of its object." We can never in this world or the next comprehend God. For He is infinite, we are finite.

Moreover, it is not surely a legitimate argument to say that different men at different times have had ridiculous, grotesque, manifestly absurd ideas of God, therefore there is no God, Creator and Ruler of the Universe who will reward or punish.

Again the argument of modern men of science is surely not legitimate since they can present no more than a comparatively scanty knowledge of the component parts in nature, and of the action of the parts separately and collectively. Such is astronomy, such biology, such geology, and so on.

The parts, and the action of the parts, in nature, is one thing: the origin or first cause of nature is quite another.

Back of the origin of species by natural selection, is the origin and nature of life.

It will not do for them to argue with intelligent men, saying, we know the parts and the action of which nature is made up, therefore it is *not made* by God.

MICHAEL CORCORAN.

LINCOLN, NEB.

[The remarks of Mr. Corcoran were suggested by a "careful reading" of the pamphlet "The Idea of God" and various editorial articles in the columns of THE OPEN COURT. A reference to the essay "Phenomena and Noumena," No. 82, will sufficiently explain the difficulty that "our idea of God is one thing, God Himself another." The nature of *comprehension* is discussed in "Is There Anything Unknowable in Causation," No. 59. The argument attacked in the second paragraph was never advanced by THE OPEN COURT.—Ed.]

NOTES.

Scribner's for July will contain a number of short and entertaining stories. The idea is to issue a "Fiction number for Midsummer reading."

M. Alfred Binet promises, before long, to contribute to our journal a series of papers on the Psychology of Unconsciousness. The articles will undoubtedly contain many new and important suggestions.

Prof. Holden's article in this month's *Himmel und Erde* is accompanied by beautiful photographic representations of the first and last quarters of the moon. The photographs were taken with the great telescope at the Lick Observatory.

Our correspondence relative to the Single-Tax question increases. The publication of the majority of the communications has necessarily been delayed. We promise our correspondents that extracts, at least, from those letters will be published that touch upon points not already discussed.

In Mr. Paul Shipman's article, "Of Christianity and Agnosticism," published in our last issue, the following typographical errors are to be corrected. Page 1667, first column, fourth line, read *transformations* instead of *confirmations*; fourteenth line, *ibid.*, *attitude* instead of *attribute*; and p. 1668, first column, last line, *in favor of* instead *in form of*.

The New Review, the first number of which is now out, seems destined to eclipse many a more pretentious contemporary. Its merits are brevity and cheapness; it contains ninety-six pages of printed matter and costs but 15 cents a copy (\$1.75 a year). The contributors are prominent publicists, and the subjects of vital interest in politics, science, and art. It is a magazine of the highest order and within the reach of all. (Editor, Mr. Archibald Grove; publishers, Longmans, Green & Co., London and New York.)

NEW PUBLICATION.

THE

Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the Sanction of
the Author. Treating of the following subjects

1. The Psychology of the Cell—Introductory.
2. The Structural and Physiological Character of
Proto-Organisms: the Motory and Sensory Organs.
3. The Psychology of Nutrition: Holophytic, Sap-
rophytic, and Animal Nutrition: Predatory Habits
of Certain Animalcula.
4. Colonies of Unicellular Organisms.
5. Fecondation of Proto-Organisms.
6. Fecondation of Higher Animals and Plants.
7. The Physiological Function of the Nucleus.
8. Correspondence between Alfred Binet and Ch.
Richey (Professor of Physiology in the Faculty of
Medicine at Paris) respecting Cellular Psychology.

The monograph of M. Binet is an important con-
tribution to comparative psychology. It presents
the results of the most recent researches, and draws
from sources inaccessible to the majority of scien-
tific readers—the reports and publications of for-
eign societies. Here may be instance, apart from
the author's original investigations, the researches
of Balbiani, Claparède and Lachmann, Maupas,
Ribot, Haeckel, Engelmann, Espinas, Pouchet, We-
ber, Pfeffer, Kent, Dujardin, Gruber, Nussbaum,
Butschli, Lieberkühn.

In a preface written especially for the American
edition, M. Binet concludes the theory of the English
scientist, Dr. C. J. Romanes, that the first appear-
ance of the various psychical and intellectual facul-
ties is assignable to different stages in the scale
of zoological development.

16 mo, 135 pages. Cloth, 75 Cts., Paper, 50 Cts.

DEFINITIONS EXPLANATORY OF THE POSITION OF
"THE OPEN COURT."

THE DATA of experience are perceptions.

REALITY is the sum total of all that is.

TRUTH is the conformity of cognition to reality.

[Truth being a relation between subject and object appears to be relative in its nature. Absolute truth is a self-contradiction; it would imply cognition without a cognizing subject.]

At the same time it is obvious that absolute existence (in fact everything absolute) is impossible. Reality is properly called *Wirklichkeit* in German, derived from *wirken*, to take effect. Reality is not immovable and unchangeable absoluteness, but the effectiveness of things in their relations. Reality therefore implies not only existence, but the manifestation of existence also. Existence and its manifestation are not two different things; both are one.

The idea of something absolutely Unknowable is therefore also untenable; it would imply the existence of an object whose existence is not manifested *i. e.*, existence without reality; *Sein ohne Wirklichkeit*—which is a contradiction, an impossibility.]

SCIENCE is the search for truth.

The nature of science is the economy of thought. (*Mach*.)

Economy of thought is possible through application of the laws of form to thought.

KNOWLEDGE is the possession of certain truths.

[Knowledge is, so to say, the present stock or capital with which Science works. Science cannot exist without knowledge. The object of Science is not only to increase and enlarge knowledge but also to purify the present stock of knowledge from vagueness, errors, and misconceptions.]

The purpose of knowledge is that of increasing our power over nature.]

MONISM is that philosophy which recognizes the oneness of All-existence, and the Religion of Monism teaches that the individual, as a part of the whole, has to conform to the cosmical laws of the All.

RELIGION is man's aspiration to be in harmony with the All.

[Religion has been defined differently in the columns of THE OPEN COURT, but all definitions that have been presented are in strict agreement. Mr. Hegeler in No. 25, defines Religion as "man's union with the All" (taking the definition from the Lutheran Catechism "Religion ist der Bund des Menschen mit Gott durch Gott," and replacing the Word GOD by the more comprehensive word THE ALL). The editor has defined Religion as "man's consciousness of his relation to the All" (No. 24); as "Das Allgefühl im Einzelnen," the All-feeling in the individual (see

foot-note page 965); as "man's conception of the world that serves him as a guiding-star through life" (page 1180).]

MORALS are man's conduct in so far as it is in unison with the All.

[The basis of morality is religion. A moral educator or preacher may justly be asked, "On what authority dost thou justify thy precepts?" And he will tell us that his authority is not personal; he speaks in the name of universal order. Accordingly his authority is that of religion. If it were not so, all his good precepts would have no foundation; they would hover in the air like beautiful dreams that have no reality.]

ETHICS is the Science of Morals; it teaches man why he must, and how he can, regulate his conduct so as to be in unison with the All.

Natural history and the history of mankind prove that here on earth a constant progress takes place developing ever higher forms of existence.

Morally good are those acts which are in harmony with the All, *i. e.*, those which enhance progress, and *morally bad* are those which are not in harmony with the All, *i. e.*, those which retard or prevent progress.

[Religion (man's aspiration to be in unison with the All) has naturally produced many superstitious notions in the world, of its origin, and of its purpose. Similarly, science (man's search for truth) has produced many errors or false notions of reality. But all the superstitions of religion do not prove that religion as such is an illusion, and all the errors of science are no evidence that science as such is a sham.]

It is obvious that religion and science, as here defined, are not contradictory to, but complementary of, each other. If religion and science do not agree, it is a certain sign that our conception of either the one or the other is wrong. The history of the human mind has been one of constant conflict and reconciliation between religion and science. Their relation has repeatedly been disturbed and re-adjusted.

The unitary conception of the world affords the only basis for the union of Religion and Science, and opens a new vista of progress for both.]

RECENT CONTENTS OF "THE OPEN COURT."

THE RISE OF THE PEOPLE OF ISRAEL.

[A masterly sketch of the history of Israel's people in the epoch of national organization; marked by critical acumen and a love of truth. The author, PROF. CARL HEINRICH CORNILL, is an orthodox theologian, of Königsberg, Germany. (Nos. 90, 91, 92.)]

THE SITAHARANAM; OR, THE RAPE OF SITA.

[A charming tale of ancient Hindu life; a typical selection from Sanskrit literature. Translated from the original text by PROF. ALBERT H. GUNLOSSEN. (Nos. 90, et seqq.)]

THE TRANSIENT AND THE PERMANENT IN THEODORE PARKER.

[A Discourse held at the dissolution of Parker's society, by MONCURE D. CONWAY. Interesting personal reminiscences, historical, literary, educational. (Nos. 91, 93, 94.)]

THE PHYSICAL BASES OF PERSONALITY.

[The second of a series of essays by the eminent French psychologist, TH. RIBOT. Translated with his consent from the "Diseases of Personality." An important contribution to modern psychology. (No. 93.)]

THE WORKINGMAN'S DOLLAR.

[By WHEELBARROW. A sound discussion of an economical question now engaging the attention of all. (No. 93.)]

THE ELECTRICAL EXPERIMENTS OF PROF. HERTZ.

[The electrical researches of Prof. Hertz, of Karlsruhe, form one of the most important contributions to modern science. They show that electricity acts in the same way and according to the same laws as light and radiant heat. (No. 95; to be continued in No. 97.)]

AGNOSTICISM AND THE THEORY OF LIFE.

BY M. C. O'BYRNE.

THE adequacy, or rather efficacy, of philosophy in reconciling the mind to the prospect of approaching death is only called in question by those whose judicial qualifications are restricted either by a comparatively weak and defective natural intelligence or by narrowness of education, or by both. There is, I believe, a hymn very popular among certain denominations of Protestants, one verse of which affirms that

"Jesus can make a dying bed
Feel soft as downy pillows are."

Only those who have witnessed the dissolution of some faithful Christian can understand how absolutely the mind may, in that supreme moment, be so filled with hope, that the throes of the great agony may go almost unheeded. This condition at the last moment of life cannot be properly termed one of ecstasy, inasmuch as that would imply (*ἐξίστημι*) not merely exaltation, but displacement or subversion of the intellectual faculties, and because we know from actual observation that persons animated by this confident expectation have maintained to the last great tranquillity of mind and manifested unimpaired faculties.

Only that which, for want of a better term, we must call anti-Christian fanaticism would venture to deny that religion is thus able to supply what Steele, in one of his letters to Pope, called "a cheerful dying spirit," the spirit so gloriously represented in the final stanza of the great ode of the eighteenth century Maker:

"The world recedes; it disappears!
Heaven opens on my eyes! my ears
With sounds seraphic ring:
Lend, lend your wings! I mount! I fly!
O grave, where is thy victory?
O death, where is thy sting?"

Surely there is nothing to be gained from the refusal to acknowledge that religion is potential in assuring to those who have, like the apostle Paul, "kept the faith" and "fought a good fight" that which Cicero termed the *clara mors*, a bright, a lustrous death? Where the belief has been honest, the conviction unshaken, there of necessity has the life been accordant therewith, so that, save in the improbable case of an absolute phrontistic metamorphosis at the last moment, we ought logically to expect that the last act of faith would take the form of an assured conviction like that of Paul: "Henceforth there is laid up for me

a crown of righteousness, which the Lord, the righteous judge, shall give me at that day."

With all due respect to the now fashionable Agnosticism,—which, however, I can hardly avoid considering as, at least in some cases, a convenient refuge for those who are "too weak to bear the insupportable fatigue of thought,"—I must confess that this Christian certainty, however "astonishing" the creed upon which it is founded may appear to the couched eye of reason, seems to me to be infinitely preferable to the absolute uncertainty which sees no absolute, and which refuses,—as I understand it—"to choose between materialism and idealism"* or to accept the autocentric thesis of the Hylö Idealist which reconciles and incorporates these otherwise incompatible assumptions. Of a similar opinion in this regard is the parent of the term Agnostic who,—whatever the case may be with the ever-increasing multitude that now shelters itself beneath the title as though it were a fixed and final barrier to ontological speculations,—has recently declared that he is "much disposed to think that the encouragement, the consolation, and the peace afforded to earnest believers in even the worst forms of Christianity are of great practical advantage to them."†

This is unquestionably a remarkable concession, even when followed by an allusion to certain deductions which "must be made from this gain on the score of the harm done to the citizen," etc.; because there are many who will maintain, on purely utilitarian grounds, that a theory of life which, on the testimony of those by whom it is repudiated, can in the hour of trial afford encouragement, yield consolation, and provide ultimate peace must assuredly preponderate when thrown into the balances against those evils whose injurious influence it can thus modify and reduce.

No less evident is it, in my opinion, that Christianity as "a religious philosophy" will always appear superior to M. Comte's Positivism, at least so long as the latter fails to convince mankind that in and by means of its seven fundamental sciences all those emotions and promptings of the human mind which have hitherto found expression in supernatural religions and metaphysical systems can be satisfied. Up to the present, science has, while dissipating the forms of

* Professor Huxley, "Science and Morals: a Reply."

† "Agnosticism," Prof. Huxley in *Nineteenth Century*.

old beliefs and rendering negation with respect to them not merely possible but necessary, by no means and in no degree superseded religion itself. Indeed, as Mr. Spencer so clearly shows, it has rather enlarged "the sphere for religious sentiment" with every accession it has made to the sum of human knowledge, the widening of the field of vision having from the very beginning of science "been accompanied by an increasing capacity for wonder."* The mystery of the "Great Enigma" † not only transcends but it has swallowed and absorbed the many mysteries of older religious systems, so that the human mind stands awed and amazed in the presence of "an Infinite and Eternal Energy from which all things proceed." Recognizing such an Energy, it is scarcely possible for us to be content to stifle the instigations of our nature by consenting to term it the Unknowable and by dubbing ourselves Agnostics. We are, as Mr. Spencer allows, continually prompted to imagine some solution,—and prompted moreover by the intellect no less than by volition and feeling, since the incentive is distinctly said to attend upon or result from the analysis of knowledge. Instead, therefore, of liberating the world from theologism, Agnosticism has discovered a Deity whose overpowering vastness is not the less awe-inspiring because it may be expressed by a privative algebraic formula, a Deity already identified by some Christians with God "the mind and spirit of the universe," ‡ a Deity that may yet be worshipped as the Unknown God was adored by the Agnostics of Athens, § a Deity in whose pancratic attributes the "two or three" who "are gathered together to worship the Unknowable," profess "their unwearying belief," "even if no weak brother with ritualist tendencies" has yet been heard to cry, "'O x', love us, help us, make us one with thee!'" ||

With some such apparent perversity as we sometimes find displayed between brothers or other members of a family, the Agnostics and the Positivists are now somewhat estranged. Indeed, we may almost affirm that they are rivals in a race for public favor, the apostles of the Humanitarian Religion labelling Agnosticism the "temporary halting-place" of a-symmetric scientific men (the "Christian philosopher" calls them sciolists), while on the other hand those Agnostics who agree with Mr. Spencer that the religious consciousness is a sentiment that can never be lowered, have little or no respect for that retrogressive religion which adapts old machinery to new uses, and

which would claim for the part,—for that "whole of human beings" which Spencer declines to admit to godhood,—that "veneration and gratitude" which the Agnostics do not feel called upon to display toward the mysterious All in which all parts cohere.

Reverting, however, to the affirmation that philosophy is able to reconcile the mind to the prospect of imminent death, and to the implication that Christianity can only be suppressed by a theory of life capable of satisfying those emotions and promptings which have hitherto found expression and satisfaction in supernatural religions and ontological systems, we shall find that a philosophy based upon nescience, which, as it were, hangs its head, if it does not tremble, in the presence of an Unknowable Cause of things, can never do this.

Worse than all the gibing, threatening ghosts that haunted the dreams of Clarence in the Tower would be the dread suggestion of *perhaps* standing with uplifted finger at the bedside of one dying with apparently unimpaired mental faculties. At such a moment and under such conditions the memory is so active that De Quincey's identification of its extraordinary vigor of operation in the last extremity with the book of doom alluded to in the Bible is by no means overstrained or unjustifiable. "It has been," he wrote, "remarked, and I think justly, that the dread book of account which the Scriptures speak of, is in fact the mind itself of each individual; of this at least I feel assured, that there is no such thing as *forgetting* possible to the mind."**

The well known verses recited by the Emperor Hadrian when dying are, I consider, quite as remarkable for the solicitude they manifest as they are for the apparent volatility which, by the use of so many caressing diminutives, doubtless effectually concealed the speaker's anxiety.

"*Animula, vagula, blandula,
Hospes comesque corporis,
Quo nunc abibis in loca?
Pallidula, rigida, nudula,
Nec, ut soles, dabis joca!*" †

Gibbon affirms of Hadrian that "the ruling passions of his soul were curiosity and vanity," and I fear that in this instance we must recognize little more than another example of the ruling passion strong in death. However capricious his ordinary nature, we must conclude that the man who thus interrogated his supposed vital principle respecting its destination was disturbed and perhaps alarmed by his inability to re-

** "Confessions of an English Opium Eater." Compare also Ribot's "Diseases of the Memory." The reader will, of course, see that the physiological explanation is here beside the question.

† "Dear little vagrant, charming spirit,

Guest and host of the body,

Whither now wilt thou depart?

Little pale, rigid, forlorn one.

No more, as thou wert wont, shalt thou bandy jests."

§ "I found an altar with this inscription, TO THE UNKNOWN GOD [Ἄγνωστο Θεῷ]. Whom therefore ye ignorantly worship," etc. Acts of the Ap., XVII. 23.

|| "The Ghost of Religion," by F. Harrison.

turn a satisfactory encouraging answer. This hypothesis of a vital principle, however irrational it may appear, is at any rate inexorably logical in its demands. Whether or not we regard it as a partial entity originally broken off from the Supreme Idea, the Real Existence, and suffering defluxion,* which is Platonism, it is self-moved and always moving; or as a self-moving monad passing through various imperfections and avatars toward its final blending or amalgamation with the Divine ethereal soul,—which is Pythagoreanism; or as the identity in conscious relation (*Idee*) of Being and Non-Being, Subject and Object,—which is Hegelianism; or as a living soul breathed into the organism by a personal Divinity, †—which is Christianity,—it is immortal. There ought to be no doubt in our minds on this subject, no pretentious relegation of it to the recesses where loud-mouthed Ignorance thrusts all that it cannot demonstrate to the senses, wrapped in the thin tissue of a flimsy rhetoric and labelled “*Of this we have and can have no knowledge.*” He who is able during his last hours to make and enjoy a *jeu d’esprit* upon Charon and the passage of the Hateful River ‡ must have his judgment securely anchored to the belief that the Plutonian shore with its vagrant ghosts was but a figment of the imagination, a conviction, doubtless, no less satisfactory than that of the philosophic Julian, who, dying in the arms of victory, looked forward with pleasure to his approaching union with the divine *αἰσῆσις* of the universe.

When we find that many of the greatest of our race have agreed that “whatsoever that is which thinks, which discerns, which wills, which flourishes, it is heavenly and divine, and must necessarily be everlasting,” § the plea of no knowledge is surely but a poor justification for systematically endeavoring to weaken the belief of the millions who find encouragement and a sure ground of hope in the doctrine of immortality.

Still more difficult must it be to make such a negative propaganda appear conformable to duty or propriety if it should prove that the proposed succedaneum consists mainly of a few general maxims derived principally from the old beliefs, but destitute of their authoritative basis and incentive. More even than this, the true philanthropist would probably hold that there could be no actual justification for interfering with this doctrine on the positive ground of the non-existence of a soul or vital principle if it were certain

or even probable that the sociological results of weakening or impairing the belief would be found otherwise than beneficial either by the individual or the community.

In that extraordinary compound of physiology, kinetics, and mysticism, Hinton’s “*Life in Nature,*” we are able to recognize the disquietude occasioned by the cogency of those demonstrations of material forces, powers, and laws, which have done so much toward the elimination of various long-cherished notions on the subject of eschatological causation,—of the ultimate energy operating throughout and behind all nature, like the artificer and controller of some cosmically-colossal Strassburg clock,—just as Lavoisier’s quantitative analysis annihilated Dr. Priestley’s interesting Principle of Levity, Phlogiston, almost before it had come within sight of its *ἡλυσία*, or prime of life.

Why so many specialists are thus disposed to vex themselves over the possible consequences of a general acceptance of generalizations based upon data furnished by their own researches, we need not now inquire. It may well be that we could present a reasonable explanation of this their apprehension, as we certainly could of the causes which induced the mathematician Cotes to fulminate against Materialism, taking his texts from Newton’s “*Principia,*” or of those which led their *facile princeps*, Michael Faraday, into the sloughs and quagmires of a drivelling Sandemanianism.

Mr. Hinton is a writer whose conceptive restrictions are rather one-sided, inasmuch as he manifests some fertility of imagination in the cause he has at heart,—namely, the substitution of one ideology for another. Arguing from the supposed or apparent deadness of inorganic matter, he concludes that man is spiritually the dearest thing in the universe, and he suggests that if we can only realize that all “partial life” is but seeming or phenomenal, we may be ultimately able to discover the “very Life,”—with a capital letter,—which is the universe, or in other words once and for all to solve Mr. Spencer’s great enigma. He says:

“In the view we thus take many advantages are found. Our thought of nature is at once simplified and elevated. Instead of feeling ourselves to be a fixed centre, before which a mechanical universe marches with dead footsteps, we rise to take conception of a larger and sublimer universe, of worthier ends and grander sweep, upon the very tide of which our little lives,—nay, man’s own larger life is borne; the true order and course of which includes the changing consciousness of man, painting so upon eternity for him a visionary time; which has for one of its least elements the pulsing of his heart and throbbing of his brain, which is enriched with all his passion, and bears his life-blood as a drop in its warm bosom; all being faintly imaged to his unperceiving eyes in changing garniture of earth and sky, from year to year.

“Thus we do not seek any longer to attach our marvellous consciousness to these passive things which seem, but cannot be, its

* Plato, “*Phædrus,*” where Socrates expounds the idea (*form, nature, figure*) of the soul. This defluxion or wing-drooping of the imperfect soul is followed by a junction with a terrene body, the result of the union being a mortal animal. The mythus is poetical, but no Sophist such as Gorgias, would term it, as does Lewes, the “poetry of philosophy.”

§ *Itaque quicquid est illud quod sentit, quod sapit, quod vult, quod viget, celeste et divinum est; ob eamque rem, æternum sit necesse est.*—Cicero.

causes. It has a worthier, a more reasonable source. These material things,—which are found to be mere 'phenomena,'—and their changes,—in which there is no change,—are not the causes of that which we experience; they are the appearances which a deeper cause, unseen, brings up before us. **

Much of this is so efflorescent in its verbiage that were Mr. Hinton an Agnostic, instead of being the apostle of a particular kind of esoteric *gnosis*, he might fairly dispute the bays with the proudest peripatetic professor of rhetorical pyrotechnics who has hitherto exploited the evangel of Know-Nothingism as the basis of the larger hope within him. Carrying his repudiation of auto-centricism to the extreme verge of absolute separation of subject and object, he disposes of our ideas by simply terming them "phenomena," using that word in the limited (though customary), not strictly etymological sense of unreal appearances.

From this point the elenchus is comparatively easy, the result being not merely the denial of the ability to "fathom existence by thought," but the complete subordination of the intellect as a guide to truth to those other phases or divisions of the unextended mind which we call emotion and volition,—the latter being controlled or led by the former.

"The idea, which naturally arises when the shortcoming of the intellect is realized, that we have no power of knowing, is based only on forgetfulness of the fact that we have powers which mere intellect does not include, and to which the intellect may be made the servant. If our thoughts have not authority, our hearts may be made judges

"This is given to us in the seeming denial of our power to know. We may translate all that the intellect can apprehend into moral terms; may read in it a spiritual significance; may affirm that,—duly fulfilling the conditions of the case,—to be the truth. From that which the heart knows we have to trace, as an appearance, that which the intellect and the sense perceive." †

This is an extraordinary conclusion to draw from what, in a previous paper, ‡ I have designated Agnosticism *in excelsis*. Discarding the misleading intellect, we are asked to become omphalopsychites, and illuminated by the "divine light of Mount Tabor" find in quietism assurance of progress in true knowledge, consolation and lasting peace.

Because of our inability to throw the house out of the window, we are invited to close the only apertures through which we receive light; because we cannot transcend our ultimate noumenon and proplasm, the brain, in its loftiest function we must concentrate sentiment and volition, thereby forming a chromatic lens capable of revealing all the mysteries of the "very Life" of the universe microscopically mirrored in the epigastrium.

If this be the logical result of that Agnosticism which "has, in virtue of its inherent vitality, per-

meated all creeds, while it is antagonistic to none,"* we may safely conclude that these creeds have been re-vaccinated with a very old-fashioned prophylactic against philosophy. However the present confusion of utterances may trouble us, our feeling of insecurity is hardly so overpowering as to induce us to submit to be thus inoculated with the virus of credulity. If the choice were to be made, we should rather prefer the Hegelian doctrine of the identity of contraries and of the objective existence of Non-existence, which,—especially in England, where certain ecclesiastical institutions are deemed worth preserving,—is now growing in favor among those who seem to feel the necessity of reconciling the sign military † of Christianity, by which the faithful are separated from the infidels, ‡ with rational positive knowledge.

The professors of divinity have now for many years seen philosophy, starting from the vantage ground afforded by science, depreciating that creed in the estimation of the people and divesting it of authority. The divine light of the quietists can avail nothing with the moderns, but theologians and the many who dread the consequences of overthrowing the present theory of existence are now disposed to think their cause somewhat less hopeless than they had begun to consider it. Nothing but utter necessity would have driven the English to those "dogmas of Germany" which, says Lewes, they formerly "held as the dreams of alchemists," and which he elsewhere likens to a "miserable hut" looming like a mountain through a fog of verbal quibbles, absurdity, and "the genuine insanity of Logic."

The insular contempt for "professional philosophers" is now lost sight of in the pressing necessity felt by the schoolmen and divines of England to buttress their theologism and its moral system by that very philosophy which they have so long disdained perhaps for its non-marketable character. Behind the fog, and squarely posited on what Lewes so contemptuously terms a miserable hut, there stands an almost Athanasian trinity in unity,—the unconditioned Abstraction (the Father), the conditioned Reality (the Son), and these two in conscious identity (the Spirit). § Just as Plotinus, with his hypostases, came to the rescue of Christianity in its first conflict with philosophy, so does the hitherto contemned Hegel,—or rather his system,—find himself drawn across the

waters of the North Sea to demonstrate the sweet reasonableness of the established Church of England.

Not for a moment would I wish to be understood as covertly insinuating that selfish or sordid motives are hidden behind this evident anxiety to effect a reconciliation between faith and reason. Even though the self-assurance inspired by numbers were mine,—instead of my being one of a very small minority,—I should insinuate nothing so injurious to my own reputation. Apart from that earnest attachment which we call faith there are, there must be, serious apprehensions with respect to the moral consequences of substituting one theory of life, which has for thousands of years favorably affected the development of humanity, by another which has never been tested.

Who can wonder that the extravagant exaltation of Nescience has so far weakened the sense of duty that many timorous souls are shrinking in horror at the prospect of a future wherein ethics shall be founded on the shifting sands of hedonism and empirically suggested selection? It is not by consenting to ignore it that this apprehension can be set at rest, but rather by demonstrating,—as on page 1217, No. 56, of this journal,—that moral anarchy can never originate where the due development of every side of human nature ensures the corresponding incentive of an active desire to live in harmony with all that is or that will be revealed as cosmical law. If we succeed in making this clear to the ordinary intellect, the fear-inspired anti-revolutionary passion of reaction which now stands in the way of progress will give place to a soberer condition, enabling those who may be said to control the destinies of mankind to realize that in the body politic, as in the individual organization, disturbance and agitation indicate a disease to be counteracted by the “exhibition” of remedies calculated to relieve.

When thrones and altars shall become unnecessary to social progress because of the development of justice and the power of self-government, “the *δυνασθένη* and *σωφροσύνη* of the individual citizens,”* they will in due time quietly disappear as the nebulae consolidate into suns. Ill-advised endeavors to perpetuate them by opposing barriers will only cause that to become a destructive torrent which otherwise would continue to be a tractable stream, or to produce excrescences which, like the wen in the apologue, will contaminate the whole body on which they appear.

On the other hand, by honestly consenting to that educative process which subordinates the imagination to the judgment,—although the present supernatural theory of life has to be discarded,—we shall secure the wished-for continued higher evolution of reason and moral feeling; and if we are true to the monistic principle of fashioning our conduct with the view of estab-

lishing perfect harmony between ourselves and the infinite and eternal All of which we are, each to himself, the centre, we cannot fail to attain that condition of perfect sanity which has been termed rational holiness.

The so-called *lux benigna* of an infallible revelation may be withdrawn, and with it many long-accredited and venerated institutions may disappear, but when we have secured the absolute equilibrium of our organization in its subjective and objective aspects, we shall have found a light to “lighten the nations” in whose steady, unwavering lustre we shall be able to

“Bring white hairs unto a quiet grave.”

ALTERATIONS OF PERSONALITY.

BY TH. RIBOT.

Translated from the French by J. V. *

It has been seen, in a former paper † upon the present subject, that the basis of psychic individuality in animals is the organic sense, the consciousness of organic existence; and it has been further seen that this consciousness arises from organic sensations.

If, accordingly, we admit that the organic sensations proceeding from all the tissues, organs, and movements produced—in a word, from all the states of the body—are in some degree and form represented in the *sensorium*; and if the physical personality be only their sum total, it follows that personality must vary as they vary, and that these variations admit of all possible degrees, from simple distemper to the total metamorphosis of the individual. Instances of “double personality,” about which there has been great discussion, (we shall later speak of it,) are but an extreme case. By dint of patience and careful investigations we should find in mental pathology enough observations to establish a progression, or rather a continuous regression from the most transient change to the most complete alteration of the ego.

It is an incontestable fact, that the ego exists only on the condition of continually changing. As regards its identity this is only a question of quantity. Its identity will persist as long as the sum of the states that remain relatively fixed is greater than the sum of the states that are added to or detached from this stable group.

For the present we have only to study the irregularities of personality that are immediately connected with organic sensations. Since, by itself, general sensibility has only a very feeble psychic value, it produces only partial disorders, except in cases where the alteration is total or sudden.

By way of a beginning, we shall here notice a state which can hardly be called a morbid state, yet probably is well-known to all, and consists in an alternate

* J. S. Mill: “Prin. of Polit. Econ.,” Vol. II., book iv, chap. 7, sec. 2.

* Translation copyrighted.

† No. 93 of THE OPEN COURT.

feeling of exuberant vitality or of depression, without apparent cause. In these states the usual tone of life changes, rises, or falls. In the normal state there is a positive "euphory"; neither comfort nor discomfort arise from the body. Often, on the other hand, the vital functions become exalted; activity superabounds and seeks to expend itself; everything seems easy and profitable. This state of well-being, at first entirely physical, is propagated to the whole nervous organization, and arouses a multitude of pleasant feelings, to the exclusion of contrary ones. Everything looks bright. At other times the reverse will happen, as in states of disease, despondency, listlessness, impotence and—as consequences of grief—in fear, in painful and depressing feelings. At such times everything looks black. In either instance, however, there is no news, no event, in fact, nothing external to us, to justify this sudden joy or sadness.

Surely, in an absolute sense, it cannot be here said, that personality has been transformed. Relatively it has been so. The individual man has been changed, is not the same as before to himself, or better still, to those who know him. This, when translated into the language of analytic psychology, simply means, that this personality is constituted by elements, some relatively fixed, but others variable; that the variability having by far exceeded its average value, the stable portion has been affected, yet has not disappeared.

Now, if instead of disappearing merely to return after a brief delay to the normal state, we suppose that this change persists (a supposition that is daily realized); in other words, if the physical causes that induce this change are permanent, instead of being transitory, in such instance there is formed a new physical and mental habitude, and the centre of gravity of the individual shows then a tendency to displacement.

This first change may then give rise to others so that the transformation is constantly on the increase. For the present I shall not discuss this subject at length. I simply wished to prove that from a normal state we may by imperceptible stages descend to the state of complete metamorphosis; or that it is purely a question of degree.

In studying the disorders of personality, it is impossible strictly to determine those that have their immediate cause in the perturbations of general sensibility, because these latter by a secondary action excite psychic states of a higher order (hallucinations, feelings, and morbid ideas). I shall limit myself to instances in which they appear to preponderate.

We shall find in the "*Annales médico-psychologiques*"* five observations, which the author has grouped under the title: "An aberration of the

physical personality." Without caviling about the title, which, perhaps, conveys somewhat more than it ought, we are shown in the examples quoted how an unknown organic state, an alteration of the *cœnæsthesis*, *i. e.* of the organic sense, without any external cause, may produce a feeling of corporeal annihilation. "In the fullness of health, and in the possession of exuberant vitality and strength the person experiences an ever increasing sensation of weakness, to such a point, that every moment he has the fear of falling into syncope, and of ceasing to exist." Otherwise the sensibility remains intact; the patient eats with appetite, and if we attempt to oppose his will, he will react with the utmost energy; still he will keep repeating that he feels like one dying; that he is slowly passing away; that there are left to him only a few hours to live. Very naturally, upon this purely physical foundation at the same time there are grafted any number of delirious conceptions: one subject believes himself to be poisoned, another maintains that some demon has entered into his system, and is actually "sucking away his life," etc.

Let us, however, confine our attention to the immediate consequences of the physical state. We here encounter that state of despondency, already described, and known to everybody, yet here in a much more serious and stable form. The mental distemper increases in proportion and systematizes itself. The individual tends to be no longer the same. This forms a new stage toward the dissolution of the "ego," although as yet far from having been reached.

This beginning of a transformation, due to exclusively physical causes, is also met with in persons who maintain that they are enveloped in a veil or cloud, cut off from the world, insensible. Others seem to enjoy with delight the lightness of their bodies; will feel as if suspended in mid-air; believe they are able to fly; or have a feeling of heaviness either in the whole body, in certain limbs, or in a single limb that seems stout and heavy—all of which phenomena are naturally explained from disorders of the muscular sensibility. "A young epileptic at times felt his body so abnormally heavy, that he scarcely was able to support it. At other times he felt so light that he believed he did not touch the ground. Sometimes it seemed to him, that his body had assumed such huge dimensions that it would be impossible to pass through a certain door-way."*

In the case of the latter illusion, which relates to the dimensions of the body, the patient feels himself much smaller or much larger than in reality he is.

The local perversions of general sensibility—although by nature limited—are not of less psychologic importance. Some subjects will assert, that they no

* Sept. 1878. 5e Série, tome XX, pp. 191-223.

* Griesinger: "Traité des Maladies Mentales," trans. Doumic, p. 92.

longer have teeth, mouth, stomach, intestines, brain : which can only be explained through a suppression or alteration of the internal sensations that exist in the normal state and contribute to constitute the notion of the physical ego. To the same cause—at times aggravated by cutaneous anæsthesia—we must refer certain cases in which the patient believes, that one of his limbs or even his whole body is of wood, glass, stone, butter, etc.

After a while, he will say, that he has no body at all, that he is dead. Instances of this kind are really encountered. Esquirol speaks of a woman who believed that the devil had carried off her body ; the surface of her skin was completely insensible. The physician Baudeloque, during the last period of his life, had lost all consciousness of the existence of his body : he maintained that he no longer possessed head, arms, etc. Finally, there is a widely known instance related by Foville. "A soldier believed himself to be dead ever since the battle of Austerlitz, at which he had been seriously wounded.* When asked about his condition, he would answer: 'You wish to know how fares old Lambert? He is no more ; he was carried off by a cannon-ball. What you see there is not himself, but only a wretched machine that has been made in his likeness ; you ought to ask them to make another.' In speaking of himself, he never said 'I,' but 'that thing.' His skin was insensible, and often he would fall into a state of complete insensibility and immobility, lasting several days."

In the case just mentioned, we enter into the realm of serious perturbations ; meeting for the first time with an instance of double personality, or more strictly speaking, a discontinuity, a lack of fusion between two periods of psychic life. The present case might be explained as follows. Before his accident, this soldier, like everybody else, had his organic consciousness—the sense, the feeling of his own body : his physical personality. After the accident an internal change was brought about in his nervous organization. Concerning the nature of this change, unfortunately, we can only form hypotheses, the effects alone being known. Whatever it may have been, it resulted in giving birth to another organic consciousness—that of a "wretched machine." No kind of amalgamation had been effected between the latter and the older consciousness—the recollection of which had tenaciously remained with the patient. The feeling of identity, accordingly, is lacking ; because in the organic states as well as in others, this feeling can only result from a slow, progressive, and continuous assimilation of the new states. Here, the new states did not enter the old ego as an integral part. Hence, that odd situation in which the old personality appears

to itself as having been, and as being no more, and in which the present state appears as an external, strange thing, and as not existing. It may be remarked, in fine, that in a state where the surface of the body no longer yields sensations and where those that do arrive from the organs are equivalent almost to none at all ; where both superficial and deep sensibility is extinguished—that in such a state the organism no longer excites those feelings, images, and ideas that connect it with higher psychical life. The organism is simply reduced to the automatic acts that constitute the habitude or routine of life, or properly speaking, it becomes "a machine."

Strictly viewed, we are, indeed, allowed to assume, that the only personality in this example is the personality which recollects ; we must nevertheless acknowledge, that it is of a very extraordinary nature, existing only in the past ; and that, instead of calling it a person, it would be more correct to call it a memory.

What distinguishes the above-mentioned instance from those of which we shall speak elsewhere, is precisely this, that here the aberration is altogether physical, springs solely from body and bears solely upon the body. The old soldier did not believe himself to be *another* (Napoleon, for example, although the latter also had been at Austerlitz). The present case is as free as possible of intellectual elements.

The illusion of patients or convalescents, who believe themselves double, must also be referred to perturbations of general sensibility. At times there is pure and simple illusion without doubling, where the morbid state is projected outward, and the individual alienates a part of its physical personality. Such are the cases of the patients, of whom Bouillaud speaks, who having lost the sensibility of half of their body, imagine to have beside them in bed another person, or even a corpse. But when the group of organic sensations of a morbid nature, instead of thus being alienated, clings to the normal, organic ego and for some time coexists with it, without fusion, then and for just this space of time the patient believes that he has two bodies." A certain convalescent from a fever believed himself to consist of two individuals, of which one was in bed, while the other was walking about. Although without appetite, he ate a great deal ; having, as he said, two bodies to feed."*

"Pariset, in his early youth having been overcome by an epidemic typhus, remained several days in an extremely low state, verging on death. One morning there suddenly awoke a more distinct feeling of himself. He began to think, and seemed to experience a genuine resurrection ; but, strange to say, at the same instant he had, or believed to have,

* Michéa, *Annales Médico-psychologiques*, 1856, p. 249 et seqq.

* Leuret, *Fragments Psychologiques sur la Folie*, p. 95.

two bodies ; and these bodies seemed to him to be resting in two different beds. In so far as his soul was present in one of these bodies, he felt recovered, and enjoyed delightful repose. In the other body his soul suffered, and argued with itself : Why am I so well in this bed and so ill and oppressed in the other ? This thought preoccupied him for a long while. Pariset himself—a man most subtle in psychological analysis—has many times told me the detailed history of the impressions which at that time he experienced.*

In the above we possess two instances of double *physical* personality. Although as yet we are not far advanced in our study, the reader, at all events, is able to see, how the two cases referred to, when closely examined, are really unlike. The current term of "double personality" is but an abstraction. As soon as we translate it into concrete facts, into authentic observations, we shall only find diversity. Each case, as it were, asks for a particular interpretation ; and *a priori* we certainly might expect one. Personality—as we maintain, and as we shall further attempt to prove—being a very compound complex, it clearly follows that its perturbations likewise must be multiform. Each case shows it as differently decomposed. Disease becomes a subtle instrument of analysis, and affords us knowledge that is inaccessible by any other method. The main difficulty is to interpret it satisfactorily ; but even errors will only be transitory, since the facts which the future has in store will serve either to verify or rectify them.

THE SITAHARANAM ; OR, THE RAPE OF SITA.

AN EPISODE FROM THE GREAT SANSKRIT EPIC "RAMAYANA."

TRANSLATED INTO ENGLISH BY PROF. ALBERT H. GUNLOGSEN.

IV.

SITA heard the loud challenge from the wood, and she thought it like her husband's voice.

At once she said to Lakshmana : "Go quickly in search of Rama, for my heart is filled with evil forebodings. I have heard a repeated loud call, like of some one in great distress ; hasten, therefore, O son of Sumitra, to the assistance of your elder brother, your faithful companion and ally ! Speed to the rescue of your brother, imploring aid ; he must have fallen into the violent hands of Raksha-fiends, like a king into the jaws of roaring lions."

Listening to her exaggerated speech, as women's often will be, Lakshmana replied to Sita, whose eyes from fear seemed ready to start out of her head : "It is not possible that my brother be vanquished, not even by all the powers of the three worlds or by the

entire host of Suras and Asuras." And he further spoke somewhat sternly to Sita :

"This Raksha-fiend could not hurt my brother even in his smallest finger ; therefore, O lady, why thus alarmed ? And mindful, moreover, of my brother's command I must not go, even if told so by you." To this Sita, the daughter of Janaka, impatiently replied :

"Lakshmana, you are your brother's foe under a friend's disguise, if you do not hasten to his aid, being in such a predicament. You wish his ruin, I should think ; there is no brotherly affection in you ; therefore you stay, with the greatest indifference, looking upon Rama's sovereign glory.

"O Lakshmana, you wish Rama killed for my sake, and therefore you take no heed of the words uttered by me ; but bereft of Rama I would not live one single moment longer. Therefore, O hero, do my bidding, and without delay protect your brother ! Surely, if Rama be in a predicament, what then are you more unto me, who am not going to live one instant longer, if you do not start in search of Rama ?"

Then Lakshmana replied to the daughter of the king of Videha, who had spoken this in a voice, stifled by tears of sorrow, and looking like a timid, trembling hind : "O lady, among all gods and men, Gandharvas and birds, Rakshas and Pisachas, Kinnaras, reptiles and terrible Danavas,* there is not, O you fair one, a single who is a match for Rama. Like unto great Indra himself, although but a man, Rama is invulnerable in battle. Therefore, desist from this language. I cannot leave you here alone without Rama. O daughter of Videha, you are a pledge entrusted to my care by the magnanimous, truthful Rama, and I cannot leave you here alone. And moreover we have already, O dear lady, performed many valiant deeds against these cruel Rakshas for the clearance of Janasthana—so may you ever be happy ! The Rakshas in the forest will besides often imitate various sounds ; therefore do not mind a merely wanton wish for doing harm. Rama's glorious strength is unutterable ; without reflecting you cannot compare it to that of any other ; therefore may you not speak thus. Be then easy at heart, and leave off all this anxiety. Your husband will soon return, when he has killed that wonderful antelope. The sound that you heard, O lady, surely was not his own voice ; for if even placed in a difficult predicament, Rama never would utter an undignified sound."

Thus addressed, the excited Videha, with reddening eyes in an angry tone replied to Lakshmana, although he had spoken but fairly :

"O you unworthy, merciless destroyer of men, and

* All names of demi-gods and demons. The Gandharvas were the heavenly musicians ; the Kinnaras, a class of demi-gods in the retinue of Kuvera, god of riches ; the Danavas, a race of Titans, enemies of the gods, and sons of Danu, the daughter of Kasyapa, the latter a mythic Hindu seer.

CORRESPONDENCE.

EXTRACTS FROM OUR CORRESPONDENCE UPON THE SINGLE-TAX QUESTION.

To the Editor of THE OPEN COURT :—

I LIVE in a town of 3,000 inhabitants. Nearly all the vacant lots are owned by an English Land Company. Three years ago I bought from this company a lot : size, fifty feet front, for which I paid one hundred and ninety dollars. I built a cottage on it, in which I live. The Land Company owns a lot contiguous to and exactly like mine. It also owns many others all around me. * * * My lot without improvements, and the company's lot by mine, are now worth three hundred dollars each.

Last year my city, county, and state taxes on my house and lot were about fifteen dollars. On the Englishmen's lot, the taxes were about one dollar and fifty cents. * * *

It is very possible, therefore, that ten years hence the lot by mine will belong to the Land Company. It is also probable that each of these lots will then be worth one thousand dollars, and that in the ten years I will pay fully \$200 taxes on mine—possibly more. And that the company will pay about \$25 on their lot, which, counting the natural accumulations on the amounts, we pay out each year. It will be an actual cost to me of about \$400, and to the company of about \$50. So, aside from the fact that I, by improving my lot, will do my share in increasing the value of all my neighbor's property ; and also will expend my labor in the town, and in trade and otherwise, distribute a large share of the products of my labor among my neighbors, this community will charge me \$400 in the next ten years for making a profit of \$700, and will charge these Englishmen \$50 in the same time for making \$700. And none of the \$1,400 will be produced by the Englishmen or me, except what part we create as one of the whole community.

The total taxes, two lots, for ten years will be \$225. My share \$200, Englishmen's \$25. Under Henry George's system with the same assessment, if the Englishmen chose to retain the use of their lot, they would pay \$112 50 and I would pay \$112 50.

JEROME LYNCH.

To the Editor of THE OPEN COURT :—

IF private property in land be just, then is the single-tax confiscation. There can be no confiscation of land because as against the State no man owns land.

"Absolute private property in land has no legal existence and is an impossibility being incompatible with civil government."

No man absolutely owns land. "He may hold it is true an estate in the land. This estate consists of three things: the right of possession, the right of enjoyment, and the right of disposition subject to the right of the State to alter or defeat it and subject to the right of the State to tax it." * * *

The compensation granted by the State when it resumes possession of its land, as for instance when it wishes to erect a school-house is for the violation of the implied lease. "But there is no violation of any contract real or implied when any rate of taxation or rent is fixed by the State." * * *

I am aware that the State has allowed the essentially political character of land to be lost sight of, because, until recently, of the plentitude of land.

I am also aware that it has treated land as though it were actually private property. But no man holds or can hold land on any other ground than that which I have described nor can he have any right to object when the State demands rent for its land whether it is collected by rent or tax. * * *

Wheelbarrow may object to the single-tax as an economic measure, but when he attempts to affirm the existence of absolute

the ruin of families ! I might take you for a fond lover, and that therefore you have spoken in this way. It is not fair between brothers, O Lakshmana, what would be bad even among men, who like you are pleased to walk in darkness. You are surely the only foe, threatening Rama in the wood, and it is for my sake that you dissemble ; or is it perchance at the instigation of Bharata ?* But I, having obtained my Indivira-like, Kamala†-eyed Rama, how could I stoop to love a husband of a meaner extraction ? I rather look forward to the funeral fire and beside Rama I shall never touch another man—not even with my foot !” Thus Sita, like the daughter of a Sura, spoke to Lakshmana, all the while weeping, and beating her breast with her hands. At these harsh and heart stirring words, Lakshmana with great emotion, in a humble attitude replied to Sita : “You being to me like a higher divinity, I cannot answer ; but an extreme language like this, O daughter of Mithila, does not beseech women. The temper of women all over the world is ever the same—fickle, refractory, obstinate, and often working the ruin of their brothers. May all the living creatures that stir in this wood listen to me, while protesting that you have abused me, when as was my duty I only spoke the truth. Woe to you ; you will surely perish, since in your womanly perverseness you thus suspected me, when I only remained true to my master's word !”

Having uttered this harsh speech, after a while, filled with compassion, he began to speak to Sita as always he had been accustomed : “I shall indeed go in search of Rama, and may you be blessed, O you fair one ! May all the good genii of the forest watch over you, although evil forebodings besiege me ! On my return I hope to find you with Rama.” Lakshmana thus addressed Sita, and she with streaming eyes answered : “Without Rama, O Lakshmana, my only hope will be the river Godavari ; I shall either strangle myself, or die from exposure in the wilderness, or rather fling myself into the blazing funeral fire ; for beside the noble Rama I shall never touch another man—not even with my foot !” Thus Sita spoke in her grief to Lakshmana, bitterly crying, and beating her bosom with her fists. The son of Sumitra, at the sight of the fair, weeping woman, who had become a picture of distress, sought to comfort her ; but Sita said nothing more to her husband's brother. Lakshmana then took leave of Sita, with folded hands and civilly bowing. The inspired hero again cast a transient glance at the daughter of Mithila, and thereupon set out in the direction leading to Rama's presence.

* Bharata, Rama's half-brother.

† Indivira, the blue Lotus (*Nymphaea Carolaea*) ; Kamala, also a kind of Lotus (the *Nelumbium Speciosum*).

private property in land, he has raised up a mightier adversary than Mr. George—the combined legal and judicial talent of the civilized world.

WM. C. WOOD, M. D.

GLOVERSVILLE, N. Y.

To the Editor of THE OPEN COURT:—

I HAVE carefully considered Georgeism as expressed by Mr. Pentecost. I have come to the conclusion that the *disadvantages* of it are, all but one, such as *time* would rightfully adjust if the *advantages* are such as would warrant waiting for adjustment. But there is one I cannot see how "Father Time" or any one else can adjust. It is the fact that there are *improvements* that become so incorporated with the land that their value *cannot* be separated. Now Mr. Pentecost evades this point. In fact he does not seem to comprehend it, for he recommends farmers to calculate what their farms are worth without improvements! Taking it for granted that improvements do not mean simply buildings, fences, and the like, if there lives a farmer who can make the calculation, I will confess that I know *nothing* of farming, if I *have* made it a study. He says Wheelbarrow does not understand when any body ought to understand what "the full rental value of the land *itself*" is; yet he takes it for granted that *he* understands the mysteries of making a first class farm.

It would be a waste of space to give any more object lessons to show how improvements disappear for he has entirely failed to digest those already given.

Now I wish to show how the difficulty would be solved. Such improvements as serve to increase the producing capacity of the soil would be taxed to their "full rental value" if the "land *itself*" was taxed the "full rental value," thus putting a stop to improvements of this kind, for what *fool* is going to spend labor and money *ONLY* to increase his tax bill? While buildings of very little use to any one but the owner could be built as fine as the owner pleased without increasing tax.

I think Wheelbarrow's bread would be dearer than ever but perhaps he could steal a fine house and eat it!

And how about forests? The "full rental value" would tax *nearly* all the forests out of existence. One-fourth of all land, at least, should be in forest. This would make lumber lower than the forest owners could afford, even without *any* tax.

Yours Truly,

MILL GREEN, MD.

CHAS. M.—

NOTES.

It is announced that the Lincoln History, so long continued in the *Century*, will conclude with the six ensuing papers.

We call the attention of our readers to an able and suggestive article in the *Forum* for July, by Bishop Potter. The subject is "The Scholar in American Life."

A correspondent, Mr. Horace P. Biddle, of Logansport, Indiana, informs us, that the lines quoted at the bottom of page 1690 of the last issue of THE OPEN COURT, are by Fitz-Green Halleck, and not by Ben Jonson. They were written on the death of Joseph Rodman Drake.

The well-known and standard work of Archbishop Trench, "English Past and Present," has been published in pamphlet form, in two parts, by the Humboldt Publishing Company, of New York. A book that should be thoroughly studied by every student of English is thus placed within the reach of all.

A work which has created quite a stir in German theological circles is "The Struggle for Salvation," by Wilhelm Bender. It is an attempt to place religion upon a modern standpoint; to lay its foundation anew upon the lines of modern science. A critical review of the book, by P. Michaelis, will shortly be published in THE OPEN COURT.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXVII.—Continued.

"In this also there is a loss," returned the High Steward; "distinguished men have become rare. I am ready to acknowledge the advance which the citizen classes have made in the last fifty years. But the capacity which a people develop in trade and commerce is seldom united with secure self-respect, nay, seldom also with that firmly-established position which is necessary to political strength. Too frequently we find a wavering between discontented insolence and over-great subserviency; covetousness abounds, and self-sacrifice is small. Wealth increases everywhere; who can deny that? But not in the same degree a comprehension of the highest interests of the nation."

"Time will improve," rejoined the Scholar, "and our sons will become firmer and freer; here too our future belongs to those who work laboriously."

"Much may be lost," said the High Steward, "before the improvement which you expect becomes great enough to secure to those who are struggling onward a salutary and active participation in the affairs of government. I am too old to nourish myself with hopes, and therefore cannot adopt your sanguine conception of our situation. I wish for the good of our nation, in whatever way it may come. I know it has passed through crises more critical than its present swaying between a decaying and a rising culture. But I feel that the air in which I live is growing more sultry; the tense excitement of contrast more dangerous. When I look back on a long life, I sometimes feel horror at the moral pestilence that I have contemplated. It was not a time of gigantic vices like your Imperial era, but it was a time in which, after short poetic dreams, the weakness of petty souls ruled and brought distraction. The figures which in this lamentable time have passed away will appear to posterity, not fearful, but grotesque and contemptible. You, Professor, live in a new epoch in which a younger generation awkwardly endeavors to rise. I have no sympathy for the new style. I have not the courage to hope, for I have no power to promote the culture of the younger generation."

He had risen. The old man and the young, vigorous man, the diplomat and the scholar, stood opposite to each other; the one an advocate for the world which was tending downwards; the other a proclaimer of a teaching which was unceasingly to renew the old world; secret sorrow lay on the calm countenance of the old man, and feeling, vigorous feeling, worked in the animated features of the younger: a high mind and a refined spirit were visible in the open countenance of both.

* Translation copyrighted.

"What we had to say to one another," continued the High Steward, "is said. I have endeavored to make amends for my mistake in regard to you. May the gossiping openness with which I have exposed myself to your judgment be some small compensation for my having been so long silent. It is the best satisfaction that I can give to a man of your sort. As respects the diseased state of mind of others, which was the subject of our conversation, there need be no further words between us; both of us will endeavor to do what is our duty concerning the men that are entrusted to our care, to preserve them from danger and to guard ourselves. Mr. Werner, farewell. May the occupation which you have chosen preserve your joyful confidence in your time and your generation for as many years as I bear on my head. This highest happiness of man, I, an insignificant individual, have painfully felt the want of, as did your great Roman."

"Allow me, your Excellency, to express one request to you," replied the Scholar, with warm feeling. "Often may the unpractical activity of the new apostles evoke a bitter smile from you, and the unfinished work which we pioneers of learning throw off will not always satisfy the demands which you make upon us; but when you are compelled to blame us, remember, with forbearance, that our nation can only bear within it the guaranty of renewing youth so long as it does not lose respect for intellectual aspiration, and retains its simple honesty, in love and hate. So long as the nation renews itself, it may inspire its princes and leaders with new life; for we are not Romans, but staunch and warm-hearted Germans."

"Nero no longer ventures to burn the apostles of a new doctrine," replied the High Steward, with a sad smile. "May I say something kindly from you to the Sovereign, as far as is compatible with your dignity?"

"I beg you to do so," replied the Professor.

The Professor hastened to take leave of the Princess. She received him in the presence of her ladies and the Marshal. Few words were exchanged. Upon expressing the hope of seeing him soon again at the capital, speech almost forsook her. When he had left the room, she flew up to her library and looked down on the carriage into which the chest was being put. She plucked some flowers which the gardener had placed in her room, and fastened them together with a ribbon.

"His eye looked upon you, and his voice sounded in the narrow halls in which you are passing your life. It was a short dream! No, not a dream, a beautiful picture from a new world.

"As the womanly heart submits, in loving devotion, to the stronger mind of a life-companion, her eye fixed upon his, such is the happiness of which I have had a presage. Only once has my hand touched his, but I feel as if I had lain on his heart, invisible, bodi-

less. No one knows it, not even himself, I alone felt the happiness. Light, airy bond, woven of the tenderest threads that ever were drawn from one human soul to another, thou must be torn and blown away! Only the consciousness remains that the inclination which drew two strangers together has been forever a blessing to one of them.

"You, earnest man, go on your path, and I on mine; and if accident should bring us together, then we shall bow civilly to each other, and greet one another with courtly speeches. Farewell, my scholar. When I meet with one of your associates, I shall henceforth know that he belongs to the silent community, in whose porch I have humbly bowed my head."

From the tops of the trees on which the princely child was looking down the birds were singing. The carriage rolled away; she bent down, and held the nosegay with outstretched hand; then with a powerful swing she threw the flowers on to the top of a tree; they hung among the leaves; a little bird flew out, but the next moment he again perched by the nosegay, and continued his song. But the Princess leaned her head against the wall of the tower.

The Scholar drove to the city with the chest he had found beside him. More rapid and stormy than on his coming were the thoughts that flitted through his soul; he hastened the coachman, and an indefinite anxiety fixed his looks on the rising towers of the capital. But amidst all, he ever saw the figure of the High Steward before him, and heard the sorrowful words of his soft voice.

"Inmeasurably great is the difference between the narrow relations of this Court and the mighty greatness of Imperial Rome; immeasurably great also the difference between the troubled Court lord and the gloomy power of a Roman senator. And yet there is something in the structure of the soul that has this day displayed itself to me which reminds me of a figure from a time long past; and what he said sounds in my soul like a feeble tone from the heart of the man whose work I seek in vain. For just as we endeavor to explain the present from the past, so do we interpret circumstances and figures of a past time in the light of the men that live around us. The past unceasingly sends its spirit into our souls, and we unceasingly adapt the past to conform to the needs of our hearts."

CHAPTER XXXVIII.

THE MAGISTER'S EXIT.

PROFESSOR RASCHKE was sitting on the floor of his room. The bright colors of his Turkish dressing-gown were faded; constant perseverance in scientific service had given it a tinge of pale grey, but it still continued worthily to cover the limbs of its master. The Professor had seated himself by the side of his

eldest son Marcus, in order to facilitate the latter's study of the first book of A, B, C. While the little one, tired of the pictures, was resting, his father made use of the pause to draw a small copy of Aristotle out of his pocket. He read, and made remarks with a pencil, not observing that his son Marcus had long thrown away the picture book, and with the other children danced round their father.

"Papa, take your legs away; we can't get round them," exclaimed Bertha, the eldest, from whom, indeed, one might have expected greater discretion.

Raschke drew in his legs, and as after that he found his seat uncomfortable, he desired the children to bring him a chair. They brought the chair, and he supported his back against it.

"We can't get around yet," cried the dancing children.

Raschke looked up. "Then I will sit upon the chair."

That was satisfactory to the children, and the noisy hubbub continued.

"Come here, Bertha," said Raschke; "you may act as my desk." He laid the book on her head whilst he read and wrote; and the little one stood as still as a mouse under the book, and scolded the others because they made a noise.

There was a knock; the Doctor entered.

"Ha, Fritz!" called out the Professor; "I hardly recognized you; I must try to recall your face. Is it right to set your friends aside in this way, when a friendly greeting might do you good? Laura has told me what has happened to your dear father. A heavy loss," he continued, sorrowfully: "if I am not mistaken, two hundred thousand."

"Just one cipher too much."

"It matters little," replied Raschke, "what the loss is, compared with the sorrow it occasions. I should have been with you, Fritz, at that time. I started immediately, but a circumstance interfered with my intention," he added, embarrassed. "I have long been accustomed to go to your street in the evening, and—well—I got to the wrong house, and with difficulty found my way back to the lecture."

"Do not pity me," replied the Doctor; "rejoice with me—I am a happy man. I have just now found, what I despaired of obtaining, Laura's heart and the consent of her father."

Raschke clapped the Doctor on the shoulder, and pressed first one hand, then the other. "The father's!" he exclaimed; "he was the hindrance. I know something of him, and I know his dog. If I may judge of the man by his dog," he continued, doubtfully, "he must be a character. Is it not so, my friend?"

The Doctor laughed. "There has been an old enmity brooding over our street. My poor soul has

been unkindly treated by him, like the Psyche in the tale of Venus. He vents his anger upon me, and gives me insoluble tasks. But beneath all his insolence, I perceive that he is reconciled to my attachment. I anticipate happiness, for I am to-day to accompany Laura to Bielstein. On my friend's account alone have I wished to start earlier on this journey. I cannot rid myself of one anxiety. I am disturbed that the Magister is in the neighborhood of Werner."

Raschke passed his hand through his hair. "Indeed," he exclaimed.

"I have distinct reasons for this," continued the Doctor. "The dealer who was said to have brought the forged parchment strip of Struvelius to the city was sent to me by the mother of the Magister. I dealt severely with him, as was natural; but he assured me that he knew nothing of such a parchment, and never had sold such a sheet to the Magister. The anger of the man at the false assertion of the Magister has made me very anxious. It confirms a suspicion that I have expressed in a letter with respect to the genuineness of another piece of writing which has been mentioned to me by Werner from the capital. I cannot help fearing that the Magister himself was the forger, and a terror comes over me at the thought that he is now exercising his art upon our friend."

"That is a very serious affair," exclaimed Raschke, pacing up and down, disquieted. "Werner trusted the Magister implicitly."

The Doctor also paced up and down. "Only think, if his noble confidence should make him the victim of a deceit. Fancy what a bitter sorrow that would be to him. He would long struggle sternly and self-tormentingly with a painful impression, which we should not be able to obliterate without great effort."

"You are quite right," said Raschke, again passing his hand through his hair. "It is not in him to be able to overcome moral delinquency without great excitement. You must warn him at once, and that face to face."

"Unfortunately I cannot do that for several days; meanwhile, I beg of you to make Professor Struvelius acquainted with the statement of the dealer."

The Doctor went away. Raschke forgot Aristotle, and meditated anxiously on the treachery of the Magister. Whilst so doing, there was a knock, and Struvelius, with Flaminia, stood at the open door.

Raschke greeted them, called his wife, begged them to sit down, and quite forgot that he was in his Turkish dressing-gown.

"We come with one wish," began Flaminia, solemnly. "It is with respect to our colleague Werner. My husband will impart to you what has moved us both deeply."

(To be continued.)

BOOK REVIEWS.

THE TWO CHIEFS OF DUNBOY. An Irish Romance of the Last Century. By J. A. Froude. New York: Charles Scribner's Sons. Chicago: A. C. McClurg & Co.

This is a story that ought to be read by every American, because the moral of it presses at this moment with alarming weight upon American statesmanship. In the ghastly presence of the Cronin tragedy, it will not do to say that Mr. Froude has exaggerated the conspiracies and plots that were part of the social life of Ireland a hundred and thirty years ago. In this romance the Americans may read the history, and learn the origin of that barbaric scheme of change, which, transplanted from Europe less than fifty years ago, has taken firm root in American soil, the scheme of conspiracy and murder.

It has been fashionable, for certain reasons, to class Mr. Froude's histories among the romances of the day. He now gives us a romance containing history which in the face of Chicago evidence, his most hostile critics will not venture to dispute. Mr. Froude has given us in the form of a novel, a very dramatic sketch of Celtic Ireland in the eighteenth century. As a novel, it will have ten readers, where, perhaps, as a history, it would have had but one. It is the very irony of Irish luck that Mr. Froude's enemies in Chicago, while denying the correctness of his pen-pictures of characters, actually furnish the most tragic evidence that they are unfortunately true. At the same time every fair-minded Englishman will sympathize with Mr. Froude in his condemnation of the stupid, criminal, and avaricious policy adopted by the English for the misgovernment of Ireland. He draws a terrible indictment against the statesmen of England in the following words:

"When the actions of men are measured in the eternal scale, and the sins of those who had undertaken to rule Ireland and had not ruled it are seen in the full blossom of their consequences, the guilt of Morty, the guilt of many another desperate patriot in that ill-fated country, may be found to bear most heavily on those English statesmen whose reckless negligence was the true cause of their crimes."

The two chiefs of Dunboy are Col. Goring, an Englishman upon whom the estate has been cast by confiscation from its ancient owners, and Morty O'Sullivan, the hereditary owner, who had forfeited his inheritance by treason. Morty O'Sullivan was chief of the O'Sullivan sept, and it is a strange coincidence that this name, justly, or unjustly, is prominent in the Cronin tragedy. Col. Goring and Morty O'Sullivan are the rival heroes of the story.

Col. Goring is a soldier of the Stonewall Jackson, Henry Havelock, and Chinese Gordon type, and it is very evident that Gordon was the model used by Mr. Froude in moulding the character of Goring. In fact, he writes "Gordon" sometimes instead of "Goring." The printer followed copy, and Mr. Froude in revising the proof-sheets failed to notice his own mistake. Goring plants an English colony on the Dunboy estates, and develops the mining, manufacturing, and fishery industries. He is also commander of about a hundred miles of coast, with the duty of preventing smuggling within his jurisdiction. He is governed in all his actions by religious duty, and is morally and physically above the sense of danger. Knowing that he may be assassinated at any moment he goes about his work unarmed and unattended, sometimes miles away from home. He believes that he is "the servant of God," and that he will be spared so long "as it is God's will." He furnishes most of the employment and charity for the peasantry round about, and yet he knows that as a protestant and a "Saxon" his life is forfeited according to their national and religious code. One morning after he had relieved a crowd of people, some with money, some with food, some with clothes, and some with medicine, he said to a friend:

"They believe in me, and I suppose that in their hearts they have a regard for me. Yet of all the men you have seen here to-day there is hardly

one who would not try to shoot me if he was so ordered by the secret societies."

So long as this is true in the United States to-day, it is idle to deny that it was true in Ireland, a hundred and thirty years ago.

Col. Goring expected that the Irish would oppose his enterprises, and hamper him in the performance of his duties. This was natural, but he was amazed that the English officials in Ireland thwarted him at every step, and even censured him. His colony was Presbyterian, although he himself was of the established church, but his people found out that they could not worship in their own way, nor teach their children the rudiments of knowledge without breaking the law. The colonists rather than violate their own consciences or the laws of the land abandoned the settlement and sailed for America. In like manner the barbarous laws restricting Irish trade had made smuggling a patriotic duty, and Col. Goring found that his efforts to suppress smuggling were not approved by his superior officers. His duty was to enforce the laws, and he was expected to wink at their violation. No less a personage than the protestant Archbishop of Dublin said to him, and with good reason too, "You cannot live in Ireland without breaking laws on one side or the other." Goring could not understand such loose political morality as that. It was incomprehensible to his English mind. He was betrayed to his death exactly as Dr. Cronin was, but up to the last moment of his life he maintained that a law which ought not to be enforced ought to be repealed.

Morty O'Sullivan was a fanatic of another type. He was a Celtic chief whose lands and whose people had been conquered by the Saxon. His overmastering passion was hatred of the English, and his religious duty was to uproot them from the soil of Ireland. He would not be satisfied with anything less than their utter extermination. He was a brave and chivalrous man, a soldier polished at the court of Austria. He had fought with Prince Charles at Culloden, had escaped to the continent after the battle, was outlawed by the English, his land confiscated, and a price set upon his head. After gaining distinction in the Austrian army, he threw up his commission that he might accept the command of a French privateer to harass the English coast, to prey upon English commerce, to protect the contraband trade between Ireland and France, to supply arms to the Irish, to conduct the correspondence between the Irish chiefs and the government at Versailles, and finally to organize an insurrection in Ireland which was to be assisted by a French army landed at Bantry Bay.

As Col. Goring's efforts to establish English law in Ireland were thwarted by the English, so in another way Morty O'Sullivan's efforts to establish Irish law in Ireland were thwarted by the Irish. He could never get his countrymen to rise to the dignity of war; they would not go farther than a conspiracy, and conspiracy was hateful to the soul of Morty O'Sullivan. In the anguish of disappointment he one day said:

"None are braver than we when cow's tails are to be cut off, or the enemies of the country shot from a hiding place. But to stand up and fight the Saxon in an honorable field as the Scots did with Bruce and Wallace, that is beyond us, and therefore we are what we are."

There is pathos in the despair of Morty O'Sullivan when he finds that his countrymen will not follow him to fight with the English in the open field. He rejects all their importunities to draw him into conspiracies to assassinate. He says:

"We call ourselves patriots and we have not the spirit to face our tyrants like men. We are false to one another. We shall be false to any friend that trusts us."

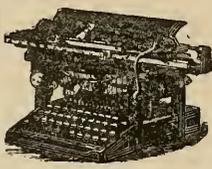

"The sun will never shine on free Ireland till she has learned to face her conquerors with better weapons than the murderous knife."

Mr. Froude's romance appears at an opportune moment, and the lesson of it will not be lost. Habitual conspiracy deteriorates a people, and a people who merely conspires and assassinate will never be a match for a nation that fights.

MAKING BREAD DEAR.

A CONTROVERSY BETWEEN
WHEELBARROW and SYMPATHIZER

UPON
Corners and The Board of Trade

WITH REFERENCE TO
THE LABOR QUESTION.

PRICE, 10 CENTS.

This little pamphlet is a reprint from the columns of THE OPEN COURT of an able and spirited controversy between Wheelbarrow and a prominent Chicago financier. The title indicates the subject. Wheelbarrow attacks the combinations of trade that "make bread dear and laborers cheap." Sympathizer declares Wheelbarrow's article a misrepresentation of facts, and characterizes it as misleading and obscure. Wheelbarrow replies, explains more fully his position, and contends that the arguments of Sympathizer have only strengthened the stand he has taken. The discussion is by practical men, and forms an interesting chapter in economics.

LIFE - LORE :

A MAGAZINE OF POPULAR NATURAL HISTORY.

EDITED BY W. MAWER, F.G.S.
4 Essex Street, Strand, London, W.C.

THE SUBJECT-MATTER is Life—Life in all its forms, plant and animal, from the "lowest" to the "highest," recent and extinct.

No. 1. WAS ISSUED JULY 1, 1888.
"A high-class scientific periodical."—*School Board Chronicle*.
"A decided advance upon its predecessors."—*Liverpool Courier*.
"Well printed, well illustrated, and ably edited."—*Printing Times*.
"An illustrated monthly magazine of great merit."—*Glasgow Herald*.

TO ADVERTISERS!

For a check for \$20 we will print ten lines advertisement in ONE HUNDRED ISSUES of leading American Newspapers and complete the work within ten days. This is at the rate of only one-fifth of a line for 1,000 Circulation. The advertisement will appear in but a single issue of any paper, and consequently will be placed before the eyes of the different newspaper purchasers; or FIVE MILLION READERS, if it is true, as is sometimes stated, that every newspaper is looked at by five persons on an average. Ten lines will accommodate about 75 words. Address with copy of Adv. and check, or remittance for Book of 25 pages.
GEO. F. ROWELL & CO., 10 SPRUCE ST., NEW YORK.

We have just issued a new edition of our Book called "Newspaper Advertising." It has 256 pages, and among its contents may be named the following Lists and Catalogues of Newspapers:—
DAILY NEWSPAPERS IN NEW YORK CITY, with their Advertising rates.

DAILY NEWSPAPERS IN CITIES HAVING more than 100,000 population, omitting all but the best.
DAILY NEWSPAPERS IN CITIES HAVING more than 50,000 population, omitting all but the best.

A SMALL LIST OF NEWSPAPERS IN which to advertise every section of the country; being a choice selection made up with great care, guided by long experience.

ONE NEWSPAPER IN A STATE. The best one for an advertiser to use, and the one we will use but one.
EAGLE EYES IN ADVERTISING. In leading Newspapers in many principal cities and towns, a List which offers peculiar inducements to some advertisers.

LARGEST CIRCULATIONS. A complete list of all American papers issuing regularly more than 25,000 copies.

THE BEST LIST OF LOCAL NEWSPAPERS, omitting all but the best of 5,000 population and every important county seat.

A COMPLETE LIST OF LOCAL NEWSPAPERS, in which advertisements are inserted at half price.

6,472 VILLAGE NEWS PAPERS, in which advertisements are inserted for \$2.15 a line and appear in the whole lot—namely, for all the American Weeklies sent to any address for **THIRTY CENTS**.

Naturwissenschaftliche Wochenschrift.

Redaction: Dr. H. Potonik.

Verlag: Hermann Riemann.

BERLIN NW. 6, Louisepl. 11 (Germany).

Die reich illustrierte "Naturwissenschaftliche Wochenschrift" bringt allgemein interessante Aufsätze und orientiert über die Fortschritte aus dem Gesamtgebiet der Naturwissenschaft und ihrer praktischen Anwendung, sowie über die gesammte Literatur und das wissenschaftliche Leben. Auch dem sich für Naturwissenschaftlich Interessierenden Lesern ist die "Naturwissenschaftliche Wochenschrift" durch allgemein verständliche Sprache ein wertvolles Organ.

Preis vierteljährlich in U. S. & Canada:
80 Cts.

Secular Thought

A Journal of Liberal Thought.

The Official Organ of the Canadian Secular Union.

\$2 a Year. Published Weekly. Single Copy, 5c.
CHARLES WATTS, EDITOR.

31 Adelaide Street East, Toronto, Ont., Canada.

Read what Colonel Ingersoll says:

"I am greatly pleased with 'Secular Thought'—with its form, arrangement, and contents—above all, with its spirit. It is splendid. I don't see how it could be better. I read it with the greatest of pleasure."
COL. ROBT. C. INGERSOLL.

Read what Helen H. Gardner says:

"Permit me to congratulate you on the fine appearance and tone of 'Secular Thought.' I heartily congratulate our Canadian friends upon the fact that they are represented by a paper of which they can be justly proud, and which they need never hesitate to hand to their most delicate-minded friends, however religious they may be."
HELEN H. GARDNER.

"GERMANIA."

A Fortnightly Journal for the Study of the

German Language and Literature.

Subscription price \$3.00. Sample copies free.

A. W. SPANHOOF,

Editor and Publisher.

P. O. Box 99, MANCHESTER, N. H.

The Academy, Syracuse, N. Y.—We have before us the first four numbers of this new magazine, and feel justified in indicating the favorable opinion expressed by the daily press and some of our leading college professors of German. . . . On the whole, GERMANIA is well adapted to private study of German, and, we are sure, will be welcomed by teachers as a pleasant companion to the usual text-books. Even at the present rates for single copies teachers will find in its columns varied and interesting reading for their classes, at a reasonable rate. We urge all teachers of German to examine the magazine with this object in view.

THE TEACHER'S OUTLOOK.

Published by The Teacher's Publishing Company, Des Moines, Iowa. A monthly magazine devoted to the interests of teachers and advanced pupils and intended to supplement the good work done by other school journals rather than to occupy the same field. Instead of filling its columns with school methods, school aids, and the details of school work, it will aim to interest the teachers in matters outside of the atmosphere of the school room, and its columns will furnish an Outlook upon affairs of life, facts in science and nature which illustrate and test the theories of the schools. In this work it will hope to furnish the teacher with a natural source of inspiration and mental energy, quicken thought and make the schoolroom a place joyous with buoyant spirits that offer a responsive greeting to the aspiring mind of youth, rather than a heavy weight with that gloom and dullness which often surrounds the daily toil.

A leading feature of the magazine will be a monthly review of current scientific, civil and industrial problems, scientific inventions, discoveries, etc.

Another feature will be a very complete Review of current Literature, especially of all good magazines coming within the sphere of its labor. We have entered into arrangements with all the leading publishers to keep us informed of all their new and prospective publications, and the Reviews will be made by competent critics.

Still another feature, and a very important one as giving a practical value to the OUTLOOK offered, will be the formation of a circle of writers out of its subscribers, from which it hopes to draw its corps of contributors. This plan is original as applied to a magazine, and is based on the lack of co-operation or mutual helpfulness. If met with that appreciation necessary to its full execution it will be the means of introducing many new writers to the public, and of aiding many who now lack the training in the expression of thought necessary the field of literature into which their tastes would lead them. \$1.50 per annum. Sample copies 20 cts. Good pay to agents. 112

THE

Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY

By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects:

1. *The Psychology of the Cell*—Introductory.
2. *The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.*
3. *The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition: Predatory Habits of Certain Animalcula.*
4. *Colonies of Unicellular Organisms.*
5. *Fecondation of Proto-Organisms.*
6. *Fecondation of Higher Animals and Plants.*
7. *The Physiological Function of the Nucleus.*
8. *Correspondence between Alfred Binet and Ch. Ricket (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.*

PRESS NOTICES.

*** "The little book will be no less than fascinating to all who are interested in the subject of comparative psychology." *** *Boston Beacon*.
*** "Intensely interesting." *** *Pharmaceutical Era*.

*** "We recommend the book to all earnest students of the great problems of evolution, as being unequalled in the representation of modern biological investigations." *** *Reformed Quarterly Review*.

*** "The hook will repay rental." *** *N. Y. Medical Abstract*.

*** "This monograph is an original work and will add a new light to the vision of the scientist and general reader." *** *Toledo Blade*.
*** "A very remarkable book." *** *Health and Home*.

PUBLICATIONS OF "THE OPEN COURT."

Three Introductory Lectures

—on—

The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

By F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

Neatly Bound in Cloth. Price, 75 Cts.

The Idea of God.

By Dr. PAUL CARUS.

PRICE 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing.

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God an Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Entheism, the Monistic Conception of God.

DEFINITIONS EXPLANATORY OF THE POSITION OF
"THE OPEN COURT."

THE DATA of experience are perceptions.

REALITY is the sum total of all that is.

TRUTH is the conformity of cognition to reality.

[Truth being a relation between subject and object appears to be relative in its nature. Absolute truth is a self-contradiction; it would imply cognition without a cognizing subject.]

At the same time it is obvious that absolute existence (in fact everything absolute) is impossible. Reality is properly called *Wirklichkeit* in German, derived from *wirken*, to take effect. Reality is not immovable and unchangeable absoluteness, but the effectiveness of things in their relations. Reality therefore implies not only existence, but the manifestation of existence also. Existence and its manifestation are not two different things; both are one.

The idea of something absolutely Unknowable is therefore also untenable; it would imply the existence of an object whose existence is not manifested *i. e.*, existence without reality; *Sein ohne Wirklichkeit*—which is a contradiction, an impossibility.]

SCIENCE is the search for truth.

The nature of science is the economy of thought. (*Mack.*)

Economy of thought is possible through application of the laws of form to thought.

KNOWLEDGE is the possession of certain truths.

[Knowledge is, so to say, the present stock or capital with which Science works. Science cannot exist without knowledge. The object of Science is not only to increase and enlarge knowledge but also to purify the present stock of knowledge from vagueness, errors, and misconceptions.]

The purpose of knowledge is that of increasing our power over nature.]

MONISM is that philosophy which recognizes the oneness of All-existence, and the Religion of Monism teaches that the individual, as a part of the whole, has to conform to the cosmical laws of the All.

RELIGION is man's aspiration to be in unison with the All.

[Religion has been defined differently in the columns of THE OPEN COURT, but all definitions that have been presented are in strict agreement. Mr. Hegeler in No. 25, defines Religion as "man's union with the All" (taking the definition from the Lutheran Catechism "Religion ist der Bund des Menschen mit Gott durch Gott," and replacing the Word GOD by the more comprehensive word THE ALL). The editor has defined Religion as "man's consciousness of his relation to the All" (No. 24); as "Das Allgefühl im Einzelnen," the All-feeling in the individual (see

foot-note page 965); as "man's conception of the world that serves him as a guiding-star through life" (page 1180).]

MORALS are man's conduct in so far as it is in unison with the All.

[The basis of morality is religion. A moral educator or preacher may justly be asked, "On what authority dost thou justify thy precepts?" And he will tell us that his authority is not personal; he speaks in the name of universal order. Accordingly his authority is that of religion. If it were not so, all his good precepts would have no foundation; they would hover in the air like beautiful dreams that have no reality.]

ETHICS is the Science of Morals; it teaches man why he must, and how he can, regulate his conduct so as to be in unison with the All.

Natural history and the history of mankind prove that here on earth a constant progress takes place developing ever higher forms of existence.

Morally good are those acts which are in harmony with the All, *i. e.*, those which enhance progress, and *morally bad* are those which are not in harmony with the All, *i. e.*, those which retard or prevent progress.

[Religion (man's aspiration to be in unison with the All) has naturally produced many superstitious notions in the world, of its origin, and of its purpose. Similarly, science (man's search for truth) has produced many errors or false notions of reality. But all the superstitions of religion do not prove that religion as such is an illusion, and all the errors of science are no evidence that science as such is a sham.]

It is obvious that religion and science, as here defined, are not contradictory to, but complementary of, each other. If religion and science do not agree, it is a certain sign that our conception of either the one or the other is wrong. The history of the human mind has been one of constant conflict and reconciliation between religion and science. Their relation has repeatedly been disturbed and re-adjusted.

The unitary conception of the world affords the only basis for the union of Religion and Science, and opens a new vista of progress for both.]

RECENT CONTENTS OF "THE OPEN COURT."

THE RISE OF THE PEOPLE OF ISRAEL.

[A masterly sketch of the history of Israel's people in the epoch of national organization; marked by critical acumen and a love of truth. The author, PROF. CARL HEINRICH CORNILL, is an orthodox theologian, of Königsberg, Germany. (Nos. 90, 91, 92.)]

THE SITAHARANAM; OR, THE RAPE OF SITA.

[A charming tale of ancient Hindu life; a typical selection from Sanskrit literature. Translated from the original text by PROF. ALBERT H. GOULDING. (Nos. 90, et seqq.)]

THE TRANSIENT AND THE PERMANENT IN THEODORE PARKER.

[A Discourse held at the dissolution of Parker's society, by MONCURE D. CONWAY. Interesting personal reminiscences, historical, literary, educational. (Nos. 91, 93, 94.)]

THE PHYSICAL BASES OF PERSONALITY.

[The second of a series of essays by the eminent French psychologist, TH. RIBOT. Translated with his consent from the "Diseases of Personality." An important contribution to modern psychology. (No. 93.)]

THE WORKINGMAN'S DOLLAR.

[By WHEELBARROW. A sound discussion of an economical question now engaging the attention of all. (No. 93.)]

THE ELECTRICAL EXPERIMENTS OF PROF. HERTZ.

[The electrical researches of Prof. Hertz, of Carlsruhe, form one of the most important contributions to modern science. They show that electricity acts in the same way and according to the same laws as light and radiant heat. (Nos. 95 and 97.)]

PAYMENT IN PROMISES TO PAY.

BY WHEELBARROW.

It is generally conceded that a promise by one man to pay another a hundred dollars is not payment, but there are some persons who believe that "Government" has the magic power to pay ten thousand million dollars with its own promises to pay. They even expand the miracle so that a citizen debtor can pay his debts by the simple "tender" of one of those promises of "Government." Several gentlemen who believe in this impossible alchemy have criticized my doctrine of dollars, with tart sarcasm which reminds me of crab-apple vinegar. I will turn the other cheek to them by a few words in reply. I will first notice Mr. Albert of Kentucky.

Mr. Albert abandons his former position. He admits that he was wrong on his law point, and he changes his argument as to the work performed by government in balancing the value of gold and silver dollars. In his first criticism he said that the American grocer could buy as much coffee in Brazil with the silver dollars he receives in payment for it here as with gold dollars, because "he exchanges his paper or silver to the government at a nominal discount to cover the transfer, and receives gold in return." Being shown his mistake he now says that the government "does not do it directly, but indirectly, by receiving gold, silver, or paper at the same value and indiscriminately for taxes and duties." "Upon this hint I spake," said Othello, and I think that Mr. Albert spoke those words on a hint from me, but they must vexatiously entangle him because in the preceding sentences he impressed it upon me that "paper shall not be accepted in payment of duties." This, he was careful to remind me, is printed on the reverse side of the greenbacks themselves. Mr. Albert calls my arguments "nebulous." No doubt they are nebulous to him, and so I fear is every kind of knowledge, for his brain is wrapped in clouds; yet he frankly admits that he is "a well-informed man."

How queer it is for "a well-informed man" to say that "a promise to pay without any specified time for payment is of no value," and that "nominal value is a term unknown in political economy, for it cannot be defined." I confess, as Mr. Albert kindly says, that it is a subject of which I know little. I have had no

time to study political economy, but in the few books on the "dismal science," which it has been my privilege to read, the term is often mentioned, and this must be my excuse for using it. Jevons on "Money," page 75, treats of the distinction between the *metallic* value and the *nominal* value of coins. The statutes of the United States frequently speak of the "*nominal* value" of the money we are using now. It is a pity that our statesmen should have been so ignorant as to speak of "nominal value" in the very laws of the land. Had they consulted "a well-informed man" he would have warned them that "*nominal* value is a term unknown in political economy for it cannot be defined."

A critic who makes those fundamental mistakes is not entitled to any further reply. We cease to discuss the rules of rhetoric with a man as soon as we discover that he has not yet mastered the alphabet; so the man who shows that he has not yet learned the alphabet of finance is not entitled to the tribute of argument which we extend to a capable disputant. I must decline therefore to notice the rest of Mr. Albert's errors, except incidentally in my reply to that comical person, Mr. J. Allen, of Wyoming Territory, who has danced into the controversy looking very much like little Breeches in the poem, "peart, and chipper, and sassy."

Once upon a time a pugnacious Arkansaw traveler came suddenly upon a very exciting tournament. Goaded by a love of glory, he inquired, "Is this a free fight?" They told him it was. "Count me in," he said; and in he went. After the lapse of a minute and a half, he again remarked, "Is this a free fight?" They answered, "Yes." "Count me out," he said, and left the meeting without waiting for the benediction. Mr. J. Allen rushes with kindred bravery and want of discretion upon a like experience. He knows little enough to say that "'Wheelbarrow' entirely overlooks the real cause of the depreciation of silver dollars; it is nothing more nor less than the lack of the legal tender qualification necessary to make it a bona-fide dollar." He has not yet got far enough in his alphabet to know that silver dollars *are* a legal tender, and yet he has the nerve to criticize and explain the American financial system.

A finance critic who does not know that the silver

dollars of his own country are a legal tender could hardly be historically accurate, and he is not to be held responsible for the following mistake: "The first sixty million dollars of greenbacks issued by this government were a legal tender in the payment of all dues, and were in no sense based upon gold, and a better money was never uttered." Now, it is a curious fact that this celebrated sixty million dollars was not legal tender at all. Of course, the good or bad character of those dollars is a matter of opinion. Mr. Allen thinks "a better money was never uttered." I think worse money has been uttered, but that was very bad. Speaking of that famous sixty millions, the American Cyclopædia makes the following flattering remarks. It says, those notes "did not enter freely into circulation, and there were instances of soldiers having to submit to the loss of a discount on those received for pay of from four to twenty per cent. in the District of Columbia." "Better money was never uttered," says Mr. Allen, although, at Washington, where it was made, soldiers paid in that money for defending the Capitol itself, were cheated by it from four to twenty per cent.

Listen to this: "A nickel," says Mr. Allen, "which is neither gold nor silver, *nor redeemable in either*, will purchase just as much coffee as five cents in silver." Here, again, he reasons upside down. The nickel does that just because it *is* redeemable. On that subject I find in the Revised Statutes of the United States the few feeble remarks following, that is to say:

"The five-cent and three-cent copper nickel, and one-cent bronze coins shall be a legal tender at their *nominal* value for any amount not exceeding twenty-five cents in any payment, and

"The Secretary of the Treasury is required to redeem in lawful money all copper, bronze, copper-nickel, and base metal coinage of the United States."

The faith of the people that they will be redeemed according to the promise of the law gives them currency, exactly as faith gives value to milk tickets. This morning I was roused from slumber before daylight by the milkman "rapping, rapping at my chamber door." I got up and let him in. He gave me a quart of milk, and I gave him a paper ticket, about the size of a silver dollar. At certain times I buy a dollar's worth of tickets, and file them away for use when wanted. These tickets are not milk, they are merely securities redeemable in milk. Although they are not "*legal tender*" I have faith in them, because the dairyman has never failed to redeem them at their *nominal* value, a pint of milk for a red ticket, and a quart for a yellow one. If he should fail in business, my milk tickets on hand would be like the paper money of a broken government—worthless. But the metal money of a country up to its full bullion value, never fails. The coins of Alexander the Great have survived a hundred nations, and are good to-day.

The promise of redemption gives the greenbacks value. This promise is not only printed on the face of them, but has been solemnly written by Congress in the law of March, 1869. It contradicts the assertion that they are dollars, and this denial has been enrolled among the judgments of the Supreme Court of the United States. That tribunal has decided that,

"The dollar note is a promise to pay a dollar, and the dollar intended is the coin dollar of the United States. These notes are obligations, they bind the national faith. They are therefore strictly securities."

On that principle greenbacks are exempt from taxation. The Supreme Court has decided that also, on the ground that they are not dollars, but merely securities of the United States, and therefore not taxable either by the nation, or by any city, or county, or State.

I feel like making an apology for degrading controversy by answering the statement of Mr. Allen that if the world were to demonetize gold, a gold dollar would be worth only five cents, and the equally wild assertion that it would be worth about fifteen cents if the United States were to demonetize gold. The American gold dollar contains 25.8 grains of gold. According to Mr. Allen the value of the metal is fifteen cents, and the United States by coining it into a dollar adds an extra value to it of eighty-five cents. Do I not owe an apology to the reader for noticing such exuberant error?

Coinage adds the merest trifle to the value of the metal coined. This is proven by the fact that gold bullion is nearly equal in value to the same quantity of gold in eagles or in sovereigns. I think the four hundred shekels of silver paid by Abraham for the field of Machpelah were not coins, for they were *weighed*, not *counted*, and yet they were "current money with the merchant." When the sons of Abraham passed under the dominion of Rome, and those shekels bore the "image and superscription" of Cæsar, their value relatively to the other silver round about them was not changed. The coining of them simply dispensed with the trouble of weighing them. The "image and superscription" merely said to the merchants, "You need not weigh this piece; Cæsar hath already weighed it, and vouches that it contains so many grains of silver." And wherever those shekels are to-day, whether in shillings or in dollars, whether bearing the image of Queen Victoria, or our own Goddess of Liberty, the "image and superscription" upon them only testify to their weight. Whatever additional value they obtain by reason of their "*legal tender*" quality, is a dishonest value, the measure of their usefulness in cheating creditors and poor men out of their wages.

There is a playful innocence in Mr. Allen's fairy-

like vows of what he would do with gold and silver had he the power. He would reverse the laws of the universe, and make water run up-hill instead of down. He would demolish what he calls the "idol" gold, and erect a paper "idol" in its place. He would make gold inferior to silver, and then "base both of them upon a paper standard, making them redeemable in United States Treasury Notes, and then demonetize both of them." Many similar miracles he would perform by the same power. All this is like the boasting of the poetical child, who delights us with airy promises of what impossible things he would do if he were King of France.

THE ELECTRICAL EXPERIMENTS OF PROF. HERTZ.

BY THOMAS J. MCCORMACK.

II.

THE experiments cited in No. 95 under the title "Production of Electrical Rays," offer conclusive evidence that an electric oscillation is propagated in space as a form of wave-motion. We found that the interposition of a screen produced phenomena of reflection; nodes and loops of vibration were discovered; the reflected waves *interfered* with the forward traveling waves. But the laws of reflection may be more perfectly illustrated than by the production of phenomena of interference. It was found possible, namely, to separate the incident and the reflected wave-systems. The following was the method employed.

The two concave mirrors were so stationed with reference to each other that their openings faced in the same direction and their axes converged at a point about three metres distant. Of course no sparks were evoked in the spark-transit of the receiving mirror. Thereupon a level, vertical screen, of thin sheet-zinc, 2 m high and 2 m wide, was placed at the intersection of the axes in a position such that it stood at right angles to their median line. A brisk stream of sparks was received, which was produced by the ray reflected from the screen. When the screen was turned about its vertical axis some 15° out of its proper position to the one side or the other, the sparks vanished. Consequently, the reflection is regular and not dispersive. On moving the screen away from the mirrors, while still keeping the axes convergent upon it, the sparks slowly fell off. But even at a distance of ten metres, the sparks were still perceptible; the waves having thus had to travel a path of some twenty metres. This arrangement, Hertz remarks, might be advantageously employed in comparing the velocity of propagation in air with the less rapid velocities of propagation in other substances, as, for instance, in cables.

To obtain a reflection of the ray at an angle of incidence varying from zero, the ray was conducted through a hallway along a partition-wall through which

led a folding-door. In an adjacent room into which the door opened, the receiving mirror was placed; its optical axis passing through the centre of the door and cutting the direction of the ray at right angles. The level conducting screen was then so stationed, vertically, that it formed both with the ray and the axis of the receiving mirror an angle of 45° . At once a stream of sparks was excited in the secondary conductor which even the closing of the door did not interrupt. When the reflecting screen was turned some 10° out of the proper position, the sparks disappeared. The phenomenon is therefore regular in its action and the angles of incidence and reflection equal.

By placing shadow-casting screens at the various points in the line of the path, it was shown that the ray could only travel from the source of the disturbance by way of the level mirror to the secondary conductor. In every instance here, the secondary sparks vanished; whereas the screens when placed at points in the remaining space did not intercept the ray.

REFRACTION.

When a ray of light passes obliquely from a rarer to a denser or from a denser to a rarer medium, it does not continue in the prolongation of its path, but is deflected from its course. This phenomenon is called refraction. It follows a definite law. The angle of incidence always bears a constant relation to the angle of refraction; this constant relation is known as the index of refraction.

To ascertain whether a ray of electricity in passing from the air into an insulating medium, suffered refraction, Hertz caused a large prism of mineral pitch to be constructed.* The basal surface was an equilateral triangle, the sides of which measured 1.2 m; the angle of refraction was nearly 30° ; the height of the prism, with the refracting edge vertically placed, was 1.5 m. The prism was laid upon a proper foundation at a height such that the centre of its refracting edge lay at an equal altitude with the primary and secondary spark-transits. Hertz first assured himself that a refraction took place, and after having attained an idea of its magnitude, instituted the following experiments.

The emitting mirror was brought, at a distance of 2.6 m, to a position facing the first refracting surface, and so stationed that the axis of the ray lay accurately directed toward the centre of gravity of the prism and struck the refracting surface at an angle of 65° from the direction of the posterior surface. By the side of the refracting edge of the prism and by the side of the surface opposite, were placed two conducting screens

* The prism weighed about twelve cwt. Since it would not have been easily manageable as a whole, it was cast in wooden boxes into three equal parts, 0.5 m in height; the boxes were left about the prisms, their presence not affecting the action of the ray.

which cut off every other passage for the ray except that through the prism. On the side of the transmitted ray a circle of 2.5 m radius was drawn upon the floor, about the centre of gravity of the base of the prism as centre. In this circle the receiving mirror was then so moved about that its aperture was continually directed towards the centre of the circle.

When the receiving mirror was placed in the line of the prolongation of the incident ray, no sparks were received; the prism threw a total shadow in this direction. But sparks were evoked when the mirror was pushed in the direction of the posterior surface of the prism; first appearing at the point where the angular displacement from the original position, as measured in the circle, amounted to 11° . The stream of sparks increased in intensity until an angular deviation of about 22° was reached, when they again fell off. The last were obtained at a deflection of about 34° .

When the mirror was placed in the direction of the greatest effect and moved backwards from the prism on the radius of the circle, the sparks could be followed to a distance of 5-6 m. Hertz's assistant, by taking his position before or behind the prism, caused the sparks unmistakably to disappear—a proof that the effect actually passed through the prism and was not transmitted by any other path to the secondary conductor.

Again, without altering the position of the prism, the focal lines of the two mirrors were horizontally placed, and the experiments repeated in this position. No variation from the experiments described was noticed.

The refractive index corresponding to a refracting angle of 30° and a deflection of 22° near the minimum of deflection, is 1.69. The optical refractive index for pitchy substances is given at 1.5 to 1.6. The inexactness of Hertz's determination and the impurity of the stuff employed does not admit of a great importance being attached to the amount and significance of the discrepancy.

POLARIZATION.

The ether particles in a ray of light oscillate transversely to the line of propagation. Ordinarily they move in all directions about the line of propagation. But under certain circumstances all the vibrations may be reduced to one common plane. In the latter case the ray of light is said to be *plane polarized*.

The property of polarization may be acquired by reflection. When light at a certain angle of incidence falls upon a reflecting surface, all the vibrations of the rays reflected occur in a common plane. If such a polarized reflected ray fall upon a second reflecting surface, it will again suffer reflection provided the

planes of reflection of the two surfaces are parallel; if they are at right angles to each other the ray will be quenched. In this instance the two surfaces, or mirrors, form a *reflecting polariscope*; the first mirror is a polarizer, polarizing the light, and the second an analyzer, determining its properties.

Now the manner in which our ray of electricity in the experiments cited, was produced, shows unquestionably that the ray is formed by transverse vibrations and that it is plane polarized, just as a ray of light is. The following experiment will convince. Let the receiving mirror be turned about the ray as axis, until its focal line, and with it the secondary conductor, comes into a horizontal position; the secondary sparks will gradually disappear and when the focal lines of the two mirrors are horizontally crossed, none are visible—even though the mirrors be brought very near each other. The two mirrors act as polarizer and analyzer of a polariscope; the ray of electricity is quenched—just as in the polariscope, when the plane of reflection of the analyzer is at right angles to the plane of reflection of the polarizer, the ray of light is quenched.

Polarization may occur by refraction. Light passing through certain substances does not follow the ordinary law of refraction. In Iceland spar an incident ray is split into two: it is said to be doubly-refracted. Doubly-refracted rays are also found to be polarized; that is, their vibrations occur in a common plane. In tourmaline, which is likewise a birefractive substance, that ray only is transmitted whose vibrations are executed *parallel to the axis* of the crystal. Consequently, if a ray of light impinge upon two superposed plates of tourmaline, the ray will pass unaffected if the axes of the two plates are parallel; so also if they are oblique to each other, for then the ray is resolved into two components, *one* of which is parallel to the axis. It will, accordingly, be seen, that if where the axes of two plates of tourmaline lie perpendicular to each other, in which case there is darkness, that light will appear if a third plate be obliquely introduced between them. For the light is twice resolved, and in each case *one* of the resolved components is parallel to the axis of the tourmaline plate. The two tourmaline plates are a simple form of the so called polariscope; the first plate is the polarizer and the second the analyzer.

To illustrate the phenomena of polarization described, Hertz constructed an octagonal wooden frame, 2 m high and 2 m wide, strung with copper wires 1 mm in thickness; the wires were parallel to each other, and each was 3 cm apart from the adjacent ones. The two mirrors were then set up with parallel focal lines, and the wire screen was so placed between the two, in a position perpendicular to the line of the ray,

that the direction of the wires cut the direction of the focal lines at right angles; in this case, the screen did not perceptibly affect the secondary sparks. But when the screen was so introduced that its wires lay parallel with the focal lines, the ray was totally intercepted. With regard to the transmitted electrical energy, therefore, the screen in this instance acts towards the ray precisely as a plate of tourmaline towards a plane polarized ray of light.

The focal line of the receiving mirror was again brought into a horizontal position, when, as before, no sparks appeared. The result was the same, when the screen was introduced, so long as the wires were either vertically or horizontally placed. But if the frame was so stationed that in the either of the two possible positions, its wires were inclined 45° to the horizontal line, the effect of introducing the screen then was the production of bright sparks in the secondary spark-transit. Plainly, the screen resolves the incident vibration into two components, and permits only that component to pass which falls at right angles to the direction of its wires. This component is inclined at an angle of 45° to the focal line of the second mirror, and, resolved a second time by the mirror, is able to act upon the secondary spark-transit. The phenomenon is throughout the same as the illumination of the dark field between polarizer and analyzer of a polariscope by an obliquely introduced plate of tourmaline.

A further distinction is to be noted here. "We are able," says Hertz, "by the means employed in the present investigation, only to detect electrical force. The electrical vibrations, when the primary oscillator is placed in a vertical position, take place unquestionably in the plane passing vertically through the ray, and are not present in the horizontal plane. From the experiments made with slowly alternating currents, on the other hand, there is no doubt that the electrical vibrations are accompanied by vibrations of magnetic force, which occur in the plane passing horizontally through the ray and do not appear in the vertical plane. The polarization of the ray, accordingly, does not consist so much in the fact that vibrations take place only in the vertical plane, as, rather, that *the vibrations in the vertical plane are electrical, and those in the horizontal plane magnetic, in character.* The simple question, in which of the two planes of a ray the vibration takes place, without stating whether the inquiry is for magnetic or electrical vibration, admits of no answer.

* * *

Returning now to the last experiment upon reflection, Hertz found it possible by the aid of the circular secondary conductor to determine, in the ray, the position of the plane of undulation. Both before and after reflection from the level screen it lay at right an-

gles to the ray and had consequently described, in the reflection, an angle of 90° .

In the experiments upon reflection hitherto described, the focal lines of the concave mirrors stood in a vertical position, and the plane of oscillation was at right angles to the plane of incidence. In order to produce a reflection in which the oscillations would be performed *in* the plane of incidence, Hertz placed the focal lines of the concave mirrors in a horizontal position. The same phenomena as in the former position were observed and no difference even of intensity was noticed in the ray in the two instances. But, if the focal line of one of the mirrors is vertical, and that of the other horizontal, no secondary sparks whatever are seen. The conclusion was, that the inclination of the plane of oscillation to the plane of incidence was not changed by the reflection so long as the inclination is of one of the preferred values mentioned. But universally this statement does not hold good. "It is questionable," says Hertz, "whether after reflection generally the ray is still plane polarized."

A further experiment may be mentioned, with regard to reflection from electrically anisotropic surfaces. The two concave mirrors were placed as in the first described experiment on reflection; their openings faced in the same direction and their axes converged at a point three metres distant. But at the point of intersection of the axes, in this instance, was placed, as reflecting screen, the octagonal frame of parallel copper wires already mentioned. The result was that when the wires cut the direction of the vibrations at right angles, the secondary spark-transit was not illuminated, but was lit up as soon as the wires coincided with the direction of the vibrations. The analogy between the partially conducting surface and the plate of tourmaline is limited, accordingly, to the part of the ray that passes through the screen. The part that does not pass through is absorbed by the plate of tourmaline but reflected from the surface here employed. If the focal lines of the two mirrors, in the experiment last described, be crossed, it is impossible by reflection from an isotropic screen to evoke sparks in the secondary conductor. Hertz was convinced, however, that by reflection from an anisotropic wire-screen sparks could be called forth; provided the screen were so placed that the direction of the wires was inclined to the two focal lines at an angle of 45° . This phenomenon is clearly explainable from what has been said with regard to the action of a ray of light transmitted through three tourmaline plates.

* * *

"The physical formations just investigated," says Hertz, "we have introduced as rays of electrical force. We may, after what we have seen, designate them perhaps, as optical rays of very great wave-lengths. I,

at least, regard the experiments cited as in high degree calculated to remove all doubt regarding the identity of light, radiant heat, and electro-dynamic undulatory motion. I believe that scientists will now be able confidently to profit by the advantages that the acceptance of this identity ensures for the theory of optics as well as the theory of electricity."

DILETTANTEISM IN LITERATURE.

THERE are two classes of artists, *Virtuosi* and *Dilettanti*. The *Virtuosi* are professional artists who have studied and learned their art, and who practice it to make a living. They are, as a rule, skilled in their profession and other folks gladly pay them for the privilege of enjoying their work. *Dilettanti*, however, practice art not for the purpose of gaining a livelihood, but for their own amusement. That which is serious work to the former, is to the latter mere play and pastime.

Virtuosi pursue their calling (whatever it be, music, painting, or poetry) for the sake of gain, but *Dilettanti* from pure love of art. *Virtuosi*, being obliged to study and struggle in order to keep abreast with the general progress, practice their art constantly to the terror of themselves and to the enjoyment solely of others; while *Dilettanti*, we are told by *Virtuosi*, labor merely for their own amusement and eminently to the terror of others.

This, being true of art, applies with full force to literature, and we may add that the shortcomings of both classes, of the *Dilettanti* and the *Virtuosi*, are more injurious here than even in music, which is the most intrusive of the arts.

It is but fair that authors and artists should earn for their work a well deserved share in dollars and cents. But they are the prophets of humanity, they deal in the highest treasures of our race, and although, like the priests of religion, they should receive payment for their services, they should not attend to their work for the sake of money and still less should they yield to the temptation of following a vulgar taste which pays well. A manufacturer who produces, and a merchant who palms off on his ill-bred customers the patterns of their *mauvais goût* may be excusable; a poet or an artist who lowers himself in this way for the sake of gain justly deserves our contempt. He profanes the holiest ideals and instead of elevating his fellow-beings, he poisons their imagination and retards their progress.

Mercantile art and literature has lost its title to nobility; it becomes obnoxious and will easily be made serviceable to low purposes.

Such are the faults to which the work of *Virtuosi*, of the professional caste, is often subjected, if they become slaves of lucre, be it from poverty or from

greed. In a country, however, where the moral spirit is a living presence we need not be afraid of any deterioration in art and literature since encouragement to a depraved taste would be too slight to recompense a sacrifice of the nobler aspirations of higher ideals.

The dangers that threaten art and literature from dilettanteism appear less injurious, but may become just as bad by a luxuriant growth of a semi-civilization springing from the rich soil of uncultured wealth. The *Dilettante*, as a rule, is a harmless person so long as he knows his imperfections. He keeps his paintings or poems in his desk, and if he is a musician, plays his piano in solitude. But let him be a man of influence, and he too easily receives the praises of his so-called friends and is thus inveigled into inflicting his crude productions upon a patient world. A country in which many *Dilettanti* of this kind prosper, will suffer no less from it than another country may from mercantilism. Let the general taste of a country be moral in its nature but indiscriminate, and these *Dilettanti* will prove to be the thorns amid which the good seed will be smothered.

The danger of dilettantism is not that of immorality but of ignorance; and ignorance, especially if it lies within our power to mend it, is also a vice; at least the consequences of both are the same. *Dilettanti* in literature not only fill the world with their verses, but they venture into all fields. They not only write on philosophy, on theology, on economics, on psychology, and worst of all on *belles lettres*, but they are bound to have their productions published. They have no idea that in order to write on a subject they should be familiar with the literature of their topic. They do not care for that which has been proposed by others on the subject. The less they know the more original they conceive themselves to be, originality being the chief aim to which they aspire.

For the benefit of *Dilettanti* in literature, it must be stated that their work will perhaps be very useful for their own education and self-training, but in so far as the world at large is considered, they will contribute little or nothing to the progress of humanity. And if indeed something good come out of this Nazareth, it will be an exception.

And why?

Ideas in philosophy, in science, and in literature cannot be created from nothing; they develop like living organisms. In order to make a new scientific discovery, one must be familiar with the existing state of scientific research. Archimedes with all his genius could not have invented the phonograph; but very likely he would if he had had all the knowledge of Mr. Edison. It is obvious, accordingly, that certain discoveries and inventions lie as it were in the atmosphere and are often made simultaneously by two dif-

ferent men who know nothing of each other's labors. Thus the differential calculus was invented by Leibnitz and by Newton; the nebular hypothesis by Kant and La Place; the idea of the common descent of all animals through evolution, by Treviranus and La Marck. It is not the man who out of his own genius, from the depths of his soul, brings forth the new ideas; it is the old ideas that enter his mind and are there transformed so as to be reproduced in a maturer and truer shape. Accordingly, if we intend to contribute to the general progress of mankind, we must first acquire the present store of knowledge. If we believe that we are such geniuses as to be able to do without it, we shall (if we have sufficient intellectual strength) at best make discoveries that have been made centuries before us. We never heard of them; how can we know that they have been refuted long ago and are now replaced by other and more advanced views?

Virtuosi have the advantage of being in possession of the acquisitions of mankind in their branch, but they often suffer from being educated in a certain school, from having imbibed all the prejudices of a one-sided partisan conception. Most Dilettanti are free from the effects of a misguided training. Therefore they are usually more open to progress, and it happens frequently that a Messiah comes from out their ranks—instead of appearing in the class of the recognized professional Virtuosi. Such was the case with Wagner who describes his life in the *Meistersinger* where Walther introduces new lays; he is rejected by the professional class of *Singers*, but the old master Hans Sachs recognizes in him the genius of a new epoch.

It need not be said that if a prophet indeed arises from the Nazareth of dilettanteism, he must first pass through the severe school of self-education in order to raise himself to the present level of his craft. Being, however, independent in his work, he preserves a freshness of mind which most of his professional co-workers lack. He is not ensnared by the time honored prejudices of the guild and not imposed upon by venerable masters, whose authority, justly deserved in other respects, gives strength to their errors. While most of the professional class are so well versed, so stable in the methods of their craft, that their brain nerves have become ossified, he remains impressive and impartial. His judgment is not pre-captured, not secretly pledged to or predisposed for the old theories, and this virginity of his mind renders him fit to create new theories and progress beyond the present state.

That which is most desirable, therefore, is neither the orthodox and fossilized wisdom of the professional Virtuoso, nor the sportive levity of the Dilettante, but a combination of the virtues of both without their

offensive faults. The workers of humanity that labor in the mines of man's intellectual life, must perform their task from pure love of their work, not for mere enjoyment, but with unerring, unflinching earnestness, and zeal.

P. C.

INFIDELITY.

BY DR. R. B. WESTERBROOK.

[From the *Freethinkers' Magazine* for July.]

“WHAT is infidelity, and who may with propriety be called infidels? The words *infidel* and *fidelity* are from the same Latin root, *fidelis*. In the former the prefix *in* (not) is used while in the latter it is omitted. The original, *fidelis*, means *faithful*, from *fides*, faith. The word faith does not primarily and necessarily refer to what one believes, but to his *fidelity* to whatever he believes. The more comprehensive and practical meaning of the original word relates specially and primarily to the matter of faithfulness to a *trust* or contract, and hence, in the language of the law, adultery is denominated “*infidelity*,” because it is a violation of the marriage contract. By palpable perversion of language, and doubtless out of deference to ecclesiastical bigotry and arrogance, lexicographers have added to the original and real philological meaning of the word an arbitrary and utterly unjustifiable definition, founded entirely upon the puritanic *usus loquendi*, and applied it to the matter of a *creed*, what one *believes* regarding the dogma of a single *sect*, as to the infallible inspiration of its doubtful Scriptures—doubtful as to their origin, doubtful as to what they really teach, and equally doubtful as to the real character and teachings of the alleged founder of the sect. Against this perversion I firmly protest and refuse to be called an *infidel* until I shall have been proved *unfaithful* to a *trust*. According to the real meaning of the word, I would as soon be called a *defaulter* as an *infidel*.

“In my judgment independent investigators and freethinkers have not been wise in tacitly accepting an opprobrious name without an earnest denial and an indignant retort. No class of men on earth are more free from *infidelity* than those who are vilified as infidels by those to whom the stigma properly belongs. In behalf of the Rationalists and Liberals of the world, I flatly deny that they are *infidels*, and boldly retort by charging the rankest *infidelity* upon the paid, professional Christian clergy, with few exceptions, in that they are *unfaithful* in the search for truth, often suppress it when they happen to find it, and as frequently suggest the false, and even *unfaithfully* and dishonestly preach what they do know to be false! Such men are the real infidels.

“I close with a kindly hint to some of our ration-

"alistic writers and speakers who sometimes use the "expression 'orthodox infidelity,' or similar words. "Herein I think our 'Homers' are caught 'nodding'!" "Has it come to this that there are men in our *Liberal* "ranks who are not only willing to be stigmatized as "infidels, that is, as *defaulters* and *unfaithful* persons, "but tacitly admit that they belong to a *SECT* having "a 'shibboleth' or standard of orthodoxy like other "sects? Can it be true that some *Freethinkers* cannot "tolerate *free-thinking*? Let Liberals beware lest "they fall into the secret snares of the narrow bigots "who 'profess and call themselves *orthodox* Chris- "tians"! Let Freethinkers have no tests of 'good "and regular standing' except those of moral char- "acter, manly honor, and mental freedom."

THE SITAHARANAM; OR, THE RAPE OF SITA.

AN EPISODE FROM THE GREAT SANSKRIT EPIC "RAMAYANA."

TRANSLATED INTO ENGLISH BY PROF. ALBERT H. GUNLOGSEN.

V.

Now the younger Raghuid, after thus having rudely been provoked, proceeded in the direction of Rama, leaving Sita alone in the forest.

But Ravana, perceiving how both Rama and Lakshmana had been enticed away by Maritcha, began now to consider, how his own purpose could best be attained; although the dutiful Lakshmana, reluctant and bewildered, did not venture to advance very far.

In the meanwhile he, the majestic Dasagriva,* commenced moving toward the daughter of Videha, in the disguise of a mendicant penitent. He beheld the fair girl forsaken in the wood, left there alone by the two brothers, like twilight and dark night, deprived of their sun and moon.

The foolish lord of the Rakshas, on seeing the matchless woman thus lonesome, began to think with himself, that this would be the right time for approaching her during the absence of her husband and Lakshmana; and having quickly bethought himself, Ravana suddenly stood before Sita in the disguise of a wandering Bhikshu.†

He was clad in the brown garment of his order, wearing the prescribed lock of hair on the top of his head, with an umbrella and sandals; a sack was slung across his left shoulder, and in his hands he carried three bamboo-sticks, and the earthen jar for collecting alms.

Then all trees and plants growing in the wood of Janasthana, all birds and beasts at the sight of the

fiend were paralyzed with terror; the winds were hushed into calm at the swift approach of the lord of all Rakshas, bent on cruel mischief, and the river Godavari ceased to flow. And then also in the neighboring Pantchayatya-forest* all birds and deer fled off in wild terror, Ravana in the meantime having come within sight of Rama's abode. The wicked fiend, thus, in his disguise of a wandering Bhikshu approached the beautiful Sita, immersed in grief at her husband's prolonged absence. He accosted the daughter of Videha, ill-concealed under his disguise, as a well by treacherous brambles; or not unlike the slow planet Saturn, when he moves toward the chaste star Tchitra.‡

Ravana stopped and fixed his glance on Sita, the spotless wife of Rama, of the beautiful teeth and lips and lovely like the full moon.

She was sitting within a bower of leaves, shedding copious tears, abandoned by Rama and Lakshmana—a prey to sorrowful thoughts. In him she beheld the dark, moon-less night, while his covetous eye, though unable to carry hence the charming body of the Videha, remained immersed, and like fascinated at the sight. The evil-minded rover of the night approached still nearer to the Lotus-eyed daughter of Videha, dressed in yellow silk;‡ and wounded by the darts of the god of love, there in the solitude he began to speak to her, counterfeiting the modest tone of a Brahman; for indeed she glowed all over her person like gold or like Sri§—highest goddess in the three worlds, without her Lotus; but now, alas, Ravana began to praise her.

"O you soft-smiling, soft-eyed fair one! You are blooming like the wood yonder before us! Your swelling bosom, in its loveliness matching the choicest pearls, is indeed charming! Who are you, like a golden statue, in your yellow, silken garments, and wearing a wreath of blue Lotus? Are you modesty, renown, the goddess Sri, beauty, the divine Lakshmi|| herself—which of all these are you, O you fair one—you who seem so unfettered and free? Like the pointed mountain-peaks yonder are your pretty, white teeth. Your eyebrows are well penciled, delicate, and a fit ornament to your beautiful eyes. The expression of your countenance is wonderfully enhanced by those cheeks, O you Sundari!¶ They are glowing like beaten gold and naturally charming. Your ears are well-formed, and your delicate hands possess the soft red of a Lotus-leaf; your hair is divided by a parting-line;

* The 'tapovana' of the text properly denotes a wood inhabited by anchorites.

† Tchitra, the foremost star in Virgo.

‡ Yellow was the royal color in India.

§ Sri, Ceres, goddess of plenty.

|| Lakshmi, wife of Vishnu, and goddess of happiness, etc.

* Epithet of Ravana, denoting the one of "ten necks."
 † A wandering Buddhist mendicant. This, of course, is an anachronism. There were no such in Rama's day. At a later time, however, the Brahmans in their hatred of the Buddhist fraternity identified these heterodox mendicants, both male and female, with tramps, impostors, and disreputable characters.

¶ Sundari, name of a goddess. All the oriental epithets bestowed by Ravana upon Sita are not suited to the taste of Western nations, and have partly been omitted and others slightly modified.

your fingers and the palm of your hand are so delicate and divine! And your lovely well-shaped feet in their quick, alternate motion resemble the tender buds of a Lotus-flower; a pair of jet-black pupils are sparkling in your large, pure eyes, O you fair-haired one, and only one hand might easily span your elegant, lithe figure.

I never on earth beheld any goddess, Gandharvi, Kinnari, Yakshi, or any living woman like you. You surpass everything in the world, and your holy beauty will never fade. And yet, my anxiety is aroused at seeing you living in this dangerous wilderness; O may you not for your welfare's sake dwell here! This is the abode of the lawless Rakshas, while lofty palaces, pleasant suburban groves, parks, Lotus-lakes, Indragardens and other enchanted grounds are only worthy of being inhabited by you.

Your Lotus-wreath, your jewels, and dress being all so choice, I should think that your husband must be the same. O may you not stay here, lying on the ground, suffering and feeding on roots in the wilderness—though worthy of joy, yet debarred from all happiness! Who are you then—for unto me you seem a divinity—perhaps one of the Rudras, Maruts, or Vasunas? Unto which of these divinities belong you? Are you indeed a Gandharvi or an Apsaras? * Yet, hither never used to come Gandharvis or Apsaras, neither demi-gods nor men. This is the abode of Rakshas only—so how came you hither? None are here but jackals, lions, tigers, elephants, bears, hyenas, and wolves; and how are you not afraid of all these? And do you not fear to live in this wood amidst gigantic, swift, and furious elephants? Say then, who and whose are you, and whence have you come; for what motive have you alone ventured to invade the dreaded abode of the Rakshas?

In such words the daughter of Janaka was addressed by the evil-minded Ravana. At first she had been startled, seized with fear and mistrust; but the disguise of the Brahman again inspired her with confidence; and Sita accordingly replied to Ravana, disguised as a Bhikshu, but afterwards discovering to her great regret, that a Raksha had entered her dwelling in a penitent's garb. At first Sita honored him with every attention due to the guest, and fetching water from the wood, offered it to him; even speaking a blessing upon the saintly impostor. Ravana, while admiring the graceful princess, bent on his service, at the same time had firmly made up his mind to carry her away by force; he now imagined that he had reached his purpose and beholding her in the solitude anxiously waiting for the return of her husband, who had gone a-hunting and for Lakshmana, alas, he felt deeply satisfied.

* Apsaras, the heavenly dancers; all the other names are also those of demi-gods.

CORRESPONDENCE.

EXTRACTS FROM OUR CORRESPONDENCE UPON THE SINGLE-TAX QUESTION.

To the Editor of THE OPEN COURT:—

I do not wish to champion Mr. Pentecost, or to strike Wheelbarrow over his shoulder, for Mr. P. is amply able to manage his own cause; but, in a friendly way, I wish to show "W." that it is the merest quibbling to hunt for a mare's nest in words that may in a certain sense be synonyms. When ground-rent is taken for taxes, rent and taxes become interchangeable terms. * * * The question is not whether we shall tax or confiscate, for these terms mean the same thing in this connection, but in what proportion shall we take from the individual. Shall we take in proportion to each man's industry or accumulation or in proportion to the land or natural opportunity that the individual owns. * * *

Mr. P. makes a mistake in comparing the legal status of a horse—very properly private property—with land, which cannot be made private property. What the individual requires with land is secure possession, not ownership. The horse thief would laugh at your denial of ownership while leaving the horse in his possession; it is the last thing you would think of doing, but it is the very thing proposed by Georgeites with regard to land—common ownership but private possession.

Permit me, Mr. Wheelbarrow, to remind you of the old saw: "People who live in glass houses should not throw stones." You express it as your opinion that the ownership of land constitutes the political distinction between a freeman and a serf. Such a proposition is so shallow and so transparent that the man who holds it ought never to touch Mr. P.'s glove nor that of any other man who has "seen the cat." Had you thought, beyond the end of your nose, you would have seen that in any country, or under any government, where land is bought and sold freedom becomes a thing of purchase, and not a natural right, and, as we say, "the man with longest purse knows the persimmon."

It is a proposition that no man can dispute, that if either factor of production is made a commodity, slavery is the inevitable result—chattel in the one case, industrial in the other. You can stand upon this proposition as upon a rock, and standing upon it you must accept the single tax. * * *

When I was a young man, scarcely out of the years of my boyhood, I led men to battle and to death fighting for the emancipation of the chattel slaves, and now that our heads are growing grey, I would Heaven we could fall in to emancipate the industrial slaves—our own children. W.M. CAMM.

MURRAYVILLE, ILL.

To the Editor of THE OPEN COURT:—

"WHEELBARROW" still in wordy warfare makes it hard to believe that he finds any real difficulty in comprehending the George theory, or that he can imagine a proposition "to take for the use of the community the whole income arising from the use of (Tom Clark's) land," equivalent to a proposition "to take for the use of the community the whole income of his farm." There may be a mental aberration which corresponds with color blindness and renders its victims unable to distinguish differences that are easily perceived by persons with normal faculties. If "Wheelbarrow" is thus affected he deserves sympathy, but uncharitable people will dismiss his case with the remark that none are so blind as those who will not see.

The income arising from Tom Clark's land is the sum which other men would pay him for permission to work for themselves on this land stripped of buildings, fences, and other improvements, which have been placed upon it by human exertion. The amount

of this income can easily be determined by the local assessors from comparison with neighboring unimproved land of the same natural capabilities and corresponding proximity to population. Their income is rent and this only is what Mr. George proposes shall be taken for the use of the community. The income of Tom Clark's farm is quite another matter. A farm is land in cultivation. Cultivation necessitates labor, and capital increases the efficiency of labor. The crops which Clark produces are the income of his farm. But this income includes the income arising from the application of labor, and the income arising from the use of capital, in addition to the income arising from the land. Mr. George concedes Tom's absolute right to the entire income of the farm, except the rental value of the land as above mentioned. * * *

In Book VIII, Chap. II, Progress and Poverty, Mr. George in plain words proposes "making land common property by confiscating rent" and to "assert the common right to land by taking rent for public uses." For this purpose, he says, "The machinery already exists. Instead of extending it, all we have to do is to simplify and reduce it" so as "to abolish all taxation save that upon land values" and "to appropriate rent by taxation." In a late speech in Manchester, Eng., Mr. George says: * * * "Although in form we propose to substitute one tax for other taxes, yet it is merely in form. * * * In reality what we propose is to abolish all taxation, because the imposition of a tax on land-value would only be in form a tax. In its nature it is but taking for the use of the community the rent which is due to the community." There is no "melancholy deception here." It is all so simple and straightforward that "the wayfaring man though a fool need not err therein."

J. K. RUDYARD.

EAST NORTHPORT, N. Y.

To the Editor of THE OPEN COURT:—

WHILE decrying Georgeism, the ultimate goal of which is the Nationalization of land by means of a single land-tax, Wheelbarrow, who boasts in THE OPEN COURT of June 13th of having demolished Mr. Pentecost by extorting from him the confession that Georgeism involves confiscation, has not a word to say about the practical confiscation of small freeholds such as Thomas Clark's under our present usurious system of taxation and sales for delinquent taxes, constantly going on now all over the United States.

All the difference there is between Wheelbarrow and Henry George and his disciples is simply this: The latter propose to do the identical thing and nothing more for the benefit of the commonwealth what Wheelbarrow and his fellow reformers have been doing all along and are doing now for the private benefit of Lord Wheelbarrow and a few other private individuals who have adopted the "mighty scarce" gold dollars as the standard measure of all values. After all there is some analogy between a slave and a farm, for the hire of the one as well as the other is a source of revenue to its owner, and the abolition of slave labor will surely be followed by the abolition of private ownership in land which is fast reducing free labor to a worse condition of servitude than negro slavery was before the war. * * *

This now irrepressible conflict between vested and national rights is constantly spreading over wider acres and Irish evictions are no longer uncommon occurrences here in free America, the public highways of which are thronged with homeless tramps God made the land for all men to dwell therein and not for but a few to speculate therein and corner it, and how long the American people will rest content to be despoiled of their inheritance by our present land system the Lord only knows.

F. HESS.

GONZALO. I' the Commonwealth I would by contraries
Execute all things; * * * riches, poverty,
Bourn, bound of land, tilth, vineyard, none.
No occupation; all men idle, all.

SEBASTIAN. Yet he would be king on't.—*The Tempest.*

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXVIII. — Continued.

Raschke started up from his chair. Struvelius, whose emotion was only visible in his bristly hair, began: "We were called yesterday to the police-station. When the brother of Magister Knips fled to America, his things were taken possession of on the application of petty creditors, and as the greater portion of his effects were at his mother's house, they were taken away from there. Amongst them were utensils and portfolios which evidently did not belong to the fugitive, but to his brother; one of those portfolios contained tracings after the style of manuscripts, unfinished attempts to imitate old writings, and written parchment sheets. The officials had been surprised at these, and requested me to inspect them. It appeared upon closer observation that the Magister had long been occupied in acquiring the skill of imitating the characters of the Middle Ages. And from the fragments I have found in the portfolio, there can be no doubt that he has other forgeries in his collection, some of which answer exactly to that parchment strip."

"That is enough, Struvelius," began his wife. "Now let me speak. You may imagine, dear colleague, that Werner at once occurred to us, and that we were greatly alarmed lest the husband of our friend should get into trouble through the deceiver. I asked Struvelius to write Professor Werner, but he preferred to inform him through you. This method also appeared most satisfactory to me."

Raschke, without saying a word, took off his dressing-gown, and ran in his shirt-sleeves about the room, searching in all the corners. At last he found his hat, which he put on.

"What are you about, Raschke!" exclaimed his wife.

"Why do you ask?" he said, hastily; "there is no time for delay. I beg your pardon, Mrs. Struvelius," he said observing his sleeves, and again put on his dressing-gown, but in his excitement he still kept on his hat, and thus attired, seated himself opposite his friends. Bertha, at a sign from her mother, gently took his hat off.

"A quick decision is necessary in this case," he repeated.

"There is no reason," continued Struvelius, "for withholding the property of the Magister from his mother; but, meanwhile, they would willingly allow you an inspection of the writings."

"That I do not wish," exclaimed Raschke; "it would spoil the day for me. Your judgment, Struvelius, satisfies me."

* Translation copyrighted.

There was some further excited interchange of views, and the visitors left. Again Raschke rushed stormily about, so that the skirts of his dressing-gown flew over the chairs.

"Dear Aurelia, do not be frightened; I have made up my mind. I shall set out to-morrow."

Mrs. Raschke clasped her hands together.

"What are you thinking of, Raschke?"

"It is necessary," he said. "I despair of shaking the firm views of Werner by letter. My duty is to try whether persuasive words and detailed representations will have greater effect. I must know in what relation my friend stands to the Magister. From certain intimations of the Doctor, I fear the worst from the activity of the forger. I have a short vacation before me, and I cannot employ it better."

"But, Raschke, you wish to travel!" asked his wife, reproachfully. "How can you engage in such an undertaking?"

"You mistake me, Aurelia; in our city I sometimes do loose my bearings, but in foreign parts I always find my way."

"Because you have never yet been alone in foreign parts," replied the prudent wife.

Raschke approached her, and raised his hand warningly.

"Aurelia, it is for our friend, and one must pay no regard to trifles."

"You will never get there," rejoined his wife, with sad foreboding.

"It is much easier to speed through half the world in a secure vessel than to go on two legs through our streets; half acquaintances are the most unreliable."

"Then the money for the journey, Raschke?" whispered Mrs. Aurelia, in a low voice, that the children might not hear.

"You have in your linen cupboard an old black savings-box," replied Raschke, silyly. "Do you think I know nothing of it?"

"What I have collected in that is for a new dress-coat."

"You wish to take away from me my old one?" asked Raschke, indignantly; "it is well that I have made the discovery. I would now travel to the capital even if I had no occasion for it. Out with the box!"

Mrs. Aurelia went slowly, brought the savings-box, and with silent reproach, put it into his hands. The Professor tossed the money, together with the box, into his breeches' pocket, threw his arm round his wife, and kissed her on the forehead.

"You are my own dear wife," he exclaimed; "and now there must be no delay. Bring me Plato and Spinoza."

Plato was the silk cap, and Spinoza the thick cloak of the Professor. These treasures of the house were

so called because they had been bought with the money earned by two books on those philosophers. The impression which the works had made on the learned world had been very great, but the remuneration very small. A commotion arose among the children, for in winter these beautiful articles were sometimes brought out for a Sunday walk. The little troop ran with their mother to fetch them.

"Be sure and bring them back, Raschke. I am so afraid you will lose one of them."

"As I have told you, Aurelia, in traveling you may depend upon me."

"I will write a few lines to Werner; he must take care that you keep them both. I will put the letter in your coat pocket, if you will only give it to him."

"Why not?" exclaimed Raschke, courageously.

The following morning Mrs. Aurelia accompanied her husband to the point from which the coach started and took care that he came to the right place.

"If you were only safely home again!" she said, piteously.

Raschke kissed her gallantly, and seated himself on his traveling-bag.

"The seats are remarkably high," he cried out, with his legs dangling. His traveling companions laughed, and he said, civilly, "I beg the gentlemen to excuse me."

* * *

The lamps burned, and the moon shone through the white mist on the walls of the Pavilion when the Professor returned there. No ray of light fell from the windows. The house stood gloomy and abandoned, and a blue phosphorescence seemed to glimmer above it. The door was closed; the lackey had disappeared. The Scholar pulled the bell. At last some one came down the stairs. Gabriel appeared, and gave vent to a cry of joy when he saw his master before him.

"How is my wife?" asked the Professor.

"Mrs. Werner is not at home," replied Gabriel, shyly. He beckoned his master into the room: there he gave him Ilse's letter. The Professor read the lines, and held them in his hands as if stunned. This also was a manuscript which he had found. It informed him that his wife had gone from him: every word went like a dagger to his heart. When he looked at Gabriel he perceived that he did not yet know all. The servant told him what had happened. The Scholar pushed the chair from him; his limbs trembled as in a fever.

"We will leave this house immediately," he said, faintly; "collect all the things."

Like a Romish priest who prays in secret devotion to his God, he had veiled his head from the sounds which sought to penetrate his soul from the

outward world. He had closed his ears and eyes to the figures that moved about him. Now fate had torn the veil from his head.

"Mr. Hummel would not depart before your arrival," continued Gabriel; "he is in great haste."

"I shall go to his inn; follow me," said the Professor; "but first mention at the castle that I have departed."

He turned away and left the house. As he passed by the castle, he cast a wild look on the windows of the room which the Sovereign inhabited. "He is not returned yet; patience," he murmured. He then went, as if in a state of stupor, to the inn. He ordered a room, and inquired after his landlord. Immediately afterwards Mr. Hummel entered.

"Good news," began the latter, in his softest tone; "a messenger from the Crown Inspector brings me the report that they have all made a safe journey. It must have been a matter of caution that there is no letter for you."

"It was indeed a matter of caution," repeated the Scholar, and his head sank heavily on his breast.

Mr. Hummel seated himself close to him, and whispered in his ear. At the last words the Professor sprang up in terror, and a groan sounded through the room.

"A man is not a screech owl," declared Mr. Hummel, pacifyingly; "and it would be unjust to expect of him that he should be able to distinguish in the darkness the head from the tail of a rat; but every householder knows that there are also worthless contrivances of architecture. These intimations I make to you only, to no one else. I sent my card a few days ago to your father-in-law. Little Fritz Hahn has, in your absence, become a Doctor Faustus, who will carry off my poor child under his fiend's cloak to Bielstein. May I announce your arrival there?"

"Say," replied the Scholar, gloomily, "that I will come as soon as I have settled matters here."

He held Mr. Hummel firmly by the hand, as if he did not like to part from the confidant of his wife, and led him down to the hall. New travelers had arrived there, and a little gentleman in a cloak and a beautiful silk traveling-cap, turned, without looking from under a large umbrella, to the Professor, and said:

"I should be much obliged if you would show me to a room, waiter. Am I in the right place here?"

He mentioned the name of the city; the Professor took the gentleman's traveling-bag from him, seized him by the arm without saying a word, and took him rapidly up the stairs.

"Very polite," exclaimed Raschke, "I thank you sincerely, but I am not at all tired; my only wish is to speak to Professor Werner. Can you arrange for an audience with him?"

Werner opened his room, took off his hat, and embraced him.

"My dear colleague," cried Raschke, "I am the most fortunate traveler in the world: usually a pilgrim on the highroad is contented if no misfortune happens to him, but I have met in the carriage with modest and thoughtful men. The conductor on changing carriages carried my cap after me, and some one kindly accompanied me to this house; and now when, for the first time, I stand on my own feet, I find myself in the arms of him whom I came to see. It is a pleasure to travel, colleague: at every mile-stone one observes how good and warm-hearted the people are among whom we live. We are fools that we do not deliver our lectures in carriages; the anxieties of our wives are unjustifiable; a man can manage by himself."

Thus did Raschke exult.

"Who lives in this room—I or you?"

"You may remain with me or have the adjacent room, as you please," replied Werner.

"Then with you; for I wish to be without you, my friend, as little as possible."

"You come to a man who is in need of consolation," said the Scholar. "My wife is with her father; I am alone," he added, with faltering voice.

"You look to me like a traveler who draws his cloak around him in bad weather," exclaimed Raschke; "therefore what I bring you will at any rate not disturb you in cheerful repose. My business as messenger is to lower a human soul in your eyes; that is hard for us both."

"I have to-day experienced what would shatter the foundations of the strongest structure. There can be but little that would shock me now: I am composed enough to listen."

Raschke seated himself by him and told his story. He fidgeted about on the sofa, slapped his friend on the knee, stroked his arm, and begged for composure.

Again was a veil drawn from the head of the seeker, who had believed himself to be speaking alone with his God. The Scholar was silent, and did not flinch.

"This is fearful, friend?" he said, at last.

With that he broke off, and the whole evening he did not say a word about the Magister.

The following morning the Professors sat together in Werner's room. Werner at last threw the two parchment sheets on the table.

"With these at least the Magister has had nothing to do. I myself fetched them out of the old rubbish: there lies the missal on the chest. It demands great self-control for me to look at that dearly-bought acquisition."

Raschke examined the parchment.

(To be continued.)

SELECTIONS FROM THE GERMAN.
TRANSLATED BY MARY MORGAN (GOWAN LEA).

VII.

"Dying! yet thou smilest ever;
Self-consuming—how canst sing?"

THE POET'S ANSWER.

O LOVE, you use me cruelly!
I sing, yet must I say
My heart is aching, sighing:
The tapers there decay,
Yet shed a light in dying.
Love-pain sought once a distant star
To dwell in some secluded spot;
It found me ere it wandered far,
And now, alas! it wanders not.

—Goethe.

VIII.
IN MY BARK.

SILVERY clear a gleam of beautiful light
Follows on my bark in this dark hour:
Such thy influence upon the night
Of my life—a heavenly soothing power.

Every glimmer on the billows there,
Vanishes with a succeeding tide;
But thy soul on mine shines ever fair,
And thy light forever doth abide.

—Meissner.

IX.
REST.

HOLY night! the systems of the worlds
Calmly move through the celestial sphere;
Light and peace—are they of heaven alone—
Known not unto mortal here.

Like to spectral forms that haunt and fade
Are—amid earth's turmoil and its woe—
Our most sacred and exalted moods—
Holist sentiments we know.

Wears the gallant victor dying wreaths?
Earns he but the laurels that decay?
Leaving them at last on earth's dull shore,
Does he sink and pass away?

Give me rest! O Peace, I crave but thee;
Thine the face I seek in yonder sky;
Darkness all around me, tired, astray,—
Peace! O let the pilgrim die.

—Tiedge.

NOTES.

It is with deep regret that we learn of the death of an honored contributor, Mr. Xenos Clark. Mr. Clark's contributions to THE OPEN COURT began with the first number.

An esteemed contributor, whom official position has brought into contact with the manifold forms of human degradation, with Pauperism, Lunacy and Crime, writes; "In such a position a man needs a theory of the universe which affords room for hope, here as well as hereafter, to enable him to perform his daily round of duty, without such a depression of spirits as would be crushing. A religion of progress, and an ethics based upon that, gives one inspiration and strength, and makes the part that one has been chosen for, such of the kind given me to do, a source of profound gratitude. I write thus because I feel it due to you, and the promoters of your journal, to tell you how I am helped by it."

The Vermont Microscopical Association announces the offer of a prize of two hundred and fifty dollars for each discovery of a new disease germ. Microscopists, and all interested, are referred for further information to C. Smith Boynton, Secretary of the Association, Burlington Vt.

Mr. George J. Romanes, the English scientist, will contribute to THE OPEN COURT of July 11th, an article entitled "The Psychic Life of Micro-Organisms." Mr. Romanes writes in reply to the criticisms of M. Alfred Binet. In the preface to a work by the latter author, "The Psychic Life of Micro-Organisms," recently published by THE OPEN COURT PUBLISHING COMPANY, M. Binet took issue with Mr. Romanes as to the stage of animal development at which psychological powers first appear. The two standpoints, apparently, were radically different. M. Binet's conclusions were based upon accurate investigations into the life of microscopic organisms; he asserted that "psychological phenomena" are found in unicellular organisms, in lower-class beings, and are not superadded at higher stages in the course of zoological development. The studies of Mr. Romanes had led to the contrary conclusion, and, from this arose the occasion of M. Binet's critical remarks.

"Light on the Path" is the title of a little pamphlet of sixty-eight pages which the Theosophical Book Company of Boston have recently issued. It is termed a "treatise for the personal use of those who are ignorant of the Eastern wisdom and who desire to enter its influence." The title-page is stamped with an equilateral triangle. The equilateral triangle, in fact, seems to be an important factor in the initiation of neophytes into the wisdom of the East. It symbolizes the rigidity, necessity, universality, etc., of theosophical doctrines—their equality of relation. Instance the following logical specimens: rule 9) Desire only that which is within you; rule 10) Desire only that which is beyond you; rule 11) Desire only that which is unattainable. After the infliction of twenty-one canons similar to the above-quoted, the author concludes: "they are the first of the rules which are written on the walls of the Hall of Learning: Those that ask shall have. Those that desire to read shall read. Those who desire to learn shall learn [*sic!*];" and in substantiation of this, the equilateral triangle is again mysteriously appended. We have been unable to master the occult philosophy of "Light on the Path."

The disclaimer of Dr. R. B. Westbrook, which appears in the columns of the present issue as a reprint from the July *Freethinker's* magazine, was prompted by the utterance of various liberal papers that "the President of the American Secular Union was not orthodox in his infidelity." Dr. Westbrook objects, with force and propriety, to the unwarranted intrusion upon honest and fearless men of an opprobrious epithet. But a word should be said in defence of that good and faithful servant, the lexicographer, whom Dr. Westbrook so harshly arraigns. The perversion of language which led to the present use of the word "infidel," cannot be attributed to the lexicographer. The lexicographer has not "added to the primitive and philological meaning of the word an arbitrary definition of his own; he never had that power; he records simply what the creative genius of a language gives forth. But unfortunately for many English words that creative genius was puritanical. A similar, though inverse, process is discoverable in 'miscreant.' 'Miscreant' originally denoted a wrong-believer. But rascality and unbelief became in some way identified in the Christian mind, and now the bona fide miscreant, as a supplement to his knavery, must bear the additional philological stigma of heathenish unbelief. The process, whether it has beautified or perverted a word, is a natural and constant one.

THE TEACHER'S OUTLOOK.

Published by The Teacher's Publishing Company, Des Moines, Iowa. A monthly magazine devoted to the interests of teachers and advanced pupils and intended to supplement the good work done by other school journals rather than to occupy the same field. Instead of filling its columns with school methods, school aids, and the details of school work, it will aim to interest the teachers in matters outside of the atmosphere of the school room, and its columns will furnish an Outlook upon affairs of life, facts in science and nature which illustrate and test the theories of the schools. In this work it will hope to furnish the teacher with a natural source of inspiration and mental energy, quicken thought and make the school room a place joyous with buoyant spirits that offer a responsive greeting to the inquiring minds of youth, rather than heavy with that gloom and dullness which often surrounds the daily toil.

A leading feature of the magazine will be a monthly review of current events, civil and industrial problems, scientific inventions, discoveries, etc.

Another feature will be a very complete Review of current Literature, especially of all books and magazines coming within the sphere of its labor. We have entered into arrangements with all the leading publishers to keep us informed of all their new and prospective publications, and the Reviews will be made by competent critics.

Still another feature, and a very important one as giving a practical value to the Outlook offered, will be the formation of a circle of writers out of its subscribers, from which it hopes to draw its corps of contributors. This plan is original as applied to a magazine, and is based upon the idea of co-operation, or mutual helpfulness. If met with that appreciation necessary to its full execution it will be the means of introducing many new writers to the public, and of aiding many who now lack the training in the expression of thought necessary the field of literature into which their tastes would lead them. \$1.50 per year. Sample copies 20 cts. Good pay to agents. 112

TWENTIETH CENTURY

HUGH O. PENTECOST, Editor.

The only so-called "liberal" paper that is in favor of radical social regeneration.

Among its contributors are leading single taxers, socialists, anarchists, protectionists, free-traders, agnostics, Christians, Ethicists, spiritualists and materialists. Some of them are:

Edward Bellamy, Clinton Farbish,
Rev. John Chadwick, Dyer D. Lund,
Rev. W. S. Crowe, T. L. McCready,
Rev. Henry Ford, W. A. Macquarrie,
Rabbi G. Gottlieb, W. L. Sheldon,
Rev. F. C. Kimball, A. Van Deusen,
Sam'l J. McDonald, Rev. J. C. F. Greenbush,
Rev. K. Hober Newton, Rev. John Hall, D. D.,
Wm. M. Salter, L. D.,
Ella Stevens, Rev. James M. Whitton,
Wm. T. Crossdale, Ph. D.,
Dan'l DeLeon, Ph. D.,

Elegantly printed on fine white paper. Issued weekly. One dollar a year.

Each new subscriber will receive a copy of Mr. Pentecost's book, "What I believe." Sample copies free.

Twentieth Century Publishing Company,
No. 4 Warren st., NEW YORK CITY.

"FAIR PLAY,"

in its issues of May 11th and May 18th, exposes the unfounded nature of the claim made by Christian prohibitionists that the Bible is favorable both to abstinence and prohibition. It is demonstrated that it is neither, hundreds of texts being cited by the compiler of

"BIBLE TEMPERANCE."

Labor, governmental, and financial questions discussed by able writers.

During the Summer a complete history will be given of the Walker and Harman "Autonomous Marriage," together with a concise statement of the principals' present views upon the subject. Those who sincerely now will therefore receive the "official report" of this famous cause.

MAKING BREAD DEAR.

A CONTROVERSY BETWEEN

WHEELBARROW and SYMPATHIZER

UPON

Corn and The Board of Trade

WITH REFERENCE TO

THE LABOR QUESTION.

PRICE, 10 CENTS.

This little pamphlet is a reprint from the columns of *THE OPEN COURT* of an able and spirited controversy between Wheelbarrow and a prominent Chicago financier. The title indicates the subject. Wheelbarrow attacks the combinations of trade that "make bread dear and laborers cheap." Sympathizer declares Wheelbarrow's article a misrepresentation of facts, and characterizes it as misleading and obscure. Wheelbarrow replies, explains more fully his position, and contends that the arguments of Sympathizer have only strengthened the stand he has taken. The discussion is by practical men, and forms an interesting chapter in economic.

THE Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY
 BY ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects:

1. *The Psychology of the Cell—Introductory.*
2. *The Structural and Physiological Character of Proto-Organisms: the History and Sensory Organs.*
3. *The Psychology of Nutrition: Holozytic, Saprophytic, and Animal Nutrition; Predatory Habits of Certain Animalcula.*
4. *Colonies of Unicellular Organisms.*
5. *Reproduction of Proto-Organisms.*
6. *Reproduction of Higher Animals and Plants.*
7. *The Physiological Function of the Nucleus.*
8. *Correspondence between Alfred Binet and Ch. Richet (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.*

PRESS NOTICES.

*** "The little book will be no less than fascinating to all who are interested in the subject of comparative psychology." * * * *Boston Beacon*.
 * * * "Intensely interesting." * * * *Pharmaceutical Era*.
 * * * "We recommend the book to all earnest students of the great problems of evolution, as being unexcelled in the representation of modern biological investigations." * * * *Reformed Quarterly Review*.
 * * * "The book will repay perusal." * * * *N. Y. Medical Abstract*.
 * * * "This monograph is an original work and will add a new light to the vision of the scientist and general reader." * * * *Tribune Blade*.
 * * * "A very remarkable book." * * * *Health and Home*.

Three Introductory Lectures

—on—

The Science of Thought.

(First published in THE OPEN COURT of June, July, and August, 1887.)

BY F. MAX MÜLLER.

1. The Simplicity of Language;
2. The Identity of Language and Thought; and
3. The Simplicity of Thought.

With an Appendix which contains a Correspondence on "Thought without Words," between F. Max Müller and Francis Galton, the Duke of Argyll, George J. Romanes and Others.

Neatly Bound in Cloth. Price, 75 Cts.

The Idea of God.

By Dr. PAUL CARUS.

PRICE 15 CENTS.

Being a disquisition upon the development of the idea of God in human thought and history; discussing.

1. The Nature of Ideas;
2. The Etymology of the Word God;
3. God as Abstract Idea;
4. The Conceptions of God (Polytheism, Monotheism, Pantheism, Theism, and Atheism);
5. Definition of the Idea of God;
6. Entheism, the Monistic Conception of God.

DEFINITIONS EXPLANATORY OF THE POSITION OF "THE OPEN COURT."

THE DATA of experience are perceptions.

REALITY is the sum total of all that is.

TRUTH is the conformity of cognition to reality.

[Truth being a relation between subject and object appears to be relative in its nature. Absolute truth is a self-contradiction; it would imply cognition without a cognizing subject.]

At the same time it is obvious that absolute existence (in fact everything absolute) is impossible. Reality is properly called *Wirklichkeit* in German, derived from *wirken*, to take effect. Reality is not immovable and unchangeable absoluteness, but the effectiveness of things in their relations. Reality therefore implies not only existence, but the manifestation of existence also. Existence and its manifestation are not two different things; both are one.

The idea of something absolutely Unknowable is therefore also untenable; it would imply the existence of an object whose existence is not manifested *i. e.*, existence without reality; *Sein ohne Wirklichkeit*—which is a contradiction, an impossibility.]

SCIENCE is the search for truth.

The nature of science is the economy of thought. (*Mach.*)

Economy of thought is possible through application of the laws of form to thought.

KNOWLEDGE is the possession of certain truths.

[Knowledge is, so to say, the present stock or capital with which Science works. Science cannot exist without knowledge. The object of Science is not only to increase and enlarge knowledge but also to purify the present stock of knowledge from vagueness, errors, and misconceptions.]

The purpose of knowledge is that of increasing our power over nature.]

MONISM is that philosophy which recognizes the oneness of All-existence, and the Religion of Monism teaches that the individual, as a part of the whole, has to conform to the cosmical laws of the All.

RELIGION is man's aspiration to be in harmony with the All.

[Religion has been defined differently in the columns of THE OPEN COURT, but all definitions that have been presented are in strict agreement. Mr. Hegeler in No. 25, defines Religion as "man's union with the All" (taking the definition from the Lutheran Catechism "Religion ist der Bund des Menschen mit Gott durch Gott," and replacing the Word God by the more comprehensive word THE ALL). The editor has defined Religion as "man's consciousness of his relation to the All" (No. 24); as "Das Allgefühl im Einzelnen," the All-feeling in the individual (see

foot-note page 965); as "man's conception of the world that serves him as a guiding-star through life" (page 1180).]

MORALS are man's conduct in so far as it is in unison with the All.

[The basis of morality is religion. A moral educator or preacher may justly be asked, "On what authority dost thou justify thy precepts?" And he will tell us that his authority is not personal; he speaks in the name of universal order. Accordingly his authority is that of religion. If it were not so, all his good precepts would have no foundation; they would hover in the air like beautiful dreams that have no reality.]

ETHICS is the Science of Morals; it teaches man why he must, and how he can, regulate his conduct so as to be in unison with the All.

Natural history and the history of mankind prove that here on earth a constant progress takes place developing ever higher forms of existence.

Morally good are those acts which are in harmony with the All, *i. e.*, those which enhance progress, and *morally bad* are those which are not in harmony with the All, *i. e.*, those which retard or prevent progress.

[Religion (man's aspiration to be in unison with the All) has naturally produced many superstitious notions in the world, of its origin, and of its purpose. Similarly, science (man's search for truth) has produced many errors or false notions of reality. But all the superstitions of religion do not prove that religion as such is an illusion, and all the errors of science are no evidence that science as such is a sham.]

It is obvious that religion and science, as here defined, are not contradictory to, but complementary of, each other. If religion and science do not agree, it is a certain sign that our conception of either the one or the other is wrong. The history of the human mind has been one of constant conflict and reconciliation between religion and science. Their relation has repeatedly been disturbed and re-adjusted.

The unitary conception of the world affords the only basis for the union of Religion and Science, and opens a new vista of progress for both.]

RECENT CONTENTS OF "THE OPEN COURT."

THE RISE OF THE PEOPLE OF ISRAEL.

[A masterly sketch of the history of Israel's people in the epoch of national organization; marked by critical acumen and a love of truth. The author, PROF. CARL HEINRICH CORNILL, is an orthodox theologian, of Königsberg, Germany. (Nos. 90, 91, 92.)]

THE SITAHARANAM; OR, THE RAPE OF SITA.

[A charming tale of ancient Hindu life; a typical selection from Sanskrit literature. Translated from the original text by PROF. ALBERT H. GUNLOGSEN. (Nos. 90, et seqq.)]

THE TRANSIENT AND THE PERMANENT IN THEODORE PARKER.

[A discourse held at the dissolution of Parker's society, by MONTEGUE D. COWLEY. Interesting personal reminiscences, historical, literary, educational. (Nos. 91, 93, 94.)]

THE PHYSICAL BASES OF PERSONALITY.

[The second of a series of essays by the eminent French psychologist, TH. RIBOT. Translated with his consent from the "Diseases of Personality. An important contribution to modern psychology. (No. 93.)]

THE WORKINGMAN'S DOLLAR.

[By WHEELBARROW. A sound discussion of an economical question now engaging the attention of all. (No. 93.)]

THE ELECTRICAL EXPERIMENTS OF PROF. HERTZ.

[The electrical researches of Prof. Hertz, of Karlsruhe, form one of the most important contributions to modern science. They show that electricity acts in the same way and according to the same laws as light and radiant heat. (Nos. 95 and 97.)]

THE PSYCHIC LIFE OF MICRO-ORGANISMS.*

BY GEORGE JOHN ROMANES.

UNDER the above title M. Binet has just published an English translation of some interesting articles which within the last year or two he has supplied to the *Revue Philosophique*. Moreover, in a preface which he has written expressly for this "American Edition," he devotes more than half his pages to a criticism of my psychological work in its relation to micro-organisms. For this reason, and also because the subject is one of much interest *per se*, I should like to reply in an American periodical to the criticisms which M. Binet has addressed to an American public.

It is needless to say that M. Binet is a *savant* of high standing, who has done, and is doing, admirable work in psychology. Therefore I should be sorry if it were to turn out that there is any serious discrepancy in our views touching the psychological questions that are involved by a study of life in its lowest forms. But, as I hope now to show, it appears to me that M. Binet has greatly exaggerated the amount of difference that obtains between us.

According to M. Binet, the unicellular organisms display "most of the psychological properties which Mr. Romanes reserves for this or that higher-class animal": indeed, he goes so far as to say, "we could, if it were necessary, take every single one of the psychical faculties which Mr. Romanes reserves for animals more or less advanced in the zoölogical scale, and show that the *greater part* of these faculties belong equally to micro-organisms." This statement of his case, however, I can only regard as in an extraordinary measure hyperbolic. For, without going beyond the diagram in my works to which he here especially refers, if this statement of his case were to be taken literally, we should have to suppose that M. Binet is prepared to prove that the *majority* of the following emotional and intellectual faculties occur in micro-organisms, namely: 1) pleasure and pains; 2) memory; 3) surprise, fear, primary instincts; 4) sexual emotion, association by contiguity; 5) parental affection, social feelings, sexual selection, pugnacity, industry, curiosity, recognition of offspring, secondary

instincts; 6) jealousy, anger, play, association by similarity; 7) affection, reason; 8) recognition of persons; 9) sympathy, communication of ideas; 10) emulation, pride, resentment, æsthetic love of ornament, terror, recognition of persons, understanding of words, dreaming; 11) grief, hate, cruelty, benevolence, understanding of mechanisms; 12) revenge, rage, use of tools; 13) shame, remorse, deceitfulness, ludicrous, incipient morality.

Now I should scarcely have deemed it worth while to have enumerated these things, if M. Binet had not repeatedly stated—and this with all the emphasis of italics—that, taking the above list of psychological faculties as named by me in what I suppose to be the order of their appearance throughout the animal kingdom, he can prove that the "*greater part*" of them belong to micro-organisms. Of course the statement is on the face of it too absurd for comment. As a matter of fact, and according to his own subsequent showing, the only question that can possibly arise in this connection has reference to the first three or four of the above thirteen levels of psychological growth—or, which is the same thing, to the first six or seven among the forty-five psychological characteristics which I have named, and to which he alludes. Obviously, therefore, M. Binet cannot mean what he says. But as he no less certainly does mean that in his opinion I have not allowed enough to the unicellular organisms in respect of "psychic life," it seems desirable that I should take up the challenge which he has thrown down.

The psychological faculties with which M. Binet *expressly* credits these unicellular organisms are fear, surprise, memory, and consciously selective discrimination within certain very moderate limits of mental capacity. With regard to surprise and fear he says: "We may reply upon this point, that there is not a single infusory that cannot be frightened, and that does not manifest its fear by a rapid flight through the liquid of the preparation. If a drop of acetic acid be introduced beneath the glass-slide, in a preparation containing quantities of Infusoria, the latter will at once be seen to flee in all directions like a flock of frightened sheep."

In proof of memory he says: "Every time an animal repeats the same action under influence of the

* A Reply to the Criticisms of M. Alfred Binet advanced in his recent work, "The Psychic Life of Micro-Organisms" (OPEN COURT PUBL. CO., CHICAGO, 1889).

same excitations, that fact proves that the animal is possessed of memory."

Lastly, in proof of consciously selective discrimination, amounting to the psychological level of "instinct," he quotes against me an observation on *Diffugia urceolata*, by Prof. Verworn. From this observation it seems that "the *Diffugia urceolata*, which inhabits a shell formed by particles of sand, emits long pseudopodia which search at the bottom of the water for the materials necessary to construct a new case for the filial organism to which it gives birth by division. Two facts are to be remarked in this observation: first, the act whereby *Diffugia* collects the materials for providing the young individual with a case, is an act of preadaptation to an end not present, but remote; this act, therefore, has all the marks of an instinct. Further, the instinct exhibits great precision; for the *Diffugia* not only knows how to distinguish, at the bottom of the water, the materials available for its purpose, but it takes only the quantity of material necessary to enable the young individual to acquire a well built case."

Now, even if these facts were adequate to sustain the interpretation here placed upon them, they would still not have been available for the purpose of criticizing my book. For, on the one hand, they were not observed until after the publication of that book, and, on the other hand, I expressly state in the book itself that the psychological classification there given was given in accordance with the evidence which up to that time had been forthcoming. But, disregarding this point, I maintain that the facts are very far indeed from being capable of sustaining M. Binet's interpretations. In the first place, they obviously do not present "all the marks of an instinct." In point of fact, they only present one of the marks of an instinct—*i. e.*, that of "preadaptation to an end not present, but remote." M. Binet, indeed, appears to suppose that every such "act of preadaptation" must be regarded as *ipso facto* evidence of adaptation due to instinct—or, in other words, that preadaptation and instinctive adaptation are synonymous terms. But a very little thought would have dispelled this idea. The distinguishing "mark" of an instinct is, not that the action which it prompts should be preadaptive only, but further that it should be due to consciousness: not only must it be adjustive; it must also be mental. And the fact of its being adjustive does not in itself furnish any evidence that it is also mental. Each diastole of the heart is "an act of preadaptation" with regard to the next systole; but this fact does not in itself give us any reason to conclude that the action of the heart is instinctive. And, of course, hundreds of other vital activities might be quoted (especially during embryonic life) which are all preadaptive in this

sense, without furnishing any evidence at all of being therefore instinctive. In short, the evidence of any action being instinctive must consist in evidence of its being due to an element of mind; and this is just the evidence which is wholly lacking in the case of *Diffugia*. The bare fact that it performs this act of preadaptation furnishes no justification of the statement that *Diffugia* "knows" what it is about while performing such an act—or, indeed, that it presents so much as the condition to knowledge of any kind (*i. e.*, consciousness).

So much, then, for M. Binet's claims on the score of "instinct." Next, as regards his claims for "memory," I have merely to ask whether any man of common sense will agree with his criterion of memory—namely, "that every time an animal repeats the same action under influence of the same excitations, that fact proves that the animal is possessed of memory." The absurdity of this statement may be shown even upon "the paragon of animals," man himself. For, let a man have all his mental faculties suspended (*e. g.*, by a heavy dose of chloroform), and all the lower reflex mechanisms will continue to respond to their several "excitations." Breathing, for instance, will continue as regularly as ever—each breath being due to the "excitation" supplied by an accumulation of carbonic acid in the blood: will M. Binet therefore contend that each inspiration is due to the memory which a man retains of his previous inspirations even when memory of all else has been obliterated? Or will he affirm that, when in full possession of all his faculties, and against the utmost force of his own volition, his pendent leg will give a jerk every time I strike his knee-cap, therefore the "action" of his leg is due to his "memory" of the previous "excitations"? Now, if the absurdity of his criterion of memory admits of being thus rendered apparent even in the case of the highest and most intellectual of animals, *a fortiori* this absurdity becomes more and more apparent the further we descend through the animal series, until, by the time we arrive at the Protozoa, it reaches what I can only designate as the acme of nonsense. Furthermore, in the very book which he is criticizing I am careful to state, "that the earliest *analogy* we can find to memory is to be sought in living tissues other than nervous, and that it occurs in protoplasm." The following are some of the examples given, and they are much better (because less equivocal) than any of the instances referred to by M. Binet. "When a constant current is allowed to pass for a short time through a bundle of muscular fibres, in the direction of their length, and is then opened, a change is found to have been produced in the excitability of the fibres, such that they are less excitable than before to a stimulus supplied by again passing the current in the same direction,

and more excitable to the stimulus supplied by passing the current in the opposite direction. This memory of a muscle touching the direction in which a galvanic stimulus has passed endures for a minute or two after the current has ceased to pass (Frog). I have found this curious fact to hold in the case of muscular tissues of various animals, from the Medusæ upwards. Another equally good instance of what may be termed protoplasmic memory is to be found in the facts of the so-called 'summation of stimuli,' which occur more or less in all excitable tissues, *i. e.*, wherever living protoplasm is concerned. These facts are that if a succession of stimuli are applied to the excitable tissue, the latter becomes progressively more and more quick, as well as more and more energetic, in its response; each stimulus leaves behind it an organic memory of its occurrence."*

Lastly, substantially the same remarks have to be made touching my critic's views upon "surprise" and "fear." Merely on the ground that certain unicellular organisms will display increased activity under stimulations supplied by concession, "acetic acid," etc., he immediately concludes that these animalcula are "frightened like a flock of sheep." Here, as elsewhere, I can only wonder that a psychologist of M. Binet's attainments can have written with thoughtlessness so inexcusable.

The truth of the matter appears to be that M. Binet has never put to himself the simple question: What, in our study of comparative psychology, are we to take as our criterion of mind? Yet this is clearly the most elementary of all questions lying at the base of such study—in fact, it is the question which must be answered before we can be in a position so much as to begin that study. In my own works I have considered it more fully than anybody else; yet my critic nowhere alludes to the criterion which I have there laid down, and in virtue of which I have abstained from expressly accrediting the unicellular organisms with any such degree of psychic life as he claims for them. For this reason—as well as for others which will be stated further on—I can only conclude that M. Binet has either never read my books at all, or else that he has so far forgotten them as to rely for his criticisms only on the diagram of psychological faculties which occupies the first page of the one to which he alludes. The criterion of mind in question is as follows:

"Does the organism learn to make new adjustments, or to modify old ones, in accordance with the results of its own individual experience? If it does so, the fact cannot be due to merely reflex action, for it is impossible that heredity can have provided in advance

for innovations upon, or alterations of, its machinery during the lifetime of a particular individual."

Possibly enough, this criterion may not meet with M. Binet's approval; but, if so, he ought to have criticized the criterion itself, and not the practical results to which its application logically leads. Moreover,—and this constitutes my principal reason for inferring that he has not read my works at all,—he appears to be unaware that its practical application does result in conceding to the unicellular organisms an apparent measure of "psychic life" as high as any for which he contends on the basis of his own examples. In other words, I have myself quoted observations on the psychic life of these organisms which are even more indicative of such life on their part than are any of the facts mentioned by M. Binet. For example, after giving some observations of my own, a chapter in "Protozoa" proceeds as follows:

"But, without denying that conscious determination may here be present, or involving ourselves in the impossible task of proving such a negative, we may properly affirm that until an animalcule shows itself to be teachable by individual experience, we have no sufficient evidence, derived or derivable from any number of such apparently intelligent movements, that conscious determination is present. Therefore, I need not wait to quote the observations of the sundry microscopists who detail facts more or less similar to the above, with expressions of their belief that microscopical organisms display a certain degree of instinct or intelligence as distinguished from mechanical, or wholly non-mental adjustment. But there are some observations relating to the lowest of all animals, and made by a competent person, which are so remarkable that I shall have to quote them in full. These observations are recorded by Mr. H. J. Carter, F. R. S., in the 'Annals of Natural History,' and in his opinion prove that the beginnings of instinct are to be found so low down in the scale as the Rhizopoda. He says: 'Even *Æthalium* will confine itself to the water of the watch-glass in which it may be placed when away from sawdust and chips of wood among which it has been living; but if the watch-glass be placed upon the sawdust, it will very soon make its way over the side of the watch-glass and get to it. This is certainly a remarkable observation; for it seems to show that the Rhizopod distinguishes the presence of the sawdust outside the watch-glass, and crawls over the brim of the latter in order to get into more congenial quarters, while it is contented with the water in the watch-glass so long as there is no sawdust outside.'"*

The chapter goes on to quote certain observations even more suggestive of mental action than the above; but enough has now been said to show that M. Binet

* Mental Evolution in Animals, pp. 112-113.

* Animal Intelligence, p. 19.

is not entitled to represent my works as having ignored the class of facts with which his own are concerned. On the contrary, the only difference between us has reference to the degree of certainty with which we severally conclude, on the basis of such facts, in favor of conscious intelligence on the part of these lowly organisms. In M. Binet's opinion it is enough to state such facts, and directly to conclude from them in favor of such intelligence. In my opinion, on the other hand, we are not entitled to arrive at this conclusion in so unreserved a manner; and, therefore, in drawing up the psychological diagram to which M. Binet refers, and which everywhere assigns mental faculties to the class of animals where there is first any *unequivocal* proof of their occurrence, I have merely left the question open as to whether, or how far, we are entitled to accredit the micro-organisms with psychic life. And this for the following reasons, which I quote from the book that forms the subject of M. Binet's criticism.

"It is clear that long before Mind has advanced sufficiently far in the scale of organization to become amenable to the test in question, (*i. e.*, the Criterion of Mind above mentioned,) it has probably begun to dawn as nascent subjectivity. In other words, because a lowly organized animal does not learn by its own individual experience, we may not therefore conclude that in performing its natural or ancestral adaptations to appropriate stimuli, consciousness, or the mind-element, is wholly absent; we can only say that this element, if present, reveals no evidence of the fact. But, on the other hand, if a lowly organized animal does learn by its own individual experience, we are in possession of the best available evidence of conscious memory leading to intentional adaptation. Therefore, our criterion of mind applies to the upper limit of non-mental action, not to the lower limit of mental."*

Or, as the passage goes on to state, if our evidence of mind in the lower animals must always depend on inferences drawn from actions, the cogency of such evidence must necessarily diminish as we recede from minds inferred to be like our own, towards minds inferred to be less like our own. Therefore, when we come to the case of very low organisms, such as those which we are now considering, we ought to remember that we are in a region where analogy has reached a vanishing-point: we ought to feel the highest degree of uncertainty in attributing merely adaptive action to any such process of intelligent volition as, *mutatis mutandis*, it might have betokened if performed by ourselves. Unless it can be shown that the action is not merely adaptive, (*i. e.*, not merely the possible result

of natural selection having operated for countless time on non-intelligent material,) but also capable of being varied in accordance with the results of individual experience; we have no right to conclude that it presents any subjective counterpart.

The importance of bearing these considerations in mind is sufficiently exemplified by M. Binet's own treatment of "The Psychic Life of Micro-Organisms." Thus, to take only one example, in his opinion the best evidence he has to give of the occurrence of such life in these organisms is furnished by spermatozoa and spermatozooids in their behavior towards ova and ovules. In particular, he regards the selective persistency with which these mobile cells seek out their physiological partners for the purposes of fertilization, as furnishing the most cogent proof he has to present of purposive determination on the part of unicellular organisms. Now, it is of course unquestionable that all the activities in question are highly suggestive of intelligence; but, to say the least, it is equally possible to suppose that all these activities may be due to special endowments which have been gradually conferred by natural selection on highly specialized, though wholly unintelligent, cells, for the purpose of more and more efficiently discharging their special functions. And this view of the case is strongly supported by some recent highly interesting researches, which M. Binet quotes without appearing to perceive that such is their obvious implication.

The researches in question may be briefly described as follows.

Going upon the supposition that the spermatozooids of cryptogamic plants must be attracted to the female cells by means of some emanations from the latter acting as appropriate stimuli to the former, Prof. Pfeffer of Tübingen tried at random a large number of chemical solutions, in order to find if any of them would succeed in attracting the spermatozooids. Eventually he found that spermatozooids of certain ferns are infallibly attracted by a solution of malic acid, so that if a pipette be filled with this solution and dipped into a watch-glass of fluid containing the spermatozooids, the latter will crowd from all parts of the fluid into the pipette. Now, as malic acid occurs in the ferns, it is easy to see how natural selection may have utilized this substance for the purpose of guiding spermatozooids to female cells: survival of the fittest can very well have acted on the spermatozooids through countless generations—always favoring those to which malic acid acted in any degree as a stimulus, until malic acid now constitutes an unfailing attraction. Yet, if so, there need never have been any "psychic life" in the matter: the spermatozooids are attracted to their physiological correlatives in a manner as purely "mechanical" as particles of water are

* Mental Evolution in Animals, pp. 21-22.

attracted to sulphuric acid by their chemical affinity for that substance.

Upon the whole, then, I cannot feel that M. Binet's criticism is in any way successful. In so far as he really differs from me—and this is certainly less than he supposes—his objections appear to arise from his having neglected to read my works.

CARLYLE'S RELIGION.

WITH REMINISCENCES OF HIS TALK THEREON.

BY MONCURE D. CONWAY.

CARLYLE was the most remarkable religious phenomenon I have ever encountered. I have preserved some reminiscences of him in that aspect which I have never published, wishing to study them more carefully, and in the light of the facts which his biography promised.

Mr. Froude's romance which passes for the biography of Carlyle,—but which is not even realistic romance to others who knew its subject personally,—has by no means recognized the strange combination of hereditary and original elements in his spiritual being. Nor can it be clearly discovered from Carlyle's writings. The sweeping, sometimes biting, skepticism of his conversation did not get into his books. Only those who knew him personally could detect it in his *Life of Stirling*. To the average reader the diatribes of that volume appeared directed mainly against religious insincerities in general. Professor Francis William Newman told me that when the book appeared Carlyle's friends congratulated each other that he had at last spoken out boldly. But it is difficult to find in the charming biography a distinct negation or affirmation of any theological doctrine.

It was still possible, when a passage appeared in his *Life of Frederick*, affirming his (Carlyle's) faith in Calvin's fatalism, for the Presbyterians to claim that the great author was on their side. It must be admitted, however it may be explained, that this famous apostle of self-truthfulness never extended his principle to open testimony against discredited dogmas. Speaking once of my predecessor in the South Place pulpit, William Johnston Fox, M. P., he said: "I once went to hear him; he was a polished and powerful orator; but he was appealing to a crowd of people on matters of which they were no judges at all." In his distrust of the populace I suspect he shared the notion of many Europeans, that superstition makes men more governable.

One evening we were talking of Strauss, whom I had recently visited. "His *Leben Jesu*," said Carlyle, made a strong and wide impression, but its views were not unfamiliar to me. Various persons had reached similar conclusions, but would never have dreamed of

proclaiming them to the world. He married an actress who made him miserable, and he had to separate from her; a good many people thought it a proper punishment of his heresy." The latter remark was made with a smile. Speaking of the Unitarian leader, Rev. James Martineau, he said, "Yes, I have met him several times. Once in a small company where a discussion about Christianity became warm, Martineau sat at an end of the room with his eyes closed, as if asleep; but I could see that he knew everything that was going on. I never cared much for Unitarianism. The best men I have known go that far must needs go much farther."

But Carlyle drew the line of compromise at reticence. When he was at Edinburgh, on the occasion of his installation as Lord Rector of the University, I was with him a good deal, and remarked his restlessness under the incidental religious ceremonies. I can readily believe the following story of whose truth I was assured by a Scotch gentleman. Carlyle was invited to pass some days in a country-town, in Scotland, with an old college-mate. They had been fellow-skeptics, and many a time had between them disposed of Christianity. But his old friend had become rich, the leading man in town, and naturally a zealous supporter of the kirk. He invited the parsons and deacons to meet Carlyle at dinner. According to usage the host said grace himself; it was a grace so long, unctuous, canting, that Carlyle could not stand it, but broke in with—"Oh, F——, this is damnable!"

Carlyle was a Calvinist who had lost his creed. To others such loss has been the dropping of a fetter; to Carlyle it was a breaking of the link that connected him with all he really loved. The real feeling is told in his pathetic poem "The Night Moth." He bowed to Goethe as a master, but could never quite forgive him for shattering his little shrine in the cottage at Ecclefechan. Goethe could easily become the happy man of the world, dress in velvet, and amuse himself with lords and ladies, and the Weimar theatre; but when Carlyle's supernatural visions faded they left him a peasant, surrounded by poor and ignorant people, and without either capacity or taste for the career of a man of the world. His youth had been devoted to preparation for a profession,—that of the Pulpit,—from which he had to turn at the moment when family and friends were ready to usher him with plaudits on a career whose splendor was prophesied by his genius. He had made desperate efforts to find some way of honestly remaining in the old homestead of faith; but all had been in vain; and it was no doubt this experience which broke out in rebuke of his college comrade in skepticism, who had sold his soul to the village parsons and deacons for the fine mansion to which he had visited his friend.

Scotch skepticism is generally more keen and incisive than that which one meets in England. In conversation Carlyle was sometimes so bitter against Christianity that it appeared as if he felt a sense of personal wrong. One evening, talking of William Maccall, with whom John Stirling had a notable correspondence, Carlyle said: "I remember Maccall; I have lost sight of him, but remember a vigorous way of expressing himself. I recall his breaking out in conversation about elevating the people: 'What can you do for a people whose God is a dead Jew!' A fair enough question. If I had my way the world would hear a pretty stern command—Exit Christ!"

One Christmas evening he said: "I observed some folk at the corner a little drunker than usual this morning. Then I remembered it was the birthday of their Redeemer."

I was present one evening when some one asked: "Mr. Carlyle, can you believe that all these ignorant and brutal millions of people are destined to live forever?" "Let us hope *not*," was the emphatic reply.

He had never been in a church of any kind since the visit to South Place already alluded to, when one day in the country, he was persuaded by some ladies to go and hear a famous Methodist. He returned furious about the prayer, which he summed up in these words: "O Lord, Thou hast plenty of treacle,—send us down a flood of it!"

And all the while there was a strong survival of Calvinism in Carlyle, which led him to divide the world into saints and sinners, sheep and goats,—to worship those, and doom these to unquenchable burnings—of course of the purely metaphorical kind represented in his own frequent "damns."

It was pathetic, too, to note the tenderness with which he clung to every shred of scripture which his intellect could honestly admire. This was shown in his enthusiasm for the book of Job,—which, however, once led him into a droll predicament. During one of his latest visits to Scotland he passed a night in the mansion of an old gentleman whom he had reason to esteem. In the evening this gentleman said: "Mr. Carlyle, it is my custom to read the scriptures to my family and servants before retiring; but your room is ready, and you need not remain if you do not wish it." "Wish it!" exclaimed Carlyle, impulsively,— "Why, I'll conduct the reading myself." The delighted host summoned children and servants, and placed the large Bible before Carlyle, who straightway turned to his favorite (though not much studied) book of Job. Unfortunately he hit on the chapter of Job's cursings: "Let the day perish wherein I was born"—and so on. Carlyle proceeded with faltering tones,—increasing nervousness,—a growing perception that the pessimist invectives were not suited to the children and servants;

but when he had got out "Why died I not from the womb"—he groaned, closed the book with a slam, and stalked out of the room.

As life was closing—so that it was an effort to hear what the old man said—his mind wandered back to the old hearthstone, to his parents, and he sometimes seemed striving to realize their views. One afternoon he said feebly to Mr. Justice Stephen who had called, "That fire is rather hot. It seems a curious thing that people should have believed that they were to be punished by fire." "The belief," said Sir James, "came from a time of cruel and savage punishments." "It would be very uncomfortable to continue in that grate through eternity; and yet my father, one of the ablest men I ever knew, believed that such would be the fate of most people,—he believed it as much as his own existence."

Carlyle's ideas of deity were vague, but in his last years sometimes spoke as if he were not certain there might not be a devil. Once after he had been thundering against certain particular evils which excited his wrath, I said: "We who believe in evolution regard all these as temporary arrests of development." "It might," he answered with a smile, "astonish you if I were to say where I believe these evils come from. Let us walk!" There was something in his manner which kept me from pressing the subject. He was now, however, in the year before his death,—a period when religious "survivals" are apt to show themselves. There were none of these, however, from which the orthodox could obtain any satisfaction. Even were it true that Carlyle inclined to suspect there might be a devil, it was at a period when theology had just explained the devil away. His disbelief of the Christian scheme was complete and final. Indeed, though myself a heretic, I have at times thought that Carlyle's character might have been more humanized had he felt deeper sympathy with the spirit which has imperfectly and superstitiously, yet with a true and tender sentiment, found its expression in the Legend of Jesus.

THE SITAHARANAM; OR, THE RAPE OF SITA.

AN EPISODE FROM THE GREAT SANSKRIT EPIC "RAMAYANA."

TRANSLATED INTO ENGLISH BY PROF. ALBERT H. GUNLOGSEN.

VI.

THE beautiful daughter of the King of Videha was set a-thinking by this gallant speech of Ravana; but at last she answered:

"I am the daughter of Janaka, the magnanimous king of Mithila—so may you ever prosper—and I am the wife of the noble-minded Rama. For a whole year I lived happy in Rama's dwelling, blessed with love, and enjoying all earthly pleasures.

"Thereupon, after more than a year, the old king, having consulted his ministers, made preparations for anointing my husband king.

"But the unworthy *Kaikeyi*,* as his favored wife, having wrung from my father-in-law the promise of granting her any first request, as the highest boon begged for the expulsion of my husband.

"I shall never rest," she said, "I shall neither eat nor drink, and it will be the cause of my death, if Rama be crowned. Be true, O king, unto your promise, and grant me the favor which you bestowed upon me a long while ago. Let my son, Bharata, be crowned, and still to day send Rama into the wilderness. At once dismiss Rama for the period of fourteen years to wear an hermit's clothing of bark and hides, and let my son Bharata be crowned."

"At these words of *Kaikeyi* my father-in-law entreated her with many touching words, and would not do her bidding.

"But my heroical husband, Rama, renowned in the world for his faithfulness and virtue, was only bent on the good of all his fellow-men, even although his father, the glorious king Dasaratha, from his infatuation for *Kaikeyi* did not order Rama to be crowned.

"When for the expected ceremony Rama went into his father's presence, my husband was addressed in the following words by *Kaikeyi* :

"Listen, O Rama, to my words! You have been banished by your father. To Bharata I give this kingdom, enjoying deep peace; but you must dwell for fourteen years in the wilderness. Depart therefore at once, O *Kakutsha*, and prevent your father from breaking his word."

"And then in his father's presence Rama merely assented to what *Kaikeyi* had spoken, neither remonstrating nor uttering an indecorous word.

"Such is the origin, O Brahman, of the generous and constant vow of Rama; and his half-brother, the hero *Lakshmana*, departed along with him as his companion and ally. *Lakshmana*, however, having suggested to Rama certain generous thoughts, the observant Rama at once replied: 'My soul shall ever adhere to what is true!' And thereupon he set out with me, and the noble *Lakshmana* followed us, bow in hand.

"And ever since, O holy Brahman, we three who forfeited our kingdom through the word of *Kaikeyi*, have been roaming about in the deep wood fearlessly; and now we live here in this forest full of wild animals. But you, be cheerful. You will be allowed to remain here until my husband returns, bringing with him a choice head of game from the forest.

"But now in your turn tell me in truth your tribe and family. For what motive, O Brahman, do you

roam alone in the wood of *Dandaka*? I doubt not that Rama will receive you well; for he loves all holy men, and speaks kindly to them."

To Sita thus speaking kindly, the *Raksha*, wounded by the darts of the god of love, replied as follows:

"Then listen, woman, who I am, whence I came, and mark well my words.

"Under this disguise there has come hither, of his own accord to see you, he who drove into flight the worlds along with the immortals and all the highest divinities. I am *Ravana*, the most powerful, and by whose command his brother *Kharas* holds this wood of *Dandaka*. I am a half-brother of *Vaisravana*.*

"I am a son of *Visravas*, a hero of the blood of *Orasa*,† and a grandson of the great seer *Pulastya*. By the self-existing *Brahma* I have been granted all the highest gifts; and I can move and change my form at pleasure. As *Dasagriva* I am also famous in the world and renowned through my valorous deeds—I am indeed *Ravana*, O *Sita* of the pure smile!

"Gazing at the lovely form before me, bright like a golden statue in your yellow silken dress, I have forgotten all love for my own wives. For I own, O daughter of *Mithila*, a large number of wives—all pretty women; and of all these in my eyes you shall be the only and supreme queen. *Lanka*,‡ the loveliest Isle of the Ocean, is my residence, surrounded by the sea. My castle is built high upon a mountain-peak, adorned with lofty battlements of beaten gold, and defended by deep moats; and within there are high-roofed palaces, in the three worlds renowned like *Indra's* residence in *Amaravati*.

"Such indeed is the grand abode of the dusky *Rakshas*—the work of *Visvakarma*, the skillful artificer of the gods, and measuring well-nigh thirty *Yojanas*§ in extent. Here, O *Sita*, you shall ramble contented with me through the pleasant groves, and never regret this savage wilderness. I shall crown you the queen of all the valiant *Rakshas*, and among all their comely wives you shall be the foremost. Five hundred female slaves shall attend on you; therefore, be my wife, O you fair one! I am *Ravana*—knowing all science, endowed with all sanctity—therefore love me!"

Thus addressed by *Ravana*, the graceful daughter of *Janaka*, burning with indignation contemptuously answered to the *Raksha* :

"But I purpose to remain true to my husband, Rama, who himself is firm like a mountain, and inaccessible like the vast ocean. Yes; I am devoted to a prince—a hero, to the illustrious, valiant Rama; and like a lioness the lion, so do I proudly follow Rama. You, on the contrary, only a vile jackal, how dare

* *Kuvera*, god of riches.

† *Orasa* or *Urasa*, the name of a district.

‡ The Island of Ceylon.

§ A *Yojana* was 5, according to others the distance of 8 miles.

* *Rama's* Stepmother.

you covet an unapproachable tigress? I could not be touched by you any more than could a sun-beam! You fancy to see a multitude of golden trees before you, O you wretched demon, when you think you are able to carry off the faithful and beloved wife of Rama. Any one who wished to carry off by violence the wife of Rama, might as well try to wring the prey from a strong, swift, and angry lion—the terror of the forest. Ah, you are licking with your tongue a sharp razor, you are pricking your eyes with a needle, when your impure mind dares to covet the beloved wife of Rama. Will you venture to wrest from a jealous tigress her brood, while attempting to bribe the beloved wife of Rama? You fasten a rock around your neck, and wish to cross the ocean. You wish to walk on the sharp points of iron-spears, such indeed you appear to me when you presume to molest the beloved wife of Rama. Would you carry burning embers in the folds of your mantle, thus thinking to carry off Rama's wife, blessed by fate? Or would you hazard to touch with your hand an angry, hissing, poisonous Krisna-serpent, thus daring to covet me?

"From you to Rama there intervenes all the distance from a jackal to a noble lion of the forest; from a drop of water to the vast ocean; from a noble Surastra* to a vile Sauvira—*that is the difference between you and Rama—the difference of beaten gold and black steel; of sandal-wood and a vase of vile clay. You resemble Rama no more than an elephant does a cat, or a crow does the Garuda-bird of Vishnu, or a peacock resembles a Lava-bird; † in one word, the difference between Rama and you is that of a crane and a vulture.*

"Therefore, relying confidently on my ever watchful hero, Rama, armed with bow and arrows, if even carried away by you, no evil would betide me, any more than if a pearl could be swallowed by a fly. It may have been possible to carry away Indra's wife, Saci, or even Uma herself, the wife of Siva; but I, the wife of Rama, could not be carried away by you, O Ravana."

Such was the reply of the virtuous Sita to the insolent words of the Raksha, and in the agony of her distress she trembled like a Kadali-tree, when stripped of all its sling-plants by a huge wild elephant.

But Ravana, inexorable like death, at the sight of her tears as a means of intimidation began relating all about his family, his power, and high deeds.

SELECTIONS FROM THE GERMAN.

TRANSLATED BY MARY MORGAN (GOWAN LEA).

x.

WHY, O why must wander ever?
Goodness compasseth us round:
Learn that happiness is never
Far, and always to be found.

—Gæthe.

* Names of certain Hindu tribes.

† The Lava-bird seems to be the *Perdix Chinensis*.

xI.

TO A ROSE.

YESTERDAY a little Rose-bud
Sleeping in moss-covered hill;
And to-day more lovely still,
All surpassing in thy beauty.
Wert thou dreaming in the night,
Of the miracles before thee?
Of the Spring-time bending o'er thee?
And the advent of the light.

—Chamisso.

xI.

EARLY SORROW.

LIGHTLY snow lies on the branches
Of the trees just come to leaf;
Lightly sorrow falls on musings
Of youth's hope untried by grief.
Speedily doth first snow vanish—
Soon as it the sun doth feel;
Early sorrow leaves a furrow
Which no after-joy may heal.

—Moritz Hartmann.

xIII.

O SPRING-TIDE, COME!

O SPRING-TIME, come! Let the green leaves unfold;
Awake within the hedge the wild bird's song;
Adorn the cheerless way-side all along
With bloom; and tint the fleecy clouds with gold!
When songs of mirth sound gaily from each tree;
In streamlets, rustle; and in hedge-rows, bloom;
Perchance my soul—grown solemn as the tomb—
Shall leave behind its dark dependency.

Yet, woe is me! Alas, if I must seek
My consolation from bliss passed away,
And vainly ask this hour that it shall part
For me the joy of which I no more speak.
O Spring, hath not thy gladness power to sway?
Must I be left unto my heart's complaint?

—Ernst Schultze.

LOVE'S INTUITION.

BY JOHN BOSS.

THAT sever thee and me are many lands,
Whose mountains, tow'ring heavenward, defy
My tardy foot; whose arid, shifting sands
By desert winds are wafted far and high,
Wide seas divide us, rivers swift and deep,
Yet hold we converse while the world doth sleep.

When I, at even's sympathetic shade
Steal forth, fleet messengers of thought I send
Abroad; and when they far enough have strayed
To meet some thought of thine, toward me they bend,
And, answering the love I sent to thee,
Bring sweet report that thou dost dream of me.

CORRESPONDENCE.

THOUGHTS ON THE BRUNO CELEBRATION.

To the Editor of THE OPEN COURT:—

THE Italian nation has at last achieved its own deliverance, has obtained its own freedom. For nearly twenty years it has enjoyed temporal and political liberty, and during that time has made strides which have placed it in the front rank of European nations.

But now, this Whitsuntide of 1889, comes the news that it has celebrated a greater deliverance. The outward freedom was complete; but now the declaration has gone forth of the independence of the mind and soul.

"*Viva la Libertà del pensiero!*" was the cry that rolled along the streets of the capital that is least of all associated with freedom of thought, and where still dwells the shadow of the ancient power of ignorance and suppression of all knowledge that can free the mind. But that power is under an eclipse: the light of knowledge and the glow of intelligence have come into men's minds, and ignorance, superstition, charlatany, and fraud must forever skulk within their haunts of darkness.

The scene recalled the events of 1870, for veteran Garibaldians were there, marching at the head of the long procession, amid vociferous cheers from a dense yet orderly multitude.

At the Vatican the event was appreciated in all its significance. One of the Ambassadors to the Papal court, and many families belonging to the clerical party, left the city in protest against the demonstration. Some busy clericals went round to the Cafés and tried to persuade the proprietors to close for fear of disturbances. This advice must surely have been given in order to provoke the hungry crowd to acts of violence. As it was, however, all passed off well.

The last three days—says a correspondent—the Pope has seen no one, and no longer goes into his garden. He has declared that the event was even more portentous than those of 1870, for at that time the temporal power only was attacked, for political and national reasons, while to-day it is his spiritual authority and moral influence—the only powers left to him—that are being overthrown. When the Pope takes views such as these, we may be sure that he feels his position seriously weakened.

Bruno was a philosopher, and above all things a searcher after truth. He was therefore a champion of free thought, and it is in this character that he is now receiving the somewhat tardy honors of the Italian nation. In his writings he dwells on his love for truth and wisdom, comparing it to the ardent passion, so often celebrated by poets, of a lover for his mistress. Indeed, he places his own divine ardor in the quest of wisdom far before the highest or purest earthly suit: and welcomes death itself, if that be the destined end of his fervent pursuit of wisdom.

*"Non temer, respond'io, l'alta ruina!
Fondo sicur le nubi, e muor' contento
S' il ciel si illustre morte me' destina!"*

Bruno's hostility to the church arose as a matter of course from a recognition of the thin and flimsy nature of the veil of morality thrown by the priests over their own utter selfishness and hypocrisy. As a writer in the *Antiquary* (London) for March, 1889, says of the period in which Giordano Bruno lived: "Perhaps in no age was religion less lovely than under the form of the Roman Catholicism of the sixteenth century, as presented in Italy. Indeed, in any real sense of the word, religion there was none. The church still existed, it is true, but it was the church in her political aspect. The Papacy itself had become half pagan. Virtue was at as low an ebb as religion. Men flattered and truckled for places, and women forgot all dignity and modesty in their anxiety to become the wives and mistresses of such successful mates. This state of affairs aroused Bruno's powers of wit and sarcasm, and he published his *Spaccio della Bestia Trionfante*,—the Expulsion of the Triumphant Beast. It was practically on account of this satire on the church—an unpardonable offense in the eyes of the Inquisition—that Giordano Bruno suffered martyrdom on the spot where his statue now stands.

The fact of his martyrdom has been doubted, but from the April number of the *Antiquary* there seems to be little if any doubt remaining. The principal evidence is a letter from Gaspere Schoppi, or Scioppius, who witnessed the event. Mersenne men-

tions Bruno as "*un athée brûlé en Italie*" in a work printed in 1624. The Imperial Ambassador Wacker, resident in Rome at the time, writes a letter to Kepler informing him of the event. The archives of the inquisition contain full records of the trial and sentence: which are confirmed by independent documents in the Vatican. The archives of *San Giovanni Decollato* contain a notice of Bruno's execution, dated in mistake Thursday, February 16, 1600. Thursday fell on the 17th of February in 1600, and this is the date given in the letter of Scioppius, and in the Vatican and Inquisition records. The enthusiastic commemoration of that Sunday is therefore justified. It honors a real martyr, a martyr for the truth, for liberty of thought, for real wisdom as opposed to the conventional hypocrisies of a surface morality,—and it testifies to the emancipation of a people, once the most priest-ridden in the world, from the bondage of ignorance, or of still more fatal false beliefs. No longer is Rome the city of the Popes: no longer can it be called a city of religious bigotry, if the temper of the people be such as is indicated by this demonstration.

Since 1870, as has been said, Rome and Italy have made vast strides. Yet vaster possibilities are opened up in the vistas of the future; and though Rome will never again be the seat of a ruler of the world, yet she may take a forward rank in the universal march of progress towards the truth, one, immutable, and eternal.

LONDON, ENG.

JOHN B. SHIPLEY.

NOTES.

The contribution by Mr. George John Romanes, occupying the first pages of our present issue, is offered in reply to the criticisms advanced by M. Alfred Binet, in the preface to his recent work, "*The Psychic Life of Micro-Organisms*." Although the principal passages in which the points of difference between these two gentlemen are emphasized, have been cited in full by Mr. Romanes, our readers will derive from the discussion much greater profit by a re-perusal of M. Binet's remarks, or, at least, by a recurrence to the note respecting the same in No. 97 of THE OPEN COURT.

"On Faith as an Intellectual Function" is the title of a little treatise of forty eight pages, by Robert Park M. D., which we have received from Messrs. Watts & Co. of London. Dr. Park styles his essay "a first contribution to a religion of eufidelity." Eufidelity is defined as "the positive aspect or status of the intellect in view of the agnostic philosophy.*** It recognizes in human nature itself the fountain and well-spring of morality and the divine idea.*** It finds upon science as the true criterion of rectitude of belief and aspires after truth, beauty, and goodness in theory and practice. This is religion in its essence, and with science it has no quarrel.*** Religion is essentially the binding together of people by a common knowledge of all that tells most and best towards the evolution and happiness of the race; the happiness depending upon the physical well-being, and the latter depending upon a knowledge of the laws of nature and their observance." The creed of the new church should consist, says the author, of a number of axioms; *e. g.*, 1) "Reason has the highest place in the economy of human faculties, and it is the clear duty of every one, each for himself, before abandoning reason for faith, to exercise reason in order that faith may not be mere credulity," and 2) "Faith is the co-ordination and organization of the mental and physical acts of life, in harmony with certain intuitive and acquired ideas as to a future state and a Supreme First Cause and man's responsibility as a moral being." Our readers may obtain from the statements given an idea of Dr. Park's propositions. Evidently "Agnostic Philosophy," as here used, is not the Agnosticism of Mr. Spencer.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXVIII. — Continued.

Raschke examined the parchment.

"Highly valuable," he exclaimed, "if it is genuine, as it appears." He hastened to the chest and examined the missal. "Probably the initial letters of the book will afford some evidence as to whether the missal was used in the cloister of Rossau," he said. "I regret that my knowledge of monastic customs does not extend to this test."

He opened the chest and took up the contents. Of the absence of mind which usually disturbed him nothing was to be observed: he looked round with sharp eyes, as if he were searching the dark words of a philosopher.

"Very remarkable," he exclaimed. "Only one thing surprises me. Has the chest been cleaned out?"

"No," replied Werner, irritably.

"The three companions of a century's repose are wanting—dust, cobwebs, and grubs; yet there ought to have been something on the inside of the lid or on the bottom, for the chest has crevices which allow of the entrance of insects."

He rummaged again, and examined the bottom.

"Under a splinter of wood there hangs a bit of paper."

He drew out a tiny piece of paper, and a deep shadow passed over his noble features.

"Dear friend, compose yourself, and be prepared for an unwelcome discovery. On this fragment there are only six printed words, but they are the characters of our time: it is a piece of one of our newspapers, and one of the six words is a name well known in the politics of our day."

He laid the bit of paper on the table. Werner stared at it without saying a word; his countenance was changed; it seemed as if one hour had done the work of twenty years of care.

"The things were unpacked by me and again put back; it is possible that the paper may have fallen in."

"It is possible," replied Raschke.

The Professor jumped up, and sought in great haste for his pocket copy of Tacitus.

"Here is the reading of the Florentine manuscript, comparison with the parchment sheets will throw light on it." He compared some sentences. "It appears an accurate copy," he said, "too accurate—awkwardly accurate."

He held the manuscript searchingly towards the light; he poured a drop of water on the corner of the parchment and wiped it with a towel; the next mo-

ment he flung towel and parchment to the ground, and clasped his hands over his face. Raschke seized the leaves, and looked at the damaged corner.

"It is true," he exclaimed, sorrowfully; "a writing that had been on the parchment six hundred years would leave other traces on the material."

He paced hastily up and down, his hands in his coat pocket, rubbed his face with the towel, and, perceiving his mistake, threw it away from him.

"I only know of one word for this," he exclaimed—"a word that men unwillingly allow to pass their lips—and that word is villainy!"

"It was a piece of vile and rascally knavery," exclaimed Werner, in a strong voice.

"Here let us stop, friend," begged Raschke; "we know that a deception has been intended; we know that the attempt has been made lately; and when we compare the place of the discovery and your presence here, we may assume as a fact, without doing injustice to any one, that the trick was intended to deceive you. Of the person who has practiced it we have only suspicion, well-grounded suspicion, but no certainty."

"We will make it certainty," explained Werner, "before the day becomes many hours older."

"Undoubtedly," replied Raschke, "this certainty must be obtained, for suspicion ought not to continue in the hearts of men; it destroys all ideas and thoughts. But the ultimate question remains: For what object was the deceit practiced? Was it the willfulness of a knave? If so, the wickedness of it is not, to an honorable mind, thereby lessened; yet it is not the worst kind of turpitude. But if it was deliberate malice with intent to injure you, then it deserves the severest condemnation. On what terms are you with the Magister?"

"It was deliberate malice to injure a man, body and soul," replied the Professor, with solemn earnestness; "but the doer was only the tool—the idea was that of another."

"Hold," cried Raschke, again, "no further; this also is only suspicion."

"It is only suspicion," repeated the Professor; "therefore I seek for certainty. When I wished to go to the country castle I was detained from day to day under trivial pretences; the Magister was absent not long ago for a day from the work which was entrusted to him; he excused himself on the score of illness, and as he was profuse in his excuses I was struck by a shyness in his manner. There was a wish to keep me here for reasons which you, in your sphere of feelings, can scarcely understand. It was hoped to attain this object by exciting the fanatical zeal with which I was afflicted, without entirely contenting it. Such is my suspicion, friend; and I feel myself mis-

* Translation copyrighted.

erable, more miserable than I have ever been in my life."

He threw himself on the sofa, and again concealed his face.

Raschke approached him, and said, softly :

"Does it distress you so much, Werner, that you have been deceived?"

"I have confided, and deceived confidence gives pain ; but in my sorrow I feel not only for myself, but for the destruction of another who belongs to us."

Raschke nodded his head. He again paced vehemently about the room, and looked angrily at the chest.

Werner rose and rang the bell.

"I wish to speak to Magister Knips," he said, to Gabriel, who entered. "I must beg him to take the trouble of coming here as soon as possible."

"How will you speak to him?" asked Raschke, stepping anxiously before his friend.

"I need so much consideration myself," replied Werner, "that you need not fear my violence. I also have been laboring under a disease, and I know that I have to speak to one who is more diseased than I."

"You are not diseased," exclaimed Raschke, "only shocked, as I am. You will say what is necessary to him, for the rest you will leave him to his own conscience."

"I will only say what is necessary," repeated the Professor, mechanically.

Gabriel returned, and reported that the Magister would call when he left the Museum in the evening.

"How did the Magister take the message?" asked Raschke.

"He appeared alarmed when I told him that the Professor was stopping at the inn."

The Professor had ensconced himself in a corner, but the philosopher left him no rest ; he kept talking to him about the occurrences at the University, and compelled him to take part by frequent questions. At last he expressed a wish to take a walk, to which the Professor unwillingly consented.

Werner led him through the gate of the city ; as they walked along he briefly answered the lively talk of his friend. When they came to the inn from which Ilse had got into the carriage of the Crown Inspector, the Scholar began, with hoarse voice :

"This is the road along which my wife escaped from the city. I came early this morning along this same road, and at every step I felt what is the deepest humiliation to man."

"Before her was light, and behind her darkness," exclaimed Raschke.

He talked of Ilse, and now thought of the commission which his children had given to their aunt.

Thus the afternoon passed. Werner again sat brooding in his room, when Gabriel announced the arrival of the Magister. Before Raschke hastened into the next room, he once more pressed the hand of the other, and, looking imploringly at him, said :

"Be calm, friend."

"I am calm," replied he.

Magister Knips had profited by the refining influence of the Court. His black suit had been made by a tailor who had the princely coat of arms above his workshop ; his hair was free from feathers, and his vocabulary had been replenished with new expressions of respect. He now looked furtively and defiantly around him.

Werner measured the man as he entered with a steady look ; if, before, he had had a doubt of the guilt of the Magister, he now recognized it. He turned away for a moment in order to struggle with his aversion.

"Examine this," he said, pointing with his finger to the parchment leaves.

Knips took a leaf in his hand, and the parchment trembled as he cast a shy glance upon it.

"It is another forgery," said the Professor ; "the reading of the first Florentine manuscript, and even the peculiarities of its orthography, are copied with a careful accuracy which would have been impossible to any old transcriber. The writing, too, betrays itself to be recent."

The Magister laid the sheet down, and answered, with hesitation :

"It appears undoubtedly to be an imitation of an old script, as the Professor has already discovered."

"I found this work," continued the Scholar, "in the tower of the castle in the country, inserted in that torn missal, laid in that chest, and concealed among old furniture. And you, Magister, have prepared this leaf, and you have concealed it in this place. That is not all. Long before, in order to put me on a false track, you placed the register of a chest in the old records ; you invented the figures 1 and 2 for the chests, and further, you yourself wrote the register in order to deceive me."

The Magister stood with lowered head, seeking for an answer. He did not know on what confession of others these deliberate assertions were grounded. Had the Castellan betrayed him ? Had the Sovereign himself exposed him ? Terror came over him, but he replied, doggedly :

"I did not do it."

"In vain do you seek to deceive me anew," continued the Scholar. "If I had not already sufficient ground to say to your face that you did this, your demeanor in the presence of this sheet would be ample

evidence. No sound of astonishment, no word of horror at such an attempt at forgery escaped you. What true scholar would look upon such a thing and remain silent, if his own conscience did not close his mouth? What have I done to you, Magister, that you should inflict upon me this bitter anguish? Give me some excuse for your action. Have I ever injured you? Have I ever aroused in you secret ill-will against me? Any reason that will make this abominable comprehension will be welcome to me; for I look with dismay on this depravation of a human soul."

"The Professor has never given me any ground for complaint," replied Knips, submissively.

"Nevertheless," said the Professor, "in cold blood, with indifference, with malicious levity, you have done your worst to me: it was wrong, very wrong, Magister."

"Perhaps it was only a jest," sighed the Magister; "perhaps it was only put in that way to him who prepared the writing. He only perhaps acted by the command of another, not by free choice, and not of his own will."

"What power on earth could command you to practice towards another so deliberate a piece of knavery?" asked the Professor, sorrowfully. "You yourself know right well what consequences this deception may have for myself and others."

Magister Knips was silent.

"I have done with you," continued the Scholar. "I shall say nothing of the plan which this falsehood was to serve, nor make any further reproaches concerning the injury that you have practiced towards a man who trusted in your honor."

He threw the parchment under the table. Knips seized his hat silently to leave the room.

"Stop!" exclaimed the Professor; "do not move from the spot. I must be silent as to what you have endeavored to do personally against me. It is not so much on account of this manuscript that I have sent for you. But the man whom I see before me, on whom I look with an abhorrence that I have never yet felt, is something more than an unscrupulous tool in the service of a stranger; he is an unfaithful philologist, a traitor to learning, a forger, and deceiver in that in which only honorable men have a right to live, a cursed man, for whom there is no repentance and no mercy."

The Magister's hat fell to the ground.

"You wrote the parchment strip of Struvelius; the trader has informed against you in your native city. Your writings are confiscated and are in the hands of the police."

The Magister still remained silent. He fumbled for his pocket-handkerchief and wiped the cold sweat from his brow.

"Now, at least, speak out," cried Werner. "Give

me an explanation of the fearful riddle, how any one who belonged to us could willfully destroy all that made his life noble. How could a man of your attainments become untrue to science in so despicable a way?"

"I was poor and my life full of trouble," replied Knips, in a low voice.

"Yes, you were poor. From your earliest youth you have worked from morning to night; even as a child you have denied yourself much that others thoughtlessly enjoy. You have in this way the secret consciousness of having obtained for yourself inward freedom, and a humble friendship with the great spirit of our life. Yes, you have grown up to be a man amidst countless sacrifices and self-denials which others fear. You have thus learnt and taught what is the highest possession of man. In every proof-sheet that you have read for the assistance of others, in every index of words that you have drawn up for a classical work, in every word that you have corrected, in every number that you have written, you have been obliged to be truthful. Your daily work was an unceasing, assiduous struggle against what was false and wrong. Yet more, and worse than that, you have been no thoughtless day-laborer; you have fully and entirely belonged to us; you were, in fact, a scholar, from whose learning many with higher pretensions have frequently taken counsel. You not only treasured in your mind a mass of rare knowledge, but you well comprehend the thoughts to which such knowledge gives rise. You were all this—and yet a forger. With true devotion and self-denial, you united malicious willfulness; you were a confidential and assiduous assistant, and at the same time a deceiver, bold and mocking like a devil."

"I was a tortured man," began Knips. "He who has lived otherwise does not know how difficult it is, in the service of science, to be ever following in the foot-steps of others. You have never worked for others who knew less than yourself. You do not understand the feeling that possesses one when others use haughtily, without acknowledgement and without thanks, what one has given them from one's own knowledge. I am not insensible to friendship. The Professor was the first who, in the last lines of the introduction of his maiden work, mentioned my name because I had been of use to him. And yet I have done less for you than any other of my old patrons. The copy which you then gave me I have put in the place of honor among my books. Whenever I have felt tired from my night's work I have read those lines; I have seldom experienced the like kindness. But I have felt the torment of having more knowledge than I had credit for, and I have had no opportunity to work my way out of my narrow sphere. That has been the cause of all."

(To be continued.)

BOOK REVIEWS.

THE PROBLEM OF THE NORTHMEN. A letter to Judge Daly, the President of the American Geographical Society, on the opinion of Justin Winsor, that "though Scandinavians may have reached the shores of Labrador, the soil of the United States has not one vestige of their presence." By *Eben Norton Horsford*. Published by the author for private circulation.

This effort by Prof. Horsford to resolve the Norse discovery and settlement of America out of its nebulous state into a set of fixed facts, with dates and locality fully determined, is, if not conclusive, the most powerful, as well as the most useful, that has yet been made. Said discovery is either altogether myth or tradition, or it is veritable history; too much has already been proven to admit of its being myth, hence but little more testimony is needed to bring it within the domain of authentic fact. The data of the discovery, the year 1000, is established, as is also the date of the visit of the first bishop appointed for the colony, Vinland, namely, 1121, which implies a settlement covering the intervening period, for as J. A. Blackwell states, in his notes to Mallet's "Northern Antiquities," "It certainly does seem strange—if we may rely on the Icelandic annals for the record of events occurring in Greenland—that a bishop should undertake such a voyage from a mere motive of curiosity." The next question is: Where was Vinland located? It is this that Prof. Horsford endeavors to answer.

Justin Winsor simply cites George Bancroft's opinion, in the words quoted on the title-page, and endorses it; it cannot be said that he has investigated the subject at all, although in preparing his imposing chapter, "Pre-Columbian Explorations," for his "Narrative and Critical History of America," he has ransacked bibliographies, American collections, and sources of all description to an extent so overwhelming as to have led any logical and candid mind straight to the facts. But the only conclusion he arrives at is the following: "It is still a doubt how far we exchange myths for assured records, when we enter upon the problems of Pre-Columbian explorations, which it is the object of the present chapter to discuss." Justin Winsor fully demonstrates his disqualification for writing on the subject, and also puts on record the fact that the Massachusetts Historical Society discouraged the erection of a statue to Leif Erikson, in Boston, "on the ground that no satisfactory evidence existed to show that any spot in New England had been reached by the Northmen."

Prof. Horsford is thus more than justified in his attempt to fix the location of Vinland. To ascertain this he first studies the descriptions in the Icelandic Sagas, of the climate, soil, vegetation, etc., of Vinland, and the experiences of the Norse colonists there, and states the result: "As to the fitness of *Labrador*, a region of rocky desolation, ice-bound for more than half the year, to be the *Vinland of the Northmen*, where according to the Sagas cattle did not need to be housed in winter, where grapes abounded and corn grew spontaneously,—a land of forests and meadows,—there is among students of geography no difference of opinion." Given that Vinland was *somewhere* on the Atlantic coast, and *not* in an ice-bound region, nor yet in a tropical one, it *must* lie within the limits of New England and the Middle States; and as this tract of country is distinctly indicated, under the names of *Norvega* and *Norumbega*, in three maps that the author adds to his work: "Ortelius, 1570; Solis, 1598; and Botero, 1603, the conclusion that Vinland and Norumbega are identical is not wide of the mark. One does not need to be told," he affirms, "that the *Norvega* in smaller type against the character that stands for a settlement is in the country which Leif called *Vinland*, and which centuries later was known as *Norumbega*. As I have for four years been engaged on the History of *Norumbega*, I do not propose to go into it here. This fragment is introduced merely to illustrate that this bit of comparative philology *alone*, to one capable of appreciating it, contains the solution of the problem of the Northmen."

Prof. Horsford next states confidently: "As to what impress may have been left by Northmen on the soil of the United States, that is not a matter of authority, but of what may be found by examination. Should it turn out after all, that the Landfall of the Northmen had been found, and also the site and remains of the houses Leif and Thorfinn built and occupied in Vinland, *what then?*" This landfall he claims to have found, and the least the public can do is to examine his evidence fairly and justly, before pronouncing judgment. Here is where it is: "If any one interested will walk from the junction of Elmwood Avenue with Mt. Auburn Street,—the residence of Prof. Lowell, in Cambridge,—a few rods down the street to Gerry's Landing, and then follow the ancient Bank Lane to the point of crossing the rivulet draining the eastern slope of Mt. Auburn into the Charles, he will be at the site of the objects of interest which had once been there, and which I had predicted might there be found. There are in the inequalities of the surface the remains of two long log-houses, and huts or cots,—possibly not less than five huts,—along a declivity of moderate grade, 'some nearer, some farther from the water,' as the Sagas say."

The work contains two fine heliotypes of the landing-place of Leif and Thorfinn, and charts of these sites, Charles River, and vicinity, prepared by George Davis and L. M. Hastings, Civil Engineers.

MARIE A. BROWN.

WORD STUDIES IN THE NEW TESTAMENT. By *Marvin R. Vincent*, D. D. Vol. II. New York: Charles Scribner's Sons. Chicago: A. C. McClurg & Co. \$4.00.

The work of Dr. Vincent, now professor of sacred literature in the Union Theological Seminary of New York, is a contribution to the critical study of the New Testament. It represents the labor of many years of research, conducted while Dr. Vincent officiated as pastor of the Church of the Covenant in New York City. It is not addressed to critical scholars, but is intended principally to illuminate the path of the English student of the English Bible. Prof. Vincent has collected and sifted from critical commentaries, lexicons, and etymological treatises, a mass of material relating to the study of Greek synonyms and the history, force, literal interpretations and relations of the words of the New Testament; he has divested all this of technicalities and thrown it in a form adaptable to the purposes of the English student. In the preface to Vol. I, the author says: "The present work is an attempt in a field which, so far as I am aware, is not covered by any one book, though it has been carefully and ably worked by many scholars. Taking a position midway between the exegetical commentary and the lexicon and grammar, it aims to put the reader of the English Bible nearer to the standpoint of the Greek scholar, by opening to him the native force of the separate words of the New Testament in their lexical sense, their etymology, their history, their inflection, and the peculiarities of their usage by different evangelists and apostles. The critical student of the Greek Testament will therefore find himself here on familiar, and often on rudimentary, ground, and will understand that the book has not been prepared with any design or expectation of instructing him. It has in view, first of all, those readers whose ignorance of Greek debars them from the quickening contact of the original words, and to whom is unknown the very existence of those tracks which the Greek scholar treads with unconscious ease and in clear light."

The present volume (Vol. II) is occupied with the writings of John—the Gospel, the Epistles, and the Apocalypse. The introduction, which is critical, biographical, and exegetical in character, is clearly and interestingly written,—within the mental reach of the layman and average Bible reader. The plan of typographical arrangement is well adapted for purposes of reference. The work will be an undoubted aid and valuable adjunct to students not thoroughly familiar with the language of the original text.

"THE MICROSCOPE,"
FOR 1889.

The leading exponent of Microscopy in the United States.

The representative of what is best, most instructive, and progressive in American Microscopy.

An enterprising and liberal purveyor of Microscopical News selected from the most reliable scientific journals of Europe and America.

A reliable teacher for the beginner, and a medium through which advanced workers publish to the world the results of their labors.

Among the contributors to this journal are:
Prof. CHAS. E. BESSEY, University of Nebraska.

Prof. T. J. BURRILL, University of Illinois.

Prof. M. D. EWELL, Northwestern University.

Prof. J. WALTER FEWKES, Harvard University.

Prof. C. H. STOWELL, University of Michigan.

Prof. S. H. GAGE, Cornell University.

Prof. H. L. SMITH, Hobart College.

Dr. ALFRED C. STOKES.

Prof. JOHN A. BRASHEAR.

Prof. HENRY MILLS.

Prof. H. M. WHELPLEY.

Dr. F. L. JAMES.

E. H. GRIFFITH, Esq.

C. M. VORCE, Esq.

And many other well-known writers on microscopy.

Each number is replete with information valuable to educated Americans who desire to acquire a scientific knowledge in its broadest sense.

MAKING BREAD DEAR.

A CONTROVERSY BETWEEN

WHEELBARROW AND SYMPATHIZER
UPON

Corners and the Board of Trade

WITH REFERENCE TO

THE LABOR QUESTION.

PRICE, 10 CENTS.

This little pamphlet is a reprint from the columns of THE OPEN COURT of an able and spirited controversy between Wheelbarrow and a prominent Chicago financier. The title indicates the subject. Wheelbarrow attacks the combinations of trade that "make bread dear and laborers cheap." Sympathizer declares Wheelbarrow's article a misrepresentation of facts, and characterizes it as misleading and obscure. Wheelbarrow replies, explains more fully his position, and contends that the arguments of Sympathizer have only strengthened the stand he has taken. The discussion is by practical men, and forms an interesting chapter in economics.

OPEN COURT PUBLISHING CO.,

P. O. Drawer F, CHICAGO, ILL.

TO ADVERTISERS!

For a check for \$20 we will print a ten-line advertisement in One Million Issues of leading American Newspapers and complete the work within ten days. This is at the rate of only one-fifth of a cent a line, for 1,000 Circulation! The advertisement will appear in but a single issue of any paper, and consequently will be placed before One Million newspaper purchasers or Five Million Readers. If it is true, as is sometimes stated, that every newspaper is looked at by five persons on an average, the line will accommodate about 75 words. Address with copy of Adv. and check, or send orders for Book of 258 pages.
GEO. P. ROWELL & CO., 10 SPRING ST., NEW YORK.

We have just issued a new edition of our Book called "Newspaper Advertising." It has 258 pages, and among its contents may be named the following lists and catalogues of Newspapers—
DAILY NEWSPAPERS IN NEW YORK CITY, with their Advertising Rates.

DAILY NEWSPAPERS IN CITIES HAVING MORE THAN 100,000 POPULATION, omitting all but the best.
DAILY NEWSPAPERS IN CITIES HAVING MORE THAN 20,000 POPULATION, omitting all but the best.

A SMALL LIST OF NEWSPAPERS IN which to advertise every section of the country being a choice selection made up with great care, guided by long experience.

ONE NEWSPAPER IN A STATE. The best one for an advertiser to use if he will use but one.
BARGAINS IN ADVERTISING IN DAILY NEWS papers in many principal cities and towns, a list which offers peculiar inducements to some advertisers.

LARGEST CIRCULATIONS. A complete list of all American papers issuing regularly more than 25,000 copies.

THE BEST LIST OF LOCAL NEWSPAPERS, covering every town of over 5,000 population and every important county seat.

SELECT LIST OF LOCAL NEWSPAPERS, in which advertisements are inserted at half price.

6,472 VILLAGE NEWS PAPERS, in which advertisement are inserted for \$2.15 a line and appear in the whole lot—one half of all the American Weeklies.
Book sent to any address for **THIRTY CENTS.**

LIFE - LORE :

A MAGAZINE OF POPULAR NATURAL HISTORY.

EDITED BY W. MAWER, F.G.S.

4 Essex Street, Strand, London, W.C.

The SUBJECT-MATTER is Life—Life in all its forms, plant and animal, from the "lowest" to the "highest," recent and extinct.

No. 1 WAS ISSUED JULY 1, 1888.

"A high-class scientific periodical."—*School Board Chronicle.*

"A decided advance upon its predecessors."—*Liverpool Courier.*

"Well printed, well illustrated, and ably edited."—*Printing Times.*

"An illustrated monthly magazine of great merit."—*Glasgow Herald.*

THE TEACHER'S OUTLOOK.

Published by The Teacher's Publishing Company, Des Moines, Iowa. A monthly magazine devoted to the interests of teachers and advanced pupils and intended to supplement the good work done by other school journals rather than to occupy the same field. Instead of filling its columns with school methods, school aids, and the details of school work, it will aim to interest the teachers in matters outside of the atmosphere of the school room, and its columns will furnish an Outlook upon affairs of life, facts in science and nature which illustrate and test the theories of the schools. In this work it will hope to furnish the teacher with a natural source of inspiration and mental energy, quicken thought and make the school room a place joyous with buoyant spirits that offer a responsive greeting to the inquiring minds of youth, rather than heavy with that gloom and dullness which often surrounds the daily toil.

A leading feature of the magazine will be a monthly review of current events, civil and industrial problems, scientific inventions, discoveries, etc.

Another feature will be a very complete Review of current Literature, especially of all books and magazines coming within the sphere of its labor. We have entered into arrangements with all the leading publishers to keep us informed of all their new and prospective publications, and the Reviews will be made by competent critics.

Still another feature, and a very important one as giving a practical value to the Outlook offered, will be the formation of a circle of writers out of our subscribers from which it hopes to draw its corps of contributors. This plan is original as applied to a magazine, and is based on the idea of co-operation, or mutual helpfulness. If met with that appreciation necessary to its full execution it will be the means of introducing many new writers to the public, and of aiding many who now lack the training in the expression of thought necessary the field of literature into which their tastes would lead them. \$1.50 per year. Sample copies 20 cts. Good pay to agents. 112

Secular Thought

A Journal of Liberal Thought.

The Official Organ of the Canadian Secular Union.

\$2 a Year. Published Weekly. Single Copy, 5c.

CHARLES WATTS, EDITOR.

31 Adelaide Street East, Toronto, Ont., Canada.

Read what Colonel Ingersoll says:

"I am greatly pleased with 'Secular Thought'—with its form, arrangement, and contents—above all, with its spirit. It is splendid. I don't see how it could be better. I read it with the greatest of pleasure."
Col. ROBT. G. INGERSOLL.

Read what Helen H. Gardner says:

"Permit me to congratulate you on the fine appearance and tone of 'Secular Thought.' I heartily congratulate our Canadian friends upon the fact that they are represented by a paper of which they can be justly proud, and which they need never hesitate to hand to their most delicate-minded friends, however religious they may be."
HELEN H. GARDNER.

"GERMANIA."

A Fortnightly Journal for the Study of the

German Language and Literature.

Subscription price \$3.00. Sample copies free.

A. W. SPANHOOFD,

Editor and Publisher.

P. O. Box 90.

MANCHESTER, N. H.

The Academy, Syracuse, N. Y.—We have before us the first four numbers of this new magazine, and feel justified in expressing the favorable opinion expressed by the daily press and some of our leading college professors of German..... On the whole, GERMANIA is well adapted to the private study of German, and we warmly recommend it to be welcomed by teachers as a pleasant companion to the usual text-books. Even at the present rates for single copies teachers will find in its columns varied and interesting reading for their classes at a reasonable rate. We urge all teachers of German to examine the magazine with this object in view.

THE Psychic Life of Micro-Organisms

A STUDY IN EXPERIMENTAL PSYCHOLOGY
By ALFRED BINET.

Translated from the French with the Sanction of the Author. Treating of the following subjects:

1. *The Psychology of the Cell—Introductory.*
2. *The Structural and Physiological Character of Proto-Organisms: the Motory and Sensory Organs.*
3. *The Psychology of Nutrition: Holophytic, Saprophytic, and Animal Nutrition: Predatory Habits of Certain Animalcula.*
4. *Colonies of Unicellular Organisms.*
5. *Foundation of Higher Animals and Plants.*
7. *The Physiological Function of the Nucleus.*
8. *Correspondence between Alfred Binet and Ch. Richet. (Professor of Physiology in the Faculty of Medicine at Paris) respecting Cellular Psychology.*

PRESS NOTICES.

*** "The little book will be no less than fascinating to all who are interested in the subject of comparative psychology." *** *Boston Beacon*.
*** "Intensely interesting." *** *Pharmaceutical Era*.
*** "We recommend the book to all earnest students of the great problems of evolution, as being unexcelled in the representation of modern biological investigations." *** *Reformed Quarterly Review*.
*** "The book will repay perusal." *** *N. Y. Medical Abstract*.
*** "This monograph is an original work and will add a new light to the vision of the scientist and general reader." *** *Toledo Blade*.
*** "A very remarkable book." *** *Health and Home*.

DEFINITIONS EXPLANATORY OF THE POSITION OF
"THE OPEN COURT."

THE DATA of experience are perceptions.

REALITY is the sum total of all that is.

TRUTH is the conformity of cognition to reality.

[Truth being a relation between subject and object appears to be relative in its nature. Absolute truth is a self-contradiction; it would imply cognition without a cognizing subject.]

At the same time it is obvious that absolute existence (in fact everything absolute) is impossible. Reality is properly called *Wirkllichkeit* in German, derived from *wirken*, to take effect. Reality is not immovable and unchangeable absoluteness, but the effectiveness of things in their relations. Reality therefore implies not only existence, but the manifestation of existence also. Existence and its manifestation are not two different things; both are one.

The idea of something absolutely Unknowable is therefore also untenable; it would imply the existence of an object whose existence is not manifested *i. e.*, existence without reality; *Sein ohne Wirklichkeit*—which is a contradiction, an impossibility.]

SCIENCE is the search for truth.

The nature of science is the economy of thought. (*Mach*.)

Economy of thought is possible through application of the laws of form to thought.

KNOWLEDGE is the possession of certain truths.

[Knowledge is, so to say, the present stock or capital with which Science works. Science cannot exist without knowledge. The object of Science is not only to increase and enlarge knowledge but also to purify the present stock of knowledge from vagueness, errors, and misconceptions.]

The purpose of knowledge is that of increasing our power over nature.]

MONISM is that philosophy which recognizes the oneness of All-existence, and the Religion of Monism teaches that the individual, as a part of the whole, has to conform to the cosmical laws of the All.

RELIGION is man's aspiration to be in harmony with the All.

[Religion has been defined differently in the columns of THE OPEN COURT, but all definitions that have been presented are in strict agreement. Mr. Hegeler in No. 25, defines Religion as "man's union with the All" (taking the definition from the Lutheran Catechism "Religion ist der Bund des Menschen mit Gott durch Gott," and replacing the Word GOD by the more comprehensive word THE ALL). The editor has defined Religion as "man's consciousness of his relation to the All" (No. 24); as "Das Allgefühl im Einzelnen," the All-feeling in the individual (see

foot-note page 965); as "man's conception of the world that serves him as a guiding-star through life" (page 1180).]

MORALS are man's conduct in so far as it is in unison with the All.

[The basis of morality is religion. A moral educator or preacher may justly be asked, "On what authority dost thou justify thy precepts?" And he will tell us that his authority is not personal; he speaks in the name of universal order. Accordingly his authority is that of religion. If it were not so, all his good precepts would have no foundation; they would hover in the air like beautiful dreams that have no reality.]

ETHICS is the Science of Morals; it teaches man why he must, and how he can, regulate his conduct so as to be in unison with the All.

Natural history and the history of mankind prove that here on earth a constant progress takes place developing ever higher forms of existence.

Morally good are those acts which are in harmony with the All, *i. e.*, those which enhance progress, and *morally bad* are those which are not in harmony with the All, *i. e.*, those which retard or prevent progress.

[Religion (man's aspiration to be in unison with the All) has naturally produced many superstitious notions in the world, of its origin, and of its purpose. Similarly, science (man's search for truth) has produced many errors or false notions of reality. But all the superstitions of religion do not prove that religion as such is an illusion, and all the errors of science are no evidence that science as such is a sham.]

It is obvious that religion and science, as here defined, are not contradictory, to but complementary of, each other. If religion and science do not agree, it is a certain sign that our conception of either the one or the other is wrong. The history of the human mind has been one of constant conflict and reconciliation between religion and science. Their relation has repeatedly been disturbed and re-adjusted.

The unitary conception of the world affords the only basis for the union of Religion and Science, and opens a new vista of progress for both.]

RECENT CONTENTS OF "THE OPEN COURT."

THE RISE OF THE PEOPLE OF ISRAEL.

[A masterly sketch of the history of Israel's people in the epoch of national organization; marked by critical acumen and a love of truth. The author, PROF. CARL HEINRICH CORNELL, is an orthodox theologian, of Königsberg, Germany. (Nos. 90, 91, 92).]

THE PHYSICAL BASES OF PERSONALITY.

[The second of a series of essays by the eminent French psychologist, TH. RIBOT. Translated with his consent from the "Diseases of Personality. An important contribution to modern psychology. (No. 93.)]

THE ELECTRICAL EXPERIMENTS OF PROF. HERTZ.

[The electrical researches of Prof. Hertz, of Karlsruhe, form one of the most important contributions to modern science. They show that electricity acts in the same way and according to the same laws as light and radiant heat. (Nos. 95 and 97).]

THE PSYCHIC LIFE OF MICRO-ORGANISMS.

[MR. GEORGE JOHN ROMANES replies, in this contribution, to the criticisms advanced by M. Alfred Binet in the preface of his work "The Psychic Life of Micro-Organisms," recently published by THE OPEN COURT PUBLISHING COMPANY. The discussion, from a psychological point of view, is extremely interesting and instructive. (No. 98.)]

CARLYLE'S RELIGION. WITH REMINISCENCES OF HIS TALK THEREON.

[In this article MR. MONCURE D. CONWAY has presented a number of important and hitherto unpublished facts bearing upon the religious belief of the great Scotchman. (No. 98.)]

POETRY AND SCIENCE.

BY PROF. CALVIN THOMAS.

It seems to be very generally believed that poetry has in our day lost somewhat of its former power and prestige in the lives of men. Who has not heard of our "modern prosaic age" and our dethronement of romance? Occasionally, to be sure, some one like the author of an article on "Our Noble Selves" in a recent English review, insists that the much lamented decadence of poetry is for the most part an illusion caused by lack of a proper perspective; and that we of to-day not only have as good poets as our grandfathers earlier in the century had, but actually care as much for poetry as they did. But this seems to be only the opinion of an optimistic few; the majority of those who discuss the question appear to look upon the decadence of poetry as a fact beyond dispute. And when they try to explain it they usually have recourse to the ever increasing prevalence and pressure of the scientific spirit.

It is argued, or more commonly it is simply assumed, that the genius of poetry and the genius of science are enemies. Poetry, we constantly hear, thrives on myths and marvels and seeks to perpetuate them, while science puts an end to them by explaining them in terms of every day fact. Keats proposed a toast in execration of Newton for destroying the poetry of the rainbow. Schiller elaborates the familiar theme in his poem "The Gods of Greece", mournfully contrasting our modern "whirling ball of fire" with the old "golden chariot of Helios." The idea of restoring to life its lost poetry and mystery was the starting-point of German romanticism; this it was which led a large number of men to turn their longing eyes back to the Middle Ages as a time when life had warmth and color as well as light; when the breach between faith and reason, superstition and scientific knowledge, did not yet exist. This same conviction of the flatness and prosiness of the present time in comparison with a more or less remote past, inspired much of the work of Thomas Carlyle. It seemed to him that the "Minerva press," the "diffusion of knowledge," and the increasing tendency to observe, analyze and discuss, were eradicating from men's souls the capacity for worship and admiration. Hence

that strange book of his upon "Heroes and Hero-worship."

But now when we look back calmly upon these solicitudes, how fantastic they appear. The poetry of the rainbow has not really suffered at all at the hands of modern physics. It has flourished just as well since Newton's time as it did before. Men may no longer believe in the myth of Iris, or in Elohim's covenant with Noah, but the poetry of the rainbow is still there. The myths themselves were forms of it and now the form has changed. That is all. The charm, or, if you will, the mystery of the bow in the clouds, is as potent as it ever was, in fact, is heightened rather than weakened by our scientific knowledge. Schiller deplored the *Entgötterung* of nature, because he thought, or feigned to think, that thus a beautiful well-spring of poetry had been lost; but he was himself the destined discoverer of new springs that, for him and his time, far more than made good the loss. Solar physics has not interfered with the poetry of the sky, nor has the loss of dryads, nymphs, and tritons destroyed the "divinity" of sea and land. We have from Goethe, Byron, Shelley, Wordsworth and Emerson a poetry of nature that touches the human spirit much more deeply, and tunes it to far finer issues than the old Greek myths ever did for those who believed in them. The period when the Romanticists were turning their weary eyes back to medieval Catholicism in search of poetry seems to us one of the most poetic epochs in history; it was the time of the Revolution, of the Napoleonic wars. Or again, if we look back to the era when Carlyle was thundering against the wretched "gigmanity" of his contemporaries, it does not seem to us especially unheroic. In fact, we see in Carlyle himself and in some of his London neighbors much more satisfactory "heroes" than several of those whom he saw fit to glorify.

It is impossible for those who live at any particular epoch to see it as it will be seen by those that come after. So as regards the prosaic, unromantic character of the present age, if we had nothing in evidence but the subjective impressions of men now living (even though they were our wisest men), we might rest assured that the much talked-of decadence of poetry is largely illusory. For if, looking out upon the actual

state of affairs in any country, say our own, which is generally regarded as the most prosaic in the world, we seemed to note a dearth of original, powerful poetic production, we should merely infer that poetry was then and there passing through a temporary eclipse and might be expected to re-emerge soon in all its old power and authority. But those who take the gloomier view of this question now usually profess to rely not on anybody's subjective impression, but on the general argument that science is hostile to poetry, and ours is a pre-eminently scientific age. Now our present concern is with the first clause of this argument and it does not lie in our path to look into the second very closely. If it did, we might perhaps find some reason to doubt whether ours is a pre-eminently scientific age in any sense which could greatly affect this question. As long as men keep learning more and finding new applications of the added knowledge, each age is in a sense more scientific than the preceding one. The French encyclopedists regarded themselves as the inaugurators of an Age of Reason, but they were not so. The Age of Reason dates back to the beginning of the human record, as does the Age of Religion and the Age of Poetry. Nevertheless it is hardly to be doubted that the last half of the nineteenth century has witnessed a general energizing of the scientific spirit. Authority began to count for less, investigation for more. Within the last few decades men have become familiar as they never were before not only with the practical applications of scientific discovery, but with the general *modus operandi* of scientific work. There are vastly more workers than there ever were before. And with increasing familiarity goes, in the main, increasing respect. The scientific spirit is in the air. It is by no means as universally diffused as is sometimes represented; but it affects the church more or less, the home and the school considerably, and every-day life mightily. It is slowly percolating through the mass of men and doing its inevitable work upon all the earlier presuppositions of human life. Thus the question whether the spirit of science and the spirit of poetry are essentially incompatible becomes a really interesting and vital one. If they are, it will not do to talk of an eclipse of poetry; we must rather suppose that it has entered on a real decadence and that its power and authority are destined to go on waning in proportion as those of science increase. How is it, then, with respect to this fundamental incompatibility?

Coleridge once said that the real antithesis of poetry is not prose, but science; and in commenting upon the words of Coleridge Mr. Theodore Watts, the writer of the excellent article on Poetry in the new Encyclopædia Britannica, makes this remark: "Indeed, with the literature of fact, as opposed to the

literature of power, poetry has nothing to do. Facts have no place in poetry until they are brought into relation to a human soul." Some confirmation of this general view appears to be afforded by the experience of Darwin. Readers of Darwin's autobiographical memoir will recall the striking passage in which he speaks of the gradual atrophy of his own interest in poetry and of his capacity for appreciating it. Is this case typical? Does it describe a necessary effect of the scientific spirit upon the mind's poetic susceptibilities? And if so, why? Here it would be natural to turn attention to Goethe as the great modern exemplar of the entire compatibility of the scientific and the poetic temperament. But let us instead approach the problem analytically.

Our reasoning upon this matter must depend entirely on our conception of poetry, which is, notoriously, a very difficult thing to define. Let one but make for himself some narrow and dogmatic definition of poetry; for instance, let him regard the whole art as subject to the canons which apply to particular types of the lyric, and he can easily reach the position of Coleridge. In fact, he can make his formulæ do any wonders *ad libitum*; especially if, like a recent writer in the *Saturday Review*, he has previously identified "science" in his own mind with the dissection of crayfish. But what gives anyone the right to proceed in this way? The conception "poetry" is, as Watts himself points out, fluid and changeable. It varies with different peoples and with the same people at different epochs. We can not distinguish it sharply from prose, or from metrical rhetoric; nor can we affirm with much unction whether it is more closely akin to music or to the plastic arts. If we attempt such distinctions, we are simply dogmatizing, and the next generation may throw our dogmas to the winds.

But without trying at a formal definition—and thus adding one more to the long string of failures from Aristotle down—we may at least say that three elements, or factors, are, more or less equally, more or less generally, associated in the minds of men with the idea of poetry; these are the formal, the inventive, and the psychical factors; for brevity let us say, the form, the fiction, and the message. These factors are distinct enough to be kept apart in thought, though in fact they often blend all but inseparably. The history of poetry is the history of the varying accentuation, in various forms of art, and at different epochs, of these three elements. Now it is the form, now the fiction, and again the message which most engages men's minds and seems to them to constitute the essence of poetry. But who shall tell us what this essence really is? Our English word "poet," from the Greek ποιέω, to make, accents the constructive formal element. As

a rule we give the name of poetry only to metrical language, and there are theorists who would make meter the one absolute *sine qua non* of poetry. This would require us to give the name to a rhymed multiplication table, which does not do the work of poetry at all, or does it to an infinitesimal degree, and at the same time to refuse the name to "Ivanhoe," which does the work of poetry in a very high degree. The German nomenclature is different. The verb *dichten*, from the Latin *dictare*, goes back to the Middle Ages when the poets, who often could not write, "dictated" their musings to an amanuensis. Thus the word came to connote most prominently the idea of "inventing," and to-day, as is well known, the title of *Dichter* belongs to a Dickens as much as to a Tennyson. So also *Poesie* is freely applied by the Germans to prose fiction. Even we talk of prose-poems and of poetical prose.

What is to be gained by refusing the name of poetry to a vast body of literature which does the work of poetry? If a piece of writing gratifies the instinct for beauty of form, if it presents a fiction that is eminently interesting, and if it contains a message which is the self-revelation of a highly gifted spirit, we have poetry in its highest manifestation. But if a piece of writing does any one of these in a high degree, without at the same time altogether neglecting the other two, it does to some extent the characteristic work of poetry. Beauty of form may relate to rhythm, to verbal expression, or to the symmetry of the whole. The fiction may have a wide range from a fleeting fancy to the tale of the "Divine Comedy." In the lyric it may on occasion be reduced to zero, since it is the nature of the lyric to be chiefly form and message. The message, too, admits of endless variety. Just now, indeed, we regard it as of the essence of poetry that its message be aglow with the warmth and color of personal feeling. We care for melody, sentiment, vision, and will not permit our poet to argue with us. With Pope and Dryden it was not so. They cared indeed for correctness, but they did not mind mechanical monotony, and they looked upon the appeal to reason as the supreme function of poetry. The exquisite workmanship and the labyrinthine sinuosities of impossible emotion which we now admire, or pretend to, would have seemed to them almost contemptible. Were they not then poets? Is logical, ratiocinative, didactic verse a "legitimate" form of art? If not, how are we to pigeon-hole Schiller's "Song of the Bell?" To talk of the legitimate in such connection is to talk of fashions.

Taking, now, this broad view of poetry, and a correspondingly broad view of science as trustworthy knowledge more or less systematized, and of the scientific spirit as that spirit which leads men to try to

get at trustworthy knowledge by using their wits to that end, let us shape our inquiry thus: If the scientific spirit is hostile to poetry, which one of the elements of poetry does it interfere with?

First, is it the formal element? Certainly not. As well contend that accurate knowledge of anatomy interferes with sculpture. The atmosphere of scientific knowledge is distinctly favorable to the mastery and to the appreciation of poetic form. The great masters of form have been men of learning. Milton, whose unflinching touch in matters of rhythm was held by Matthew Arnold to be his grand distinction, was at home in all the science of his day. Our own scientific age, whatever else may be said of its achievements in poetry, has nowhere allowed the formal element of it to deteriorate. It may be true that the scientific temper, caring as it does more for substance than for form, does tend to predispose the mind against poetry that is all form and without substance. But this is surely no very forceful indictment of science as an enemy of poetry. The modern bard who has only a manner of saying must e'en content himself to be neglected for the great ones of the past who had not only a manner of saying, but also something to say. The only point here insisted on is that the scientific spirit does not of itself incapacitate either the artist in shaping, or his public in enjoying, the purely formal element of his work.

Is it then the inventive element of poetry that is endangered by science? This again can hardly be argued. Invention does not count for much just now, except in prose fiction, and it seems to count for less and less even there. But it has counted in the past and may count again; and so far as it does count, it depends upon the same faculties of mind that are called into play in a great deal of the best scientific work. For science is not merely natural science, nor is this merely the patient dissection of crayfish. The real, characteristic work of the man of science begins with synthesis; it is the building up of a mental fabric out of all the data at hand, while the poet's is the building up of a mental fabric out of data selected by him for his purpose. For the poet imagines nothing, can imagine nothing, the elements of which are not data of Nature. His gods, and angels, and demons, his griffins, gorgons, and chimeras, and all their operations, are simply compounds of what he has seen and heard. Now the building up of such a mental fabric, whether it be science or poetry, is, where it has to do with concrete things, essentially a work of the constructive imagination. And this is true not only of such mental fabrics as the nebular hypothesis, the theory of a glacial epoch, or of the origin of species by natural selection, but it is true also in large measure of the historical sciences. The portrayer of a nation's

history, of a man, an epoch, a movement, needs *vision* just as the poet needs it. He must *see* his objects moving before his mind's eye, and, other things being equal, the excellence of his work as science will be in proportion to the vividness with which he sees. His procedure is that of an artist. The splendid portrait of Julius Cæsar in Mommsen's "Rome" is an achievement of the constructive imagination just as much as is Shakespeare's Cæsar. And each aims in its way at truth; the difference lies not in the way of working, but in the kind of truth aimed at. The scientific spirit may, though it certainly does not always, dispose the mind unfavorably toward wild and fantastic fictions in poetry, but it does not of itself interfere either with the use or with the appreciation of the constructive imagination. Does poetry on its own account any longer need wild and fantastic fictions?

It must be, then, in the message of poetry, if anywhere, that the seat of its antipathy to science is to be sought. And here undeniably the case for Coleridge's view is somewhat stronger. It is urged that the message of poetry is, properly, fervid, ecstatic, intuitive, deals with facts only as related to the human soul, and makes its appeal to feeling, fancy, imagination; while that of science is calm, ratiocinative, analytic, considers facts for their own sake, and makes its appeal to the reason. I am far from wishing to deny all validity to these antitheses, but it is easy to make too much of them. The old fictions of inspiration, divine *afflatus*, and so forth, undoubtedly have a reality back of them. That reality is a psychical state involving intense mental preoccupation, an exaltation or a sudden rush of feeling, and a heightened power of intellectual vision. But now, these states of consciousness are not the peculiar dower of a few; all men are more or less subject to them, which means that there are very many kinds and degrees of inspiration. The essence of the poet's message cannot lie in the fact that it proceeds from a more or less wrapt psychical state, since that is true of much other mental performance besides poetry, and is not always true of poetry. No one supposes that the opening lines of the "Æneid" were thrown off at a white heat any more than the opening lines of Macaulay's History. At most the language used above can apply only to the lyric mood and it does not always apply to that. There are good lyrics that are as calm and contemplative as the very Muse of Science herself. We must give up the idea that the power of the poet's message lies in his occasional mysterious inspiration. That mystery is, as with other brain-workers, very much a matter of business and of will. Goethe likens his own poetic ecstasis to a state of somnambulism; but the state lasted, while "Werther" was under way, for four weeks. This means that he could recall it each morning; and we know that in later life he be-

came something of an expert in "commanding his poetry." How, then, does the ecstasis of "Werther" really differ from that intense mental preoccupation with which he was wont, and with which many a man is wont, to pursue a purely scientific problem?

Largely illusory, too, is the distinction that science is literature of fact, while poetry is literature of power. As was remarked in another connection, it is not true that science considers facts for their own sake; it considers them as related to some further synthesis of the mind. Until we have that the facts are only the raw materials of science. And the same facts may be at the same time the raw material of poetry. Take the well known verses of Goethe:

" Ueber allen Gipfeln
Ist Ruh';
In allen Wipfeln
Spirstest du
Kaum einen Hauch;
Die Vögelin schweigen im Walde,
Warte nur—balde
Ruhest du auch."

No one will deny the fine lyric effect of these lines; if any one does, alas for his theories! But the first six lines are simply statements of fact. They are the raw material of either science or poetry, according to the nature of the mental synthesis to which they may be related by what follows. If the author had related them to some statement, say concerning the atmospheric conditions of Mt. Kickenhahn at a particular time of the day, they would have been science; as it is, he has related them to his own personality, giving us a glimpse of a perturbed soul longing for peace, and they are poetry. So impalpable is the line that divides the two; a word, a breath changes the one to the other.

But some one will say, not so impalpable after all; facts related to thought are science, related to feeling they become poetry. True in a sense, but the sense in which it is true does not take us far. Such terms as thought and feeling, mind and soul, fancy imagination, will, and what not, do not correspond to any separate air-tight compartments built by mother Nature in the human mentality. That mentality is one and indivisible. The states of consciousness to which we give these and other similar names have a common root and their branches are inextricably intertwined. What moves the one sways, or may sway, all the others.

I conclude, then, that the idea of any radical antithesis between poetry and science is at the bottom untenable. Poetry is in no danger of a general blight from the pressure of the scientific spirit. It may be that one can not be at the same moment under the dominion of the scientific and of the lyric mood. But he can be the one to-day and the other to-morrow; nor need his predilection for the one mood (unless he

deliberately starves half of his nature, as Darwin did and regretted doing) interfere with his appreciation of what belongs to the other. It is here much as it is with the far-famed conflict of religion and science. Not religion, only at the utmost religions, have anything to fear from the advancement of science, and the goal of the future is not the subjugation of one by the other, but a more and more perfect synthesis of the two. So it is not poetry, but at the most certain historical manifestations of poetry, that can be endangered by the onward march of the scientific spirit. Poetry and science have so far gone hand in hand and have played parts of equal prominence and value in the history of humanity. So it will be also hereafter; for both have their roots deep down in primal human instincts that are imperishable.

THE STRUGGLE FOR SALVATION.

BY P. MICHAELIS.*

PROF. WILHELM BENDER, of the university of Bonn, ranks at the present time, as a conspicuous reformer in German theological circles. Among his professional colleagues at least, he is to be regarded as the first who has earnestly endeavored, and succeeded in the endeavor, to construct anew the foundations of religion on the lines of modern science.

At bottom, there is nothing strictly new in what Bender says; it is new only for theology. Nearly the same thoughts, suggestively at least, are to be found in the works of Feuerbach and others; although the merit must be granted Bender of having once for all severed the anthropological character of religion from its dependence on philosophical speculation, and of having brought religion into firm connection with historico-critical methods of investigation. In other words, the attempt of Prof. Bender is, to bring religion, this highest form of the human mind's activity, like all other expressions of the mind of man, within the modern standpoint of evolution. This intention is evidenced in the very title of his latest publication, "The Struggle for Salvation,"† which plainly rests upon Darwin's "Struggle for Existence." This little monograph is admirably adapted as an introduction to the views of Prof. Bender. It is addressed to the cultured public of Germany and the entire world, and by no means exclusively to theologians. It will be our endeavor here, to present the salient points of this new conception.

* * *

The gifted anchorite of Bruckberg, Ludwig Feuerbach, in his work *Wesen des Christenthums*, was the first to advance the idea, that the true meaning of theology is anthropology; in other words,

that deity is only a copy, or, if it be preferred, an ideal copy of man. All that we predicate of God is a predication of human nature. All attempts to establish an essential difference between God and man are resolved into naught, so soon as we thoroughly investigate the problem by speculative philosophical methods. Religion is a dream of the human soul. The gods realize what men aspire after. "The gods accomplish," says he, "what men desire; that is, they fulfil the laws of the human heart. What men are only in soul, the gods are in body; what the former achieve only in volition, fancy, and heart, only spiritually, as it were—for instance, the power of being suddenly present at some remote spot—the gods can accomplish physically. The gods are the able-bodied, incarnate, and realized wishes of man—the obliterated boundaries that nature has placed on the human heart and will; they are beings endowed with unfettered will—beings whose powers of body are exactly equal to their powers of will. * * * The God of the Israelites, at the behest of Joshua, commands the sun to stand still; at that of Elijah sends down the rain; and so also the God of the Christians, as a signal proof of his own divinity, namely, of his power to grant all wishes to man, calms by virtue of his simple word the raging sea, heals the sick, and resurrects the dead. In all this the simple wish and simple word are proclaimed as a higher power controlling nature."

Feuerbach himself, from his extreme Hegelian point of view, had understood that religious life also was realized according to a definite law of development. Man wants to subjugate the world; man aspires to convert the unpropitious, uncanny character of nature into an intelligent, compliant factor in perfect harmony with all human cravings. But his views of the proposed aim must needs vary with the advancing growth of reason. So long as he remains himself a purely physical being, the objects of his worship are likewise physical objects. So soon as he has become a political being, his Godhead likewise becomes political, and wholly distinct from nature. In such case abstract, moral powers—the majesty of the law, the power of public opinion, of honor, and virtue—will be raised high above man's physical existence; while at the same time the empire of nature is lowered into a mere attribute and instrument of the political and moral power. Then does Zeus wield his thunderbolt, and inexorably strike down the offenders against his laws, all perjurers and evil-doers; then also Jehovah, amidst thunder and lightning, compels the Israelites to walk in all the paths that he has bidden them. In other words, whenever the will and reason of man have been raised above nature, his Godhead also must become a supernatural being. The absolute control of nature then becomes his loftiest conception, the

* Translated from the *Deutsche Gegenwart* by ג'ו'ן.

† *Der Kampf um die Seligkeit* (Bonn, Max Cohen & Sohn).

highest essence and object of all his worship and religion.

And thus man fictitiously imputes to the Godhead his own wishes and aspirations. He attributes to the world a particular purpose; views the world according to the laws of finality, and seeks in it for a living providence, disposing all things for his best welfare. The supreme control of the gods is thus narrowed, as man progresses, and the celestials themselves are, after a fashion, sublimated along with all human development. But, since natural providence, must always have its definite limits, so at all times there will still remain ample room for the Godhead. "The gods know and speak to me; they clearly determine all that nature leaves in darkness and uncertainty, and surrenders to chance. The domain of the fortuitous, of the positive, individual, unforeseen, incalculable, is the domain of the gods—the domain of religious providence. And oracle and prayer constitute acts of religious consecration, because man seeks to make what is fortuitous, obscure, and uncertain, an object of providence, of certitude, or of trust." Feuerbach thereupon sums up his entire theology in the very pregnant sentence: "The supersensual behind the sensual is man before the sensual."

That which less satisfies us in Feuerbach's ingenious and acute exposition is its decided speculative bias. It frequently looks as if actual facts were violently forced to enter the line of ideas that make up his system. And, besides, its amalgamation with a philosophical system is all the more to be regretted, since, with the overthrow of the latter, that also which is true in it, itself seems to have fallen in the general ruin. The circumstance, too, that in our own days a wide-spread repugnance to all philosophical speculation has extensively gained ground, explains why ideas of this kind have now for a time been neglected. It is therefore all the more a source of satisfaction, that these ideas, independently of speculative hypothesis, have now been tested exclusively by the truth which they contain, and solely by the formal application of valid scientific laws, as generally admitted in our day.

In this consists the first advantage that Bender enjoys over Feuerbach, to which may be added, that in our own time the comparative history of religion has made a very great advance beyond the point it occupied forty years ago. This particular province, formerly entirely neglected, is now being cultivated in numerous universities by very eminent teachers, and surprising facts are daily brought to light. Only from such results, doubtless, can be laid the genuine foundation of a serious discussion of the character of a religion that lays its main stress on man. For, however hostile to all history may be a view of religion

that exclusively rests on revelation, still an historical and anthropological investigation of the nature of religion is only imaginable under the assumption that such an hypothesis can be proved by historical facts.

It is not Prof. Bender's smallest advantage over his predecessor that he perfectly controls this religio-historical material, as might be shown from many details, although, of course, there is no intention of imparting this vast material *in extenso*, but rather to make it the basis of deeper investigation. In fact, this could not be done by aid solely of the available material of a few occidental religions; only more recent ethnographical investigations allow us a comprehensive survey of this luxuriant domain, and present at the same time to our view certain particular sides of religiousness, which, to the student, gain perhaps in value, even through the very oddness of their first aspect. Finally Prof. Bender agreeably differs from Feuerbach by his greater discretion.

Still Prof. Bender does not seem entirely fair when he maintains that he no more agrees with Feuerbach than with Schleiermacher, Biedermann, and others. For, as a matter of fact, it was Bender who first consistently disregarded the factor of the Godhead. But he justly guards against Feuerbach's rash inference regarding deity as a pure product of human wishes, and proves, on the contrary, that the belief in divinity rests upon very real foundations.

Science, Bender maintains, cannot regard as its aim either the creation or the destruction of the ideals of man. It is the office, sole and simple, of science, to understand and explain them; but we shall not be able to obtain a correct comprehension of religious life, if we start from a religious ideal which does not tally with reality. Such an ideal, however sublime, would be liable to be regarded as an empty reverie. On the contrary, we must point out the firm soil from which it grew in the history of the development of our race and in the laws of our own life, as still to-day it might grow there. The attempt to regard religion as something absolutely apart, as a phenomenon unsusceptible of comparison with any other, has been definitively proved a shallow conception. Prof. Bender adopts the very opposite methods. He endeavors to conceive religion as flesh of our flesh and bone of our bone; not diviner and not less godly; not better and not worse; not truer and not less true, than all the other spiritual activities of man; rearing indeed its head high into the sky, but with its feet deeply rooted in the common mother earth, from which all life springs. This, certainly, may destroy the dazzling aureole of holiness of which religion ever loved to make a pompous exhibition, but as an indemnification for the loss we may perhaps discover something which actually turns religion into a necessary

and victorious weapon of man in the struggle for existence. Prof. Bender aims to prove that *religion everywhere is a manifestation of the activity of man, and never of the activity of a deity*—in other terms, that the Godhead can claim no other and no greater share in the origin and growth of religion than the share assigned it by religious faith in the origin and development of all things in the world. And, scientifically speaking, this is really the only tenable point of view. So long as it is only mortal man who professes religion, and not God, so long also must we explain religion as we do all other human things. Any other explanation accepting the auxiliary addition of a “supernatural” influence, has, to modern science, entirely lost all intelligible meaning.

Every form of human activity, all human civilization, from agriculture and practical handicraft to art, science, law, and morals, must be conceived and understood as a grand reciprocal action between the world and man. And that religion, evidently, must stand in the self-same relation, sufficiently appears from the fact that historically it is intimately interwoven with the life of the world. We cannot avoid regarding it otherwise than as a natural phenomenon, accompanying the advancing stages of human culture; as *one* weapon among the many other weapons, which man lays hold of in his unflagging struggle for existence. Nay, even when in certain aspects and forms religion appears to detach man from the life of the earth, it still continues faithfully in his service; for religion then holds forth to man the hope of that salvation and bliss, in a higher world, which he seeks for in vain on this earth. Yet the necessary disposition of things, according to which this reciprocal action between the world and man takes place, constitutes precisely the so-called struggle for existence. In this way only are obtained, preserved, and propagated the beneficent acquisitions of human civilization. All human society is developed and perfected in this struggle for existence. But man would not continue the struggle if existence afforded him no pleasure; if from the struggle he did not expect to derive an increase of his possession, of his strength, the satisfaction and felicitation of his personal being.

Thus, not only does the instinct of self-preservation, but likewise an instinct of self-improvement in harmony with the laws of nature, forcibly thrust the requisite arms into the hands of society, and teach it to use those weapons to the advancement of the common weal. And from out of this universal combat for existence, as a pure necessity of nature, there arises the ideal of a more perfect condition of life, which, though its realization be postponed to the end of all time, yet constantly hovers above human society like a star of guidance.

We have to understand, and bear in mind this truth, if we wish to understand the origin and development of religion. For, just as religion itself was born from out this struggle for existence; as it adapted itself unto all the forms that this struggle assumed in the course of the development of the human race; as it actually sprang from the same motive elements from which civilization sprang; so likewise religion ever served, and still serves the same objects that make for and condition the advancement of human civilization. Rightly understood, the ultimate aim of religion, in fact, is the improvement and happiness of human society. Religion has ever adapted itself to all interests and purposes, to every means and institution that man, according to his respective stage of culture, was compelled to adopt and employ.

In man's earlier stages of social development his most vital interests were centered in the preservation of life and health, of possession and family; in success in the hunt and in war; and all these, moreover, were the main objects of his religious worship and of his most ardent invocations. In a like manner, in our own day, to the immense majority of human beings the provision of food, clothing, and shelter forms the principal object of all labor, and at the same time of their sincerest prayers. If this truth has often been overlooked, the oversight must be imputed to the supernatural character of our education; for it is unquestionably true that our most passionate supplications uncontrollably well forth from the combat for life in which we are constantly involved: when our toilsome efforts are threatened with failure, or some windfall of fortune brightens our paths; when some beloved fellow creature is seen struggling with an insidious disease, or when mighty nations rise to fight the battle of existence with weapons in hand. And religion in the same manner accompanies the human struggle for the possession of purely ideal goods, upon the care of which the preservation and progress of society are in no less degree dependent. For man everywhere wishes for the success of his work, and is animated by the hope, that his efforts may be accompanied by success. But this wish in itself is only the elementary form of religion. Every single effort or task affords a motive for the creation of a religion; for our work does not only and exclusively depend on ourselves, but far more on all the fortuitous external circumstances amidst which our efforts are made. In so far, accordingly, as religion is only an ardent wish for success, it primarily lacks a definite content, and it only acquires the latter through the interests that man wishes to realize.

From all this we may gain a sufficiently clear insight into the primeval rise of religion. That which man aims at obtaining, is never entirely dependent upon his own laborious efforts, but upon external cir-

cumstances and conditions of existence, which we fail perfectly to perceive and to control. Man, indeed, in the course of the development of civilization makes astonishing progress; in the struggle for existence he learns to employ more and more perfectly the weapons at his disposal; and so, by the very development of civilization itself the domain of his wishes becomes limited,—indeed, with the form of our civilization changes likewise the form of our wishes. Still, there always will be left a considerable remnant of incalculable possibilities, and at all times there will also exist a motive for the creation of a religion; in other words, man, through his aspirations and wishes, will never cease to endeavor to correct the extant deficit between that which he wishes and that which he has.

Nevertheless, this wish for success, must primarily be regarded as only the soil on which religion grows. Here a further question arises: Under what conditions does this wish adjust and mould itself into faith and worship, into all that which in the strict sense of the word we are accustomed to call religion? For although many may not have passed beyond that elementary form of religion, yet, as a rule, the urgent cravings of their own needs, and the pressure of the surrounding conditions of existence will lead much farther. The vague and erratic desire for help will regulate itself according to the standard of experience which man acquires in the struggle for existence. Therefore man turns to the world of reality and seeks in it for his gods. His god simply means helping power, supreme assistance. Concrete beings, whose preponderating influence he long has experienced, become the exclusive objects of his worship—the sun, earth, lightning, plants, and animals, and gifted individuals; in fact, all that might be expected to help him in the struggle for existence. Unto all such he might sacrifice and pray, and adapt himself, not from any theoretical conviction of finding in them higher beings, but purely in the practical expectation, that in their turn they likewise will adjust themselves to his own life interests, and will promote them. In this manner the religious evolution of man is not purely arbitrary, but like the advance of civilization, a reciprocal action with the world. Man prays for help to the Godhead to satisfy the natural and temporal interests of existence; and the controlling forces and regulations of nature and of history mediate between man and divine assistance. The province of religion and the work of civilization are coincident.

In a like manner also the development of religion is analogous to the course of evolution of human civilization. Religion indeed does not call forth the progress of civilization, but, on the contrary, an advance in the development of civilization actually causes the transformation of religious faith. Science

manifestly has transformed all religious faith. By teaching a correct knowledge of the forces and laws of nature science destroyed natural religion. Science further divested the legendary heroes of their divinity while showing how all, even the noblest and most beneficent personalities of history, one and all, are subject to human limitations and to earthly finiteness. Still, as science alone cannot produce civilization, neither does it determine the progressive development of religion. We ought rather to assume that all forces co-operate to effect this end. In every stage of civilization they, taken together, create some peculiar ideal of existence, in which all interests are represented as satisfied, and all aims as having been successfully attained. And each life-ideal is again reflected in the idea of a supreme power, which controls the universe to the sole advantage of that ideal, and warrants for its realization. This ideal changes incessantly, along with the successive stages of civilization by which it is conditioned and called forth; but in each stage such an ideal is indeed the necessary result.

This, in brief, is what the author understands by natural religion. He thereupon shows that supernatural religion, seeking to relegate the realization of human aspirations to another world, simply arose from man's despairing of a successful consummation of that earthly struggle for existence. While subjecting supernatural religion to a searching criticism, the author proves that to our modern state of knowledge this kind of religion has forever lost all intelligible meaning; our faith and religion, on the contrary, ought in turn to accommodate themselves to the life-ideal, which some day must be realized in the whole of humanity. The dead religion, which, by aid of supernatural forms of faith and of works, pretends to open a phantastic beyond, must soon be transformed into a living religion that adapts itself to the noble struggle which man even here on earth must endure for the sake of his eternal salvation.

THE SITAHARANAM; OR, THE RAPE OF SITA.

AN EPISODE FROM THE GREAT SANSKRIT EPIC "RAMAYANA."

TRANSLATED INTO ENGLISH BY PROF. ALBERT H. GUNLOGSEN.

VII.

At this passionate and harsh speech of Sita, Ravana knit his brow and answered:

"But I am Ravana, O you woman of noble descent; I am the powerful Dasagriva, from the face of whom all gods have fled in terror—all Gandharvas, Pisatchas, and reptiles.

"My own half-brother, the wealthy King Vaisravana, even without a motive by me, was felled in

battle; from fear of me having abandoned his royal residence, and ventured to confront my anger.

"King Naravahana*, as is known, dwells on Mount Kailasa, noblest of mountains; and from him my valor won my splendid self-moving chariot, called Push-paka, on which I ride through the air.

"At the mere sight of my angry face, O daughter of Mithila, the ten regions of the world hide themselves from fear; and even God Indra, with all his furious host of Suras, boasting to be a match for Ravana, were once by me defeated in battle; and whether armed with the fetters† or without them, Varuna, the lord of the waters, went away vanquished by my resistless strength.

"Even Yama,‡ armed with his black bludgeon—a deadly weapon in battle, was by me driven far into the southern regions; and from fear of me he never since has even ventured to stir.

"All those kings of the earth, with all the gods at their head, before my presence from abject fear will scatter in every direction.

"Wherever I come the wind is hushed into calm; and I can chill even the burning sun-beams, so that they grow pale and cold. Where I move or stop, the leaves of the trees cease to quiver, and the rivers cease to flow.

"Far off in the sea lies my stately residence, Lanka, an abode worthy of Indra's Amaravati, crowded with my bold Rakshas. It is surrounded by extensive bright walls, with gilded turrets pleasant to the eye; with arched gates of lazur-stone and adamant; rich in elephants, horses, and chariots, resonant with strains of music and adorned with groves of trees, bearing all kinds of costly fruit.

"There, O Princess Sita, you shall dwell with me, in happy oblivion of all men and women; and enjoying all human and divine pleasures, you also would soon forget Rama, himself but a mortal man. His father, King Dasaratha, having placed his favorite son on the throne, sent his elder son into the wilderness, as one of much inferior valor.

"And what could you expect to do with a fool like Rama, exiled from his kingdom, and moreover a penitent?

"Therefore, do not repulse from you the lord of all Rakshas, who, wounded by the darts of the god of love, of own free impulse has approached you. But, if you do reject me, O my fair girl, a great evil will surely betide you!"

Thus entreated, Sita, incensed with wrath, with reddening eyes scornfully spurned him from her with her feet, as is said the Apsaras Urvaci once did with

Pururavas;* and there in the solitude she further addressed the following angry words to the lord of all Rakshas:

"And you, who treacherously slew your own brother, King Vaisravana, endowed with every high quality, have you again come hither to perpetrate evil?

"Be sure, O Ravana, that the Rakshas, of whom you are the wicked, foolish, sensual king, must needs all perish.

"Indra, forsooth, might live, although losing his wife Saci, but were I to be carried away, Rama, certainly, would die; and you, O king of the rovers of the night, after robbing Indra's wife Saci, may have preserved your own life; but in committing this evil deed against Rama, you will surely perish—even were you the God of Death himself!

"Hard pressed in battle by the entire host of Brahmins and Siddhas,† you shall be hurled to the infernal regions of the god of death Yama, struck by the flaming arrows of Rama."

NOTES.

The first of the essays of M. Binet, treating of the psychology of various forms of hysteria, will appear in our next issue.

Life-Lore begins, with July, its second year. The success of this popular magazine of Natural History has been merited. The character of its illustrations and content-matter is exceptionally high, and has ensured it in the past, as we hope it will do in the future, a wide-spread circulation. (W. Mawer, London.)

In conjunction with the essay of Prof. Calvin Thomas, "Poetry and Science," may be read the editorials "Classical and Romantic Art" and "Tragedy and the Problem of Life," in Nos. 46 and 48 of *THE OPEN COURT*. *THE OPEN COURT* would not compose the conflict between poetry and science by broadening the scope of art, but rather by limiting it and by excluding every tendency to Romanticism as an expression of dualism.

The theory of Max Müller, of the identity of language and reason, set forth in his recent works upon the Science of Thought, has in almost every instance in which the view has been combated, been grossly misunderstood. Critics refuse to accept the definition of thinking as a process of adding and subtracting, of combining and separating; they make the term embrace almost every psychological act, every act that is predicable of life, sensations, passions, intuitive judgments, etc., and then proceed coolly to annihilate a doctrine which they have virtually themselves erected. Thus Professor David Swing, in the *Chicago Evening Journal*, of July 6th, writing of the wondrous mysteries of "Conscious Life," incidentally refers to the doctrine of the identity of thought and language in a similar fashion. Professor Swing cites the action of fishes in seeking the friendly hand that feeds them as conclusive evidence that fishes think; and clinches his proposition by the remark that "thus the question which has long puzzled philosophers can be settled by a two-year old sun-fish." Prof. Swing's article is a charming study in imaginative natural history. But even speculation has its limits, and it is hardly reverential, much less scientific, to maltreat a philosophical truth merely to adorn a popular tale.

* Naravahana is another name of Kuvera, God of Riches.

† "The Fetters" relate to the manner in which Indra and the Suras overpowered and bound Ahi, the world serpent.

‡ The God of Death.

* The story of Pururavas (son of Budha) and of Urvaci, is told in the Vishnu Purana, 399.

† Siddhas, a class of demi-gods. In this cl̥ka or strophe, the words "Sriyam-ihā vipulan vihaya raudrim" have provisionally been omitted.

THE LOST MANUSCRIPT.*

BY GUSTAV FREYTAG.

CHAPTER XXXVIII. — Continued.

The Magister suddenly stopped.

"It was pride," said the Professor, sorrowfully, "it was envy, that burst forth from an oppressed life against more fortunate ones, who, perhaps, did not know more; it was the craving for superiority over others."

"It was that," continued Knips, plaintively. "First came the idea of mocking those who employed and despised me. I thought, if I chose, I had you in my power, my learned colleagues. Then it became a purpose and took fast hold on me. I have sat many nights working at it before I went so far, and frequently have I thrown away what I have done, Professor, and hid it under my books. But I was allured to go on, it became my pride to master the art. When at last I had done so, it was a pleasure to me to make use of it. It was less for the gain than for the superiority it gave me."

"It is easy," replied the Professor, "to deceive men of our sort where they are accustomed to place firm confidence. Where the acuteness that we acquire in our work is not brought into play, many of us are like children, and he who is colder and wishes to deceive may easily for a time play with us. It is a weak glory to exercise the art of Satan against the innocent."

"I knew that it was a devil with whom I was dealing; I knew it from the first day, Professor, but I could not guard myself from him. Thus it was," concluded Knips, seating himself exhausted on the chest.

"Thus it was, Magister," exclaimed Werner, raising himself up; "but thus it cannot remain. You were one of us, you can no longer be so. You have done an injury to the highest good which is granted to the race of man—the honor of learning. You yourself knew that he who endangers this honor is a mortal enemy to our souls. In our realm, where error daily threatens the limited powers of individuals, the determination to be true is a preliminary which none can be wanting in, without involving others in his own destruction."

"I was only an assistant," sighed Knips, "and few cared about me. If others had esteemed me as a scholar it would not have happened."

"You considered yourself so, and you had a right to do so," rejoined the Professor. "You felt the pride of your learning, and you well knew your high vocation. You well knew that you also, the humble Magister, had your share in the priestly office and in the princely office of our realm. No purple is nobler, no rule is more sovereign than ours. We lead the souls of our nation from one century to another; and

ours is the duty of watching over its learning and over its thoughts. We are its champions against the lies and spirits of a past time which wander amongst us clothed with the semblance of life. What we consecrate, lives; and what we condemn, passes away. The old virtues of the Apostles are required of us—to esteem little what is earthly, and to proclaim the truth. You were in this sense consecrated, like every one of us; your life was pledged to God. On you, as on all of us, lay the responsibility for the souls of our nation. You have proved yourself unworthy of this office, and I grieve, I grieve, wretched man, that I must separate you from it."

The Magister jumped up, and looked imploringly at the Scholar.

The Professor spoke impressively:

"It is my duty both towards you and others to speak out. What you have done to my fellow professors, and what you have prepared for similar attempts, cannot remain secret. Honorable men must be warned against the art which you have been led by a demon to exercise. But in this last hour in which you stand before me, I feel that I have done too little to help you against temptation. Without intending to be unkind, I have perhaps sometimes undervalued you, in comparison with others, and have forgotten how hard was your daily life. If you have ever felt depressed and embittered by my severity, I now atone for it. For when I, short-sighted, erring man, advised you to accept a position which was to raise you out of external need, I participated in your guilt, by exposing you to new temptation here. That gives me bitter pain, Magister, and I feel the anguish of this hour."

Magister Knips sat exhausted and cowering on the chest: the Scholar stood over him, and his words sank like blows on the Magister's head.

"I cannot conceal the fact, Magister, that you are a forger; you can never again move in our circle; your career is closed by your transgression, you are lost to learning, lost to all who took an interest in your work. You have vanished from the place which you held amongst us; nothing remains but a black shadow. Human powers laboriously trained, a spirit of uncommon acuteness and fullness, are lost and dead to us; and I mourn over you as over a dead man."

The Scholar wept, and Knips covered his face with his hands. Werner hastened to his writing-table.

"If you require means to maintain your ruined life in some other neighborhood, here it is. Take what you require."

He threw some money on the table.

"Try to conceal yourself where no member of our community will meet you. May all the good become your portion, which is still possible for you to have

* Translation copyrighted.

on earth. But fly, Magister; avoid those places where one shall think of you with the sorrow and repugnance that the faithful workman feels towards one who is untrue."

Knips rose; his face was paler than usual, and he looked distractedly about him.

"I need no money," he said, with faint voice; "I have enough for my journey. I beg of the Professor to care for my mother."

The Scholar turned away, the strong man sobbed. Magister Knips went to the door; there he stopped.

"I have the Homer of 1488; tell my mother to give you the book. Though the thought of me be painful, yet keep the book. It was a treasure to me."

The Magister closed the door and went slowly out of the house. The wind drove through the streets; it blew against the back of the Magister, and hastened his steps.

"It drives," murmured Knips again; "it drives me onward."

At the open square he remained standing in the wind; looking towards the clouds, which were passing in hasty flight beneath the moon. Distorted figures hovered in the grey vapor and glided over his head. He thought of the last proof-sheets which he had read in his native town, and spoke some Greek words; they were verses from the *Enumenides* of *Æschylus*:—

"Rush on! rush on! rush on! ye messengers of vengeance!"

He went up to the castle, and remained standing before the lighted windows; the four black steeds which brought the Sovereign back from the tower castle to the city dashed past him, and he clenched his bony fist at the carriage. He then ran round the castle to the park side. There, against a tree, beneath the windows of the Sovereign's apartment, he cowered; looked up to the castle, and again raised his fist against the lord of it, and sighed. He looked up at the dark boughs that towered over him, gazed at the sky and the grey flitting shadows which coursed along under the moon, and desperate thoughts passed through his mind:

"When the moon vanishes that will be a token to me also."

He looked long at the moon. Amidst his wild thoughts a Latin sentence entered his confused brain: "The moon and the earth are but as little points in the universe;" that is beautifully said by *Ammianus Marcellinus*. I have compared the manuscripts of this Roman; I have made conjectures on all sides with respect to his mutilated text; I have pored for years over him. If I do here, in order to vex this ignorant lord, what was done to Haman, all this preparation for my Roman would be lost."

He rushed from under the trees and ran to his dwelling. There he collected all his possessions, put

his small copy of *Ammianus* into his pocket, and hastened with his bundle to the gate.

They say he went to the same country to which his brother had gone before him—far off in the West.

He passed away, he hid his head—an unfaithful servant, and at the same time a victim of science. All his life long he had pondered over written words; now the living words, which penetrated from another soul into his, drove him from his home. Day and night he had been surrounded with the letters of books and learned writings which had flowed from the pen on to the white sheets; but the blessing of living words which pass from the mouth to the ear, and echo from heart to heart, had failed him at the right time; for what is in common use with us is also our highest boon. Its power is as mysterious to us to-day as it was to our ancestors; the generation of our literary period, accustomed to contemplate tones in their imaginations, and to estimate the powers of nature by measure and weight, seldom think how powerfully the echoing word from the human heart rules within us; it is mistress and servant, it elevates and annihilates us, it produces disease and health. Happy the living being in whose ear it sounds full and pure, who incessantly receives the soft sound of love and the hearty call of friendship. He who is deprived of the blessing of the conversation which flows from warm hearts, wanders among others as a living being in whom the spirit is separated from the body, or like a book that one opens, makes use of, and puts away at pleasure. The Magister had sinned by the written word; a cry of agony uttered by a human voice had frightened him into the misty and silent distance.

CHAPTER XXXIX.

BEFORE THE CRISIS.

THE cattle lowed and the sheep-bells tinkled, and the springing blades of wheat waved in the wind. The eldest daughter of the family was again walking in the garden, surrounded by her brothers and sisters. What has become of the glad brightness of your eye and the hearty child's laugh, Lady Ilse? Your countenance has become serious and your demeanor subdued; your looks scan critically the men about you and the paths that you tread, and calm commands sound from your lips. Your home has not made your heart light, nor given you back again what you lost among strangers.

But it zealously exercises its right to be loved by you and to show you love; it recalls familiar images to your soul, and old recollections awake at every step; the people whom you fostered faithfully in your heart, the animals that you cared for, and the trees that you planted, greet you, and labor busily to cover with bright colors what lies gloomily within you.

The first evening was painful. When Ilse, accompanied by her neighbor, entered her home a fugitive, striving to conceal what tormented her, amidst the terror of her father and the inquisitive questions of her brothers and sisters, anger and dismay once more threw their black shadows over her. But on the breast of her father, under the roof of a secure house, together with the feeling of safety, her old energy revived, and she was able to conceal from the eyes of her loved ones that which was not her secret alone.

Another painful hour came. Ilse was sitting late in the evening, as years before, on her chair opposite her father. After her story was told, the strong man looked down anxiously, used hard words concerning her husband, and cursed the other. When he told her that even in her father's house danger threatened her, when he desired her to be cautious at every step, and when he told her that in her childhood there had been a dark rumor that a maiden from the house on the rock, a child of a former possessor, had been the victim of a distinguished prince, she raised her hands to heaven. Her father seized them and drew her towards him.

"We are wrong to forget in an uncertain future how mercifully Providence has guarded you. I hold you by the hand and you stand on the soil of your home. We must do what the day requires, and trust everything else to a higher Being. As for the talk of strangers we care not; they are weather-cocks. Be calm and have confidence."

The younger children chattered innocently; they asked about the charming life at the capital, they wished to know accurately what their sister had gone through, and above all how the Sovereign of the country had treated Ilse, he whom they thought of as a holy Christ, as the unwearied dispenser of joy and happiness. But the elder ones were more cautious in their language without exactly knowing why, with that kind of natural tact which children show towards those whom they love. Ilse accompanied her sister Clara through the upper floor, they arranged the room for the guests who were expected, and placed an immense bunch of flowers in the room which Mr. Hummel was to occupy. Her brothers took her through the kitchen-garden into the narrow valley, and showed her the new wooden bridge over the water to the grotto, which their father had built as a surprise for Ilse. Ilse passed by the swollen brook, the water rushed yellow and muddy over the rocks, it had overflowed the small strip of meadow by its banks and flowed in a strong stream down the valley to the town. Ilse sought the place where she once, under the foliage and wild plants, lay concealed, when she read in the eyes of her Felix the acknowledgement of his love. This cosy nook was also flooded; the stream ran muddily over it,

the flowers were broken down and washed away, the alder bushes covered to their upper branches, and reeds and discolored foam hung round them: only the white stem of a birch rose out of the devastation, and the flood whirled round its lowest branches.

"The flood is passing away," said Ilse, sadly; "in a few days the ground will again be visible, and where the verdure has been injured the mild rays of the sun will soon restore it. But how will it be with me? There is no light so long as he is not with me, and when I see him again how he will be changed? How will he, so serious and zealous, bear the cold wind of adversity that has passed through his life and mine?"

Her father watched her carefully; he talked to her more frequently than formerly. Whenever he returned from the field he told her of the work that was doing on the farm; he was always taking care not to touch on thoughts that might give her pain, and the daughter felt how tender and loving was the attention of the busy man. Now he beckoned to her from a distance, and near him was walking a thick-set figure, with a large head and comfortable aspect.

"Mr. Hummel!" exclaimed Ilse, joyfully, and hastened with winged footsteps towards him. "When will he come?" she called out, with eager expectation.

"As soon as he is free," replied Hummel.

"Who detains him there?" said the wife, looking sorrowful.

Mr. Hummel explained. At his report the wrinkles on Ilse's forehead disappeared, and she led her guest into the old house. Mr. Hummel looked astonished at the tall race that had grown up on the rock: he looked with admiration on the girls and respectfully at the heads of the boys. Ilse did not to-day forget what becomes a good housewife in welcoming a guest. Mr. Hummel was happy among the country people, and delighted with the flowers in his room; he took the sprightly lad Franz upon his knee, and made him drink almost too much out of his glass. Then he went through the farm with the proprietor and Ilse; he was clever in his judgment, and he and his host recognized in each other sound common sense. At last Ilse asked him frankly how he was pleased with her home.

"Everything is magnificent," said Hummel; "the development of the family, their curly heads, the flowers, the cattle, and the domestic arrangements. Compared to the business of H. Hummel, it is like a gourd to a cucumber. Everything capacious and abundant, only to my taste there is too much straw."

Ilse was called aside by her father.

"The Prince is preparing to depart. He has expressed a wish to speak to you first. Will you see him?"

"Not to-day. To-day belongs to you and our guest, but to-morrow," said Ilse.

(To be continued.)

SELECTIONS FROM THE GERMAN.

TRANSLATED BY MARY MORGAN (GOWAN LEA).

XIV.

HOPE.

HOPE on hope falls to the ground,
 Yet the heart shall hope again ;
 Wave doth over wave resound,
 Yet the sea they cannot drain.

Waves shall rise and waves recede,
 Such the life of the great sea ;
 Hearts shall hope and hearts shall bleed,
 Such is life for you and me.

—*Rückert.*

XV.

THE BROOK.

EVENING shadows falling
 Over wood and lea,
 All the world is peaceful,
 Far as eye can see :

All except the brooklet
 Swiftly-flowing, near ;
 Rushing, tumbling, alway
 Are its waters clear.

Evening cannot soothe it—
 Murmuring it goes ;
 Vesper-bell shall never
 Bring it sweet repose.

—*Hoffmann von Fallersleben.*

THE RICH MAN'S QUESTION.

BY MARTHA AGNES RAND.

' SHALL I walk the world alone,
 Leave other hands to mould
 Mankind, and live, a peaceful drone,
 Upon my hoarded gold ?
 Saying : ' Why should I weep
 Because of want and shame ?
 I earned the down on which I sleep—
 Let others make a name.'

" No ! for a by-gone strength has built
 The place of ease that I hold to-day,
 And courage must ever war with guilt
 To how rough steps in the stubborn way
 Of Progress. Then work ! with hand, with brain,
 Ere morning's lustre fade to-night—
 Not for reward or gain,
 But for the soul of Right.

" Shall I say : ' But life is brief ;
 Why strive 'gainst what must be ?
 Best let them battle, joy and grief—
 I walk—unwittingly
 My footsteps doom to death
 A thousand throbbing lives,
 For life and death must mingle breath,
 And thus the great world thrives.'

" No ! there are sickness and sin enough
 Lying plainly before the sight.
 While crime is human, while hearts are tough,
 There will be ever a wrong to fight.

No ! let me weave in the One Great Plan
 My feeble thread of toil, and trust,
 And helpfulness. I can !
 And as I live, I must."

BOOK REVIEWS.

THE PROGRESS OF RELIGIOUS FREEDOM AS SHOWN IN THE HISTORY OF THE TOLERATION ACTS. *Philip Schaff*, D. D., LL. D. New York : Charles Scribner's Sons. Chicago : A. C. McClurg & Co. \$1.50.

In December, 1888, Dr. Schaff prepared a paper upon "The Progress of Religious Freedom as Shown in the History of the Toleration Acts," for the first annual meeting of the American Society of Church History, held in the city of Washington, D. C. The present treatise, the distinguished professor informs us, is an "enlargement" of that paper ; it forms a companion-piece to the essay "Church and State in the United States" ; it is an important chapter of church history, "almost ignored in European works," and never yet the recipient of proper attention ; it can moreover "best be written from the American standpoint because America reaps the benefit of all preceding Toleration Acts and has successfully tested, by an experience of a full century, the system of religious freedom on the basis of legal equality and a peaceful separation of church and state."

An Edict, or Act of Toleration, Dr. Schaff defines to be "a grant of civil government which authorizes religious societies dissenting from the State religion to worship according to the dictates of conscience without liability to persecution." Dr. Schaff begins with the Edict of Constantine the Great, portrays the transition from intolerance of Christianity to intolerance by Christianity, carries us through the Middle Ages, and through Modern Europe to the ending of the religious wars and the Treaty of Westphalia ; and then proceeds onward through the era of secular politics to the present status in Europe and America. Translations of original documents (the Edict of Constantine and the Edict of Nantes) are appended. Throughout, the narrative is accurate and, in the main, impartial. The work forms, in itself, a finished chapter of history.
